FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, $4 A YEAR. 10 CTS. A COPY. SIX MONTHS, $2.

NEW YORK, JULY 30, 1885.

VOL. XXV.—No. 1. NOS. 39 & 40 PARK ROW, NEW YORK.

CORRESPONDENCE.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. Communications upon the subjects to which its pages are devoted are respectfully invited. Anonymous communications will not be regarded. No name will be published except with writer's consent. The Editors are not responsible for the views of correspondents.

ADVERTISEMENTS.

Only advertisements of an approved character inserted. Inside pages, nonpareil type, 25 cents per line. Special rates for three, six and twelve months. Reading notices $1.00 per line. Eight words to the line, twelve lines to one inch. Advertisements should be sent in by the Saturday previous to issue in which they are to be inserted.

SUBSCRIPTIONS

May begin at any time. Subscription price, $4 per year; $2 for six months; to a club of three annual subscribers, three copies for $10; five copies for $16. Remit by registered letter, money-order, or draft, payable to the Forest and Stream Publishing Company. The paper may be obtained of newsdealers throughout the United States, Canadas and Great Britain. Newsdealers in the United Kingdom may order through Davies & Co., No. 1 Finch Lane, Cornhill, London. General subscription agents for Great Britain, Messrs. Sampson Low, Marston, Searles and Rivington, 188 Fleet street, Loudon, Eng.

Address all communications,

Forest and Stream Publishing Co.

ANSWERS TO CORRESPONDENTS.
PUBLISHERS' DEPARTMENT.

"I will not change the terms of the surrender, General Lee, but I will instruct my officers who receive the paroles to allow the men to retain their horses and take them home to work their little farms."—GRANT TO LEE, 1865.

"I have witnessed since my sickness just what I have wished to see ever since the war—harmony and good feeling between the sections. I have always contended that if there had been nobody left but the soldiers, we should have had peace in a year. —— and —— are the only two that I know of who do not seem satisfied on the Southern side. We have some on ours who failed to accomplish as much as they wished, or who did not get warmed up to the fight until it was all over, who have not had quite full satisfaction. The great majority, too, of those who did not go into the war have long since grown tired of the long controversy. We may now well look forward to a perpetual peace at home and a national strength that will screen us against any foreign complication. I believe myself that the war was worth all it cost us, fearful as that was. Since it was over I have visited every State in Europe and a number in the East. I know as I did not before the value of our institutions."—GRANT TO GENERAL BUCKNER, 1885.

BENEATH the mounds at Arlington and on the sunny slopes of Southern hillsides sleep the hosts who fell while the din of battle was yet raging and the issue hung undecided. The transcendent pathos of Lincoln's death was heightened by the untimeliness of the fate which struck him down ere yet his great heart could be gladdened by the coming of good will after the strife of North and South. For the great commander of the Union armies it was reserved to witness the healing of sectional wounds and the final reconciliation of sister States. Not less notable and worthy of remembrance than that grim determination of Grant in The Wilderness, "I propose to fight it out on this line if it takes all summer," and the concession of Grant at Appomattox, "I will instruct my officers . . . to allow the men to retain their horses and take them home to work their little farms," are the words of Grant at Mount McGregor, "I have witnessed since my sickness just what I have wished to see ever since the war—harmony and good feeling between the sections."

THE ILLINOIS GAME WARDENS.

THE system of game wardenship by officers appointed, supported and controlled by the State is making steady advance. First tested in New England, it was afterward adopted by New York, and last winter the Legislatures of a number of States had the subject brought before them. The Illinois Legislature at its last session passed a bill providing for the appointment of three wardens for that State.

This system has been tested far enough to demonstrate its efficiency, provided only that proper persons are given the wardenship. In this State there have been some capable game protectors, and others "not worth their salt." And where protection has failed to accomplish desired ends it has been almost always the fault of the individual, and not of the system.

It is very gratifying that Illinois has taken such a decided by advanced position. The Chicago market will afford abundant scope for the very best efforts of the game protector charged with watching the dealers there. The unequally yoked sportsman and game dealer association organized a few years ago never accomplished anything in the way of stopping the illegal sale of game; such an organized body of men never could do anything effective against the dealers in unlawful commodities. The new State officers, if upright and plucky, will make a change there.

THE MISSOURI CONVENTION.

IT is highly desirable that the game laws of contiguous States should be, so far as practicable, uniform. In no other way can the many perplexing problems of the sale and exportation of unlawfully captured game be solved. In several instances efforts have been made to secure such uniformity. The subject received attention from the National Sportsmen's Association ten years ago, but nothing came of it, because the association paid more attention to trap-shooting than to anything else, and was too unwieldy to work harmoniously and effectively. An attempt to make the Maine and Massachusetts laws support one another failed at Boston last year, because the market interest there was strong enough to defeat the movement. Some correspondence once passed between the Michigan Sportsmen's Association and the sportsmen of Minnesota and Wisconsin, but this also was without any substantial effect. Another effort in the same direction has been inaugurated by the Missouri State Sportsmen's Association, which, at its annual meeting at St. Louis, June 2, passed a resolution that "for the purpose of organizing a permanent sportsmen's convention for the object of devising means by which we can have uniform game and fish laws in all the States tributary to our State, the Missouri State Sportsmen's Association call a convention of all the organized clubs in the States of Missouri, Arkansas, Texas, Kansas, Nebraska, Iowa, Minnesota, Michigan, Wisconsin, Illinois, Indiana, Ohio, Mississippi, Alabama, Dakota, Colorado, New Mexico, Tennessee, Georgia and Louisiana, to be held in St. Louis, Tuesday, Sept. 29, 1885, each club to have two delegates."

As the St. Louis game market is one of the largest in the world, and draws its supplies from all the surrounding States, it is very appropriate that the proposal to secure uniform laws and their enforcement should have come from St. Louis sportsmen; and it is reasonable to conclude that the citizens of all the States concerned will send their representatives to the convention in September 29, to confer for the common benefit.

If properly managed this movement should prove successful where others failed; and the gentlemen who have charge of the arrangements may profitably acquaint themselves with the experience of those who inaugurated the National Sportsmen's Association. If results are to follow the St. Louis convention, two principles must be observed; first to confine the field attempted within such limits that the efforts of the members may be directed to the accomplishment of a well determined definite object, and second, to depend more upon the quiet, earnest work of even a few men who are interested in game and its preservation, than upon the gathering of a large number of delegates more interested in trap-shooting than anything else.

Present effort should be confined to securing uniformity of laws in a few contiguous States. The tendency of many societies in this country is at once to become "national." The only successful way to make such an association as this national in influence as well as in name, is to begin with a scope adapted to its present power, and then, as its strength increases, to enlarge its sphere until in time it may include all the States.

The committee intrusted with the arrangements of the meeting have issued circulars to gun clubs in all of the States named, and anticipate a very large attendance at the meeting of Sept. 29. Among other attractions offered will be a trap tournament of three or four days duration, and the St. Louis exposition will then be in progress. These entertainments for the attending sportsmen are well enough in their way, but not likely to attract the men whose influence and pertinacity must carry through the movement if it is to succeed.

As the representatives from the several States are to come from sportsmen's clubs, the members of these organizations should see to it that the delegates selected are such as have shown themselves interested in the work of game protection, even though they may not be brilliant shots at the trap.

The progress of the St. Louis movement will be watched with deep interest, and the wise establishment of a permanent organization for the purposes named, will be hailed with satisfaction.

The chairman of the committee is H. C. West, St. Louis, Mo.

THE AMERICAN KENNEL CLUB.—That there is pressing need for an association to guide and control kennel matters in this country, no one at all conversant with the subject will for a moment deny. Our correspondent, Mr. Wade, whose communication appears in another portion of this issue, seems to have some doubts that the American Kennel Club will accomplish such a mission. It is to be hoped that these doubts are not well founded, and that the association has before it a long career of usefulness, and that the members of the club will prove equal to the occasion and at their next meeting so perfect their organization and the rules that the most captious critic will be silenced. This is a very easy matter to accomplish. All that is required to place the association upon a firm footing and to make it a power in the land, is a straightforward course of action that shall commend itself to every one as being above all things fair and just to all. There is much of promise for the future of the club in its action in the past in correcting mistakes that have been made. The greatest drawback to its usefulness has been the lack of deliberation that has characterized its actions, notably in the hasty adoption of its first set of rules, and in the hap-hazard manner in which the committees on standards were appointed. In the future all matters coming within the province of the club should be carefully considered so that they may be wisely decided; and the interests of no individual or clique should be suffered to override the rights of others. Then we may look to see the American Kennel Club what it ought to be, second to no association of its kind in the world.

WHY WILL THEY BE SILLY?—Why is it that editors of newspapers cannot find matter enough to fill their columns without repeating from one to another silly stories of toads that have lived thousands of years, sheep that kill snakes by breathing upon them, snakes that sing like mocking-birds, and all the other unnatural features of animal life born of the weak-brained scribblers? The singing snake story started with the New York *Herald*, and is going the rounds of our exchanges. When there are so many facts and principles of animal life that might be published for the instruction and profit of the public, it is a great pity that these lies should have such currency.

THE INDIAN TROUBLES.—It was said in these columns the other day that the cause of the threatened Indian outbreak would probably be found in the aggressions of the cattle men. Such has proved to be the facts. There is manifest at Washington an intention to see justice done in the case, and after the long record of the Government's shilly-shallying policy with boomer invaders of Indian reservations, a different policy will be welcome.

THE BALLAST ISLAND CANOE MEET gave most gratifying evidence of the growth of the canoeing interest in the West. The formation of a Western association was accomplished, and this will doubtless prove a useful and influential body. If the Western and the American associations unite in some way, as we hope they will, the combined organization will be quite unparalleled in size and strength by any amateur sport association in the country.

KILL YOUR FISH WHEN CAUGHT.—It is humane. The fish are better eating. If the fish are not big enough to kill then throw them back into the water and give them a chance to grow. Remember that all fishing is not to cease when you yourself get through.

INDEX TO VOLUME XXIV.—With this number is published the index to Volume XXIV.

...PORT IN THE SIERRAS—II.

...ST now introduce the inmates of this mountain retreat to your readers. First comes Mrs. W., the pleasant and accommodating proprietress, her son Will and daughter O., to whose bow and spear the "Terror" falls a quick and easy prey. There is also a deft-handed kitchen maid, and last, but not least, Old Henry, the hostler and man-of-all-work. The latter is a relic of the golden days of '49, who has been left stranded away up here in these mountains, and who lives here, solitary and alone, to take care of the premises during the long and dreary winter. When I tell my readers that this lasts for six months, and that the snow often falls to a depth of from fifteen to twenty feet in this valley, they can estimate the dreariness of such a life. Henry is a character in his way, and if he takes a liking to one, will undergo any amount of trouble to please them, but if he takes an aversion, and he is prone to do so, he can be as sour as a green crab apple.

The next inquiry is about the fishing, and the answer is that the trout have only just begun to take the bait fairly well and will not rise to a fly at all. Now, although I prefer the clean and tasty fly, and will use nothing else when it is available, still I am like "Nessmuk," and "when a trout refuses to eat a tinseled, feathered fraud, I am not the man to refuse him something more edible." Consequently I appeal to Henry to supply me with some cleanly white borers cut out of a decaying cedar, and start out to catch my supper. This bait, which is much used in these mountains, is the larvæ of coleopterous insects, genus *Cerambyx*, and is pleasant to handle, being dry, and having an aromatic smell derived from the wood which they inhabit. They can be found in all coniferous woods, but those taken from fir and cedar are generally better for angling for small trout, being about the size and color of gentles. The variety inhabiting the tamarack attains the greatest bulk, as they are found as large as a man's thumb in those trees. These are good for lake fishing. That evening I caught thirteen trout in about an hour and a half, and then, becoming tired, returned. The water is too high for successful fishing, and is as cold as melting snow can make it. My illness renders it imprudent to enter the chilly stream, even with wading pants on, and as the banks are very brushy, it is hard work to make a decent cast.

Will and I agree to go after deer on the morrow and give the waters time to subside. Shortly after sunrise we start, taking for our hunting ground a side cañon leading off from the main one, and down which brawls a respectable trout stream. Will takes one side and I the other, with his old deerhound Turk ranging the hills abreast. Shortly after separating to pursue our respective beats, I almost tread upon a grouse having with her a family of ten half-grown young. They take wing with a great flutter and settle in the neighboring trees, where I leave them to grow older and larger. Going on for a while I startle a bevy of cock quail that have gathered into a flock for companionship. In this I have found the mountain quail to differ from his brother of the valley—the latter never deserts his mate or his family, but the former always does according to my observation, as soon as the female commences sitting. I have never seen the male of the larger species hovering around the nest as those of the smaller do, the latter even going so far as to aid his mate in her labor of love. Thus, with mind not altogether occupied with deer, I wander on, interested in all living things around me. The forenoon wears apace, and while standing, trying to catch the hound's voice, which fancy had brought to my ear, I hear a familiar humming sound above my head. Looking upward, I discern the entrance to a wild bees' nest about sixty feet from the ground. I can see the steady stream of workers pouring in and out through a knothole in a massive pine. Adjusting my field glass I stand absorbed in watching them come laden home, panting under their sweet burdens. See that over-ambitious one, that, like the "trout hog," has got more than he can carry. He comes lumbering along on weary wing, and cannot rise to the level of the entrance, and has to alight about ten feet below it, with a force that ought to knock his scanty brains out. There he clings, with his abdomen heaving as though hard put to it for breath, until rested enough to essay another trial. But, hark! while dreaming here Will has got in the lead, and there is old Turk's hoarse bay far up the cañon. With a rush I hurry forward to gain a point from which I can get a fair view, but the crack of Will's rifle tells me that I am too late. My labored breathing also tells me that I must take my time in this rarified atmosphere, to which I have not yet become accustomed. By and by I come up to where Will has a fine young buck with its throat cut and entrails out. Bending down a sapling, we hang the carcass up to be packed out that afternoon on a horse, and return to the house. I secure no game that day in my own name, but am just as well content. It is not all of hunting for me to get game, nor all of fishing to get a creel full.

On the morrow I try the fishing on the stream up which we hunted the previous day, but with small success, the melting snows spoiling this as well as the main river. The trout will not pay the least attention to my feathered charms, "charm they never so sweetly," and with bait only thirty-five small ones were secured. But I have a royal good time nevertheless, for I find some very fine specimens of the scarlet snow-plant, and discover some wild strawberries in bloom, the first I have ever seen in the State.

Once, when tired forcing a path through the refractory willows on the bank, I seated myself upon a rock overlooking a tumbling stretch of water, where the damp sweet spray encompassed me, when a pert-looking water ousel alighted on a boulder within arm's length. He dropped two or three of his graceful courtesies, and then opened his throat in a melodious song. When through, he made another courtesy, ran into the white, tumbling water and disappeared. After what seemed a long interval, he emerged upon the wing some distance up stream and returned to his former position. This time he noticed me, and cocking his head first on one side and then upon the other, as if to reassure the first eye with the evidence of the second, he made a series of dips and flew to the other side of the stream. He then began to scold in a noisy chattering voice, and in an instant his mate flew out from under some old roots near by, and they both fell to abusing me in the heartiest way. Their actions showed that their nest was close at hand, but after a close search I could not find it. Presently I became ashamed of the vile epithets the pair were applying to me in their bird language, and left them masters of the situation. Lovely little fellows, it is to be hoped their parental care was amply rewarded by a nest full of sons and daughters.

To me this has always been a most interesting bird. Found only in the higher mountains, it haunts the streams in their maddest stretches, and where the roar of the waterfall is loudest and its tumbling foam the thickest, there the little ousel will lift its voice in happiest strains. It lives upon the ova and larvæ of water insects, in the pursuit of which it will enter and dash through the white rushing water in spots where it would seem impossible for so small a creature to live for an instant. I have often been fishing some pool at the foot of a fall or fierce rapid, when one of these birds would come flying up the stream and plunge into the water at its whitest point. After a short time it would reappear and again take wing, or alighting upon a boulder, after one or two grotesque bows, would burst forth in a perfect storm of melody. Another trick of his is to apparently commit suicide by deliberately walking into the rushing stream and disappearing beneath its waters. This it does not do by diving, as nearly as I can observe, but by clinging to the bottom with its feet. The ousel's song is sustained and melodious, and would be powerful could it be heard dissociated from the roar of the waters, but I have never heard it sing elsewhere than in spots where the voice of the stream would drown its tones at the distance of a few yards. It is not a shy bird at all; and when fishing one will often see it perch upon a boulder near by, and after a pert glance and a seeming bow of recognition, pour out its very heart in song.

The ousels nest and raise their young close to the waters of the stream, where the air is ever sweet with spray, and the first sound that greets the fledgling's ear is the glorious voice of the dashing water. No wonder that the whole bird's life seems like a living poem. I am told that the ousel lives all through the winter in the same localities, and that in the midst of the howling winds, and roar of the storm beaten pines, his sweet notes can be heard poured forth as joyously to the wintry ice and snow, as if basking in the morning sun of a midsummer's day.

The next day was given to the deer by Will, the Terror and myself, but without result. The dog started one, but ran it away from us, and that was the only one we found. Bear's tracks were numerous, and deer sign very plentiful, but somehow we were not lucky in starting either, and we had to return without game. For the next two or three days there was but little done by any one to pass away the time, shooting ground squirrels being the "best holt." Sunday also intervened, and altogether it was a time of waiting. The waters were subsiding fast, as the snow was pretty much gone except in patches on the higher peaks, and we knew that in a short time the trout would be rising freely, and then for sport.

CALIFORNIA.

THE BUCKTAIL IN FLORIDA.

VIII.

THE three long hot months that I passed in camp at the Oak and Pine, ostensibly outing for health, form an episode in the later life of one old outer that will not be soon forgotten. It was not hunting, fishing, nor canoeing, though a good deal mixed with the latter. It was outing past a doubt. Also loafing, even as the moneyed man loafs from resort to resort, spending a few weeks or months at each, striving constantly for something entertaining or amusing, but being envied oftener than amused. I had the advantage of having always something to do, cooking, fishing for a camp supply, fixing up the camp and writing; the last under difficulties. For it is not conducive of literary effort to write with one hand, while the other is busily engaged mopping the face or dispersing greedy insects.

But I never suffered from *ennui*. Even in the hottest nights, when the sun had been blazing on the roof of the shanty until it was like an oven until long past midnight, I did not find the time hang heavy on my hands, nor was I troubled with loneliness for a single hour. The shanty seldom got cool enough to sleep in before 1 o'clock in the morning, and I amused myself, on moonlit nights especially, strolling about the open woods and listening to the many voices of the night. On dark nights I kept up a bright, light-wood camp-fire, and "Tarpon" (Capt. Kendall), who lived less than a quarter of a mile distant, usually came over in the evening to occupy one end of the smoking log and spin yarns, and truth to say, he spun them well. For the man who has been down to the sea in more than forty ships, and has seen the wonders of the deep in Arctic and South Sea whalers, on slavers and men-o'-war, in coasters and clippers, not to mention canoes, such a man is an epitome of romantic reality, so he can but talk, which few men can. "Tarpon" talks well when once started, wherefore I let him do most of the talking; and he tells me on one evening of his thirty-seven weary months on the old Vigilant, 4-boat, Pacific whaler, from New Bedford; and again of six months on an Arctic whaler, where, though the weather was sometimes fearfully cold, he had a right pleasant voyage. Then he has a fund of interesting reminiscences connected with his residence in Payti, Peru, where for over four years he filled the role of a leading "beach comber."

When Dr. Neidé's book, the "Cruise of the Aurora" came out, he was greatly interested, as he well might be, for he was a partner of the Doctor's in that cruise, the "Barnacle" of the book, which he read and re-read, then loaned it to me. I found it so interesting that I read it through at one sitting, for "Barnacle" had told me all about that cruise months before around the camp-fire, and I was curious to see how two veteran canoeists would regard and speak of incidents familiar to both. On the whole they saw things in about the same light. The Doctor logs the voyage as he made it, and perhaps it was not necessary to mention the fact that Mrs. Kendall cruised in the Comfort from Olean to Cincinnati, taking her share of the haps and mishaps of camping and cruising; nor that "Barnacle" had already cruised over 500 miles when joined by the Doctor at Lake George; nor that, after the Doctor hauled off at Pensacola, "Barnacle" continued the cruise 360 miles further down the coast, stopping at Tarpon Springs some time in March.

Chatting by the camp-fire one evening, "Barnacle" recurred to the cruise about as follows: "When we started from Lake George our cruise was mapped out to include the Allegheny, the Ohio and Mississippi, the Gulf coast to the Florida capes, around the capes into the Atlantic, up the Atlantic coast to New York, up the Hudson, and so home to the starting point on Lake George. This would make by far the longest canoe voyage on record; and I cannot say, even at this day, why it was not carried out to a finish. The Doctor hauled off at Pensacola—I never asked him why—and I continued the cruise to Tarpon Springs, where I made a halt that was not intended to be anything permanent, however. Opposite Crooked Island, some 200 miles below Pensacola, I was struck by an off-shore gale which blew me out into the Gulf, and I was eight hours out of sight of land under paddle. It was a weary day for me. But the Comfort proved herself an able sea boat, and I got back to land just at night, going ashore in St. Joseph's Bay, 160 miles above Tarpon Springs. Why I have stopped here for two years is more than I can tell. But the rest of the cruise is only postponed, not abandoned. You have seen the model of the new canoe I am building? She will be an abler boat than the Comfort. And she is meant to cruise from this point to Lake George via the Florida capes, the Atlantic coast and the Hudson. I note that a very pleasant writer in the *Canoeist* speaks of the Aurora's cruise as the longest made by any canoe. Perhaps he does not count the Comfort as a canoe; but she made the entire cruise with the Aurora, with 500 miles to add at the start and 360 at the finish."

It was on the third of July that we started down the Anclote on the ebb tide, bound for Dunedin and the regatta that was to come off on the Fourth. The sharpie had been a long time getting ready. She was launched last New Years day, and was not really fit for a cruise yet. Her cabin leaked, her sails did not set well, and in putting in her limestone ballast we had managed to give her a list to port. Also, her flooring and lining was loose and dirty, and she had no fittings nor furniture, save candle boxes, cracker boxes, etc. But we decided that her sailing gear would do, and it was no hardship for two old cruisers to sit on cracker boxes or sleep on the after-house with the standing lug bent over the main boom for a shelter from sun and rain. So she went. Down the tortuous channel of the Anclote, the wind blowing us up, the tide dragging us down, and getting aground oftener than was pleasant. But she was light, carries a long setting-pole, and Capt. Tarpon has good muscle, so we soon got off, and at 9 o'clock of a dark evening tied to the little wharf at Anclote village. The afterguard (Tarpon) went ashore to pass the night with friends, while the cook and for'ard hands (that's me), made up a bunk and slept on board.

At early dawn the captain came down to the wharf and hailed, whereupon the cook promptly turned out, started a fire of barrel staves in a shallow box of sand for galley, and in a few minutes had a pot of strong, clear coffee. Then we cast off, and with fair wind and tide soon rounded the pier-head out into the Gulf. Just then two lively sloops from the Springs hove in sight as they rounded a bend in the river a mile astern, and stood for us. One was the cutter Vanessa, built in New York; the other the Tantalus, a coaster of shallow draft and much centerboard. The latter was white, with new, well-fitting sails, and she looked very natty in the morning sunlight. They headed for us with everything set; but, rather to my surprise, could not gain an inch; rather, of the two, they seemed to lose ground. And this in spite of the fact that our sails set badly. Our mainsail had six or eight inches of loose leach and our standing lug too much canvas, making her carry her helm a-weather and drag her rudder. New rigs mostly need overhauling before getting into good working order. But the sharpie really glided over the smooth, shoal waters of the Gulf like a duck, and we came to anchor above the wharf while the sloops were a mile and a half away. We had towed the Bucktail all the way, with the little Rushton nested inside of her, and when everything was made snug we took the canoes and paddled ashore, the "captain's gig" being, of course, the Bucktail. Dunedin is a small place now, but there was no lack of people there on that day, and the preparations for fun and frolic were admirable. As we landed we saw a crowd rushing for the wharf, and followed to see what was up.

It was a ham that was up, on the end of an upright post. And the post was firmly fastened to the extreme end of a long, peeled, and well greased slender tree-trunk, which projected from the judge's barge far out over deep water. The little game was to walk barefoot out to the upright post, lift the ham, and walk safely back with it. He who could do this could carry off the ham as a prize. As we came up the crowd was convulsed with laughter, the tree trunk was vibrating gently up and down, while two lusty lads were floundering in the water. It was fun to see a confident acrobat start out from the barge for the ham. So long as the trunk was firm and level he could manage to keep his footing, but, as he got where the peeled tree began to bend there was a gentle sliding motion, the legs began to spread as of their own accord, arms were thrown aloft for ballast, the glide increased to a glissade, and over he went with a heavy splash. When the sport began to grow tame the boys were allowed to sand their feet, and the ham was soon captured. Then there was a well contested sack race, in which the contestants made excellent time. And a pig was greased and turned loose for the boys to catch and hold. I did not think any ordinary crowd could catch a Florida pig, and would have taken a small wager that he got away. But circumstances were against him. He had too many kinks in his tail, and the sand was too dry and deep. At first he looked a winner all over, but much dodging got his grease mixed up with sand, and then the cute lads threw sand at his counter, until a cracker lad fouled him by one of his kinks and brought him to anchor, fighting and squealing like a fiend.

What pleased me most was the hearty interest and love of innocent sport shown by judges, assistants and all who had a hand in directing the proceedings of the day, and the good nature and sobriety of the entire gathering. I did not hear an ill-natured word nor see an intoxicated man during the day. The main event, the regatta, came off in a light breeze, but was sailed fairly and without any unpleasant feature, our white friend, the Tantalus, winning in the first class and the yawl Nellie in the second, the latter leading everything over the course. I had supposed that the sharpie was to enter for the race, and was rather disappointed when the captain declined to enter her or let the for'ard hands do so. So I got into the Rushton and raced the racers, as they stood past the barge in a light wind. I held way with them, too, until the wind freshened, when they soon left me astern.

It goes without saying, that in a country where the lightest pleasure boats are made to weigh from 150 to 200 pounds, a canoe of ten pounds weight is almost marvelous. "Tarpon," while standing on the wharf, heard a cracker explain the matter to a knot of listeners something like this: "You see," he said, "'taint no great trick to handle that little boat, once you know how. Every time one end of his oar goes up t'other comes down—to balance. Now if he should stop his paddlin' a single clip, he'd upset." Just then a lady spectator on a beamy schooner offered me a fine slice of melon, and I laid in the paddle, let the canoe drift, and enjoyed the gentle motion of the swell while eating it. The

cracker was utterly nonplussed, and walked off muttering, "Dog on it; but that is a neat little trick." I think the baby canoe, as "Tarpon" calls it, attracted as much notice as all the other craft in the harbor.

At night there was an old-fashioned southern country dance, and I ought to have been there. But I had been on my feet or in the canoe from early dawn until sundown, and was so tired that even the attractive strains of "Money Musk" and Fisher's hornpipe could not induce me to paddle ashore again. And "Tarpon," who rather wanted to take in the dance, finally agreed that the more sensible course was to get a powerful cup of tea, turn in for an all-night watch below, and be on hand for an early start to Big Pass in the morning, where we are to anchor or moor near the clean beach for a day or two, gather shells on the outer beach, and shoot snipe, plover and sickle-billed curlew to our hearts' content; with a possible chance at roseate spoonbills. And so with the distant fiddles squeaking faintly on our ears, we take either side of the after house and sink to sleep under the shadow of the standing lug, to dream of Big Pass, Little Pass, the Fishery and other spots we propose to visit on this, the trial cruise of the Nessmuk. For that is the name that floats from her truck in bright scarlet letters. A compliment for which I am indebted to Mrs. S. D. Kendall, who worked the same with her own deft hands before she had ever seen me. May she live to paddle her sixteen-pound canoe long after I am gathered in. NESSMUK.

FROM TOLUCA SOUTH.

BEFORE beginning to tell the details of a perhaps uneventful mountain ride, it is but just to give one or two friendly warnings.

First, this recital bids fair to be very instructive, a thing repellant to minds of an independent turn. Then, probably, others who have been before me have given all possible information of this country and this people. Humboldt, in particular, whose genius for detail is so great that if he had facilities for publishing we should now doubtless be well acquainted with all the peculiar features of the next world—Humboldt, I repeat, has passed this way. I console myself by thinking that others like myself know of the great man by repute, but have never read his works. Then, again, as I go along I shall often be forced to use many names that convey little or no meaning to the foreign ear. The Mexican idiom has left, even in dying, deep marks on the language of the country. Names of familiar and domestic objects are often derived from Indian words, and names of places almost always have this origin. Some of these words, such as Almoloya, are soft and liquid, while other towns, such as Tescalteclan and Ixtlahuaca, tangle the unpracticed tongue.

"Their uncouth names of prehistoric mould,
Clinking like hammers in an age of stone."

One thing more and I begin. You must expect no exact measurements. Those who try to give just measure are liable to be corrected. This unpleasant thing happens to scientific men of the first rank every day, but one can't be critical about a humble guess. The most captious person would waste his pains at this as much as if he were trying to spoil a defective egg.

At Toluca, the capital of the State of Mexico, not remarkable for anything except its beautiful market, I found myself in June, 1785—perhaps it was 1885. A century more or less does not make much difference in Toluca.

The market is a long paved building, with four rows of short stout pillars running lengthwise. The roof in the center is paneled in brick red. On each side of this paneling, between the two middle lines of pillars and the two side lines, there are glass skylights, and then solid roof again from the flanking pillars to the outer walls. The whole is painted in simple striking designs, and is not only good in itself, but all the more welcome for being unexpected.

If you have to buy a hat in Mexico you will find that a head that at home is small will yet surpass the size of the native head. To compensate for the small hat band there is a wide brim and a lofty crown.

In the evening, on entering a cheap café to hear some very fine music played on instruments of the nature of the guitar, it was explained to me that there are three grades of harsh alcoholic drinks distilled from cane juice. The best is "catalan." It is said that if you hold a glass of catalan to your ear you can hear the contents hum. It is possible one might hear the glass hum after emptying it of liquor; but the other statement is exaggerated. Next in grade comes "resacado," while at the bottom of the series stands a still coarser drink whose name I forget.

After thus sounding the resources of the town, I set to work to buy three horses; one for myself, one for my effects and one for the mozo who was to take care of them. It needed both patience and decision to select, among the animals offered, those least bad. I bought a little, skinny roan, with eyes like a rabbit's bulging far out, and seeing more than he ever spoke about, for a pack horse.

I rescued a gray mare from sacrifice in the bull ring for my man to mount, and for myself got a black, large and sleek with a good character and an easy jog. I will not tell the price of the stud for fear you should think the animals contemptible. Some such suspicion lurked in my mind at first. Still, to give you a rough notion, you may know that, after subtracting the cost of my cavalcade, saddles and all, from a hundred dollars, there was a pleasing remainder. In one point only was I deceived. My own charger, whose pace was as swift and pleasant as a mule's, proved to be foundered. His legs were limber and his gait graceful, and he did not show his disease until he got to climbing mountains, when his respiration rose to near two hundred and fifty pants a minute, and his progress grew slow in inverse proportion.

My mozo, Gumecindo, was not a packer by profession. Indeed, he turned out to know nothing of that delicate art. He began his service with the seeming intention of being a patronizing if incompetent adviser. His manners were very grand and his tone a condescending chant. It needed, however, only a blunder or two with the ropes and a little neglect of the horses to alter our relations seriously. His aristocratic bearing would fade, and only freshen again when healing time allowed him to forget the past. Yet the poor fellow made me half ashamed of myself on one occasion. For the purpose of a flying trip to Tasco I took another boy for guide, and left Gumecindo behind for a day because his horse's back was sore. Just before we started out Gumecindo came to me and asked that, in view of the disability of his horse, he might be allowed to accompany us on foot that he might continue to watch over my welfare. Fifty miles on foot over such a trail!

Loading upon the roan a bag of bread and two boxes of claret, which ought to have been cheap, but was not, we set out across the valley. After a time we began skirting the volcano and soon rose among the pines. The volcano, called, according to a geography I carried, Xinantecatl or "the naked man" by the ancients, is somewhere about 14,000 feet high. On one side of its ridgy crest snow is always to be seen. Its fires have long been dead and in their place two sheets of clear water fill the old craters and send down their overflow to freshen the lands on every side. Toward Toluca comes a small stream. Two considerable rivers unite at Temascaltepec, and further south, at Tenancingo, the cool waters still come from the same source. I was told that the first discoverers of these lakes found there the shattered pieces of an old boat with its iron fastenings lying around. Like many other things supposed by the people to be relics of the ancient races, the remains spoken of in this story must really have been of Spanish origin, for iron was unknown before their coming.

Up in the forest woodchoppers were at work cutting and fashioning lumber. The axe is a queer instrument not more than three inches broad at the blade and nearly a foot long; but, clumsy as it is, it is well handled, and excellent results are got. Trains of Indians passed laden with burdens. Most of the loads were put in a device called a "huacal." This is an osier cage some three feet high and two feet wide and deep. Usually the "huacal" is divided into two or three stories. The lower floor is perhaps crowded with live hens, then there will be a compartment full of eggs, with an assortment of fresh vegetables, or new crockery on top. The carriers get their stock together and set out on a long tramp, so timing their start as to get to some town on the day of the week consecrated to the "plaza" or public market. Then they sell their cargo and walk back.

It was rainy and cold when we got to a straggling settlement called Meson Viejo. The roofs looked leaky, but we could get no further that night, so we took our chances and were happily dry.

There are four principal kinds of roof in this part of the country. First there are the red tiles, half cylindrical in form. These are laid overlapping, first in rows with the concave side up, and then, over the edges of these, in rows with the convex side up. The effect is both good for shelter and attractive to look at; loved equally by the artist and the practical man. At the other end of the series is the thatch roof of grass or palm leaves, set with a steep slant, dirty, ineffective and used only in the poorest houses. Between these extremes are the roofs made of "tejamaniles." These are long shingles, perhaps six inches wide by three feet in length. I think what we call shakes are about the same thing. "Tejamaniles" are fastened either by boring holes and driving in long wooden pins which are left uncut (so that your roof looks like a great harrow slightly tilted), or by the simpler method of weighting the roof with stones. The roofs at Meson Viejo were loaded with stones. It looked as if a new Deucalion had been scattering the seed, and the classic parallel was made more striking by the great number of infant Indians that seemed to have sprouted under the thick strewn rocks.

The next day, after going over some hilly ground, we got to Temascaltepec, in the edge of the mineral belt, for here little ore is found either on the Toluca peak or its higher spurs. On the lower ranges that lie between here and the coast are the principal mines of this and the adjoining districts.

It would, of course, be indelicate and perhaps uninteresting in a mining expert to tell "the secrets of the prison house" and other professional matters. In these I keep discreet silence, but the town has other features which repay attention. We have got low enough now for the tropic sun to show its influence. Up the steep sides of the barranca, just below where the two rivers flow together, wide banana groves wave their great leaves. Coffee trees are planted among the bananas, giving fine fruit and yielding good returns. Corn here as elsewhere, is the main stay of the people, and it is striking to see what ungrateful soils are tilled. As little manure is used, the fields have to rest long in fallow, but, with this exception, the cultivation is close. Side hills a man can hardly climb, and which only the ox reared in the mountains can plow, are green with corn. I have seen, in limestone regions, fields so full of boulders you could scarce see the soil, and yet between the rocks stood the withered cornstalks of last year's harvest. Nor is there any lack of necessary attention to growing crops. There is careful system on the contrary. While the stalks are short enough for the ox yoke to pass over, there is frequent ploughing, and after that the ground is hoed. The wooden ploughs of the country are effective in light soils. They do not turn the furrow over as a mold board does but they stir deeply. Even the antique style of threshing by driving cattle and horses over the grain does not turn out so badly as one would think. Another sign of the careful use of the land is the extent of the "rozas," the burned over clearings on the mountains, where only a crop or two can be raised, after which the land lies idle till another growth of brush is ready for another burning. You will often see a distant range checkered over clear to the summit with the bare squares of former "rozas."

Among the fruits that are unusual with us comes first the "zapote." The tree is larger than any walnut I ever saw, open and airy, and the fruit is about the size of a large pear. Inside are two or three pits that together take up as much room as a turkey's egg. The meat of a ripe zapote is soft and sweetish; neither dry nor juicy, but of that consistency of fibrous custard which is met with in so many tropic fruits.

Then you have the "aguacate." On a tree not unlike a small chestnut grow dark green spheroids about the dimensions of an average potato. Aguacates, too, have large stones, and besides have a tough rind. Between the two lies an oily pulp which goes far to replace butter. It is just the thing for salads.

Further south is the land of the "mamey." These have the shape of a small cocoanut, four to six inches long, a rough, brown skin, and the usual enormous seeds. The flesh is like a pumpkin pie. Good mameys remind you of good pies and bad mameys of poor pies, but the comparison is quite exact throughout. An intelligent friend told me that it took four years for the mamey to develop from the flower to the ripe fruit. This may be so in unfavorable places, but in hot land a few months only are needed.

There are two kinds of wild cherries here, highly prized. "Capulin," a red berry growing on a large tree, and "nanache," a yellow berry, on a much smaller tree. Both have the astringent taste of our choke cherries, and have hardly more juice.

A day's ride from Temascaltepec led us over a high divide and down into the plain where Almoloya stands. On the mountain here, as in many other places where the rock is soft, the trail was so deeply worn in spots that a horseman could not see over the sides of the banks. Near the towns, too, the roads were often paved for a long way. Of course I do not mean that a wagon could be driven on such pavements. So steep and rough were they sometimes that one could only ride down with great danger to his horse's legs; still it shows that great labor has been spent, where necessary, in preserving the scanty lines of travel the country owns. On the roads called by courtesy "caminos reales," royal or main roads, you meet many solid masonry bridges connecting paths little better than cattle trails. Probably much of this work was done by forced Indian labor. The odious methods of the present government in that regard show too clearly what the past must have been. When the roads now need repair, the local magnate sends to the leading men of some Indian village, bidding them do the job or go to jail. Not only are the poor creatures paid nothing, but they are not even supplied with tools. They are forced to cut stakes, and, hardening the pointed ends by charring them in the fire, get on as best they can with these miserable makeshifts.

As you ride through the level land toward Almoloya, you find, for a wonder, that the villages and churches stand a little way off the main road. All the fertile bottom seems to be utilized; grain and corn growing right up to the walls of the houses.

Almoloya was full of festal visitors when we rode in. There was no room either for man or beast, and we went on to a little store at the hacienda of Los Arcos.

Here we had various fortune. We were treated first to "té limon," a drink made out of a kind of grass. There are three principal kinds of herb teas here in use. Té limon is cultivated in gardens and dried. When steeped it has a flavor that reminds one of lemon verbena. Then you have "té yerba buena," made by steeping while green a plant that resembles mint. The infusion, however, has hardly any taste at all; "té del monte," made from the dried leaves of a wild bush, is better than either of these, and the three varieties, called from the colors of their flowers red, purple and white, are prized in the order named. Sometimes a tea is made from green orange leaves. To my palate hot water is more agreeable.

To compensate for the pleasures of "té limon," we were at Los Arcos infested with pigs. Of all God's creatures, I most loathe a pig. Dead pigs, like dead Indians, may have their good points, but for the living my sentiments are little better than those of a Jew. Their snuffling, grunting, and the slobbering smack of their filthy chops arouse in me a feeling of dislike. Most of the pigs at Los Arcos, though living in the parlor during the day, retired to a separate room to sleep. Two or three favored ones, however, kept going the rounds for hours after the others had gone to rest. As a measure of protection I gathered a pile of firewood, laid it near my hand and discharged this artillery at every grunt I heard in the darkness. At last we had peace. My kindly host, though perhaps pained at the ill-treatment of their pets, wished me all sorts of good fortune the next morning, and I, far from complaining, pocketed my pig grievance and answered with Castilian punctilio to their graceful compliments. One thing I forgot to say about Temascaltepec, viz., that the withers of the horses were there badly bitten by bats. We guarded carefully against this misfortune for the future, and it did not occur again.

And now one day more of mountain travel and we reach the town of Zacualpan. On the road I saw the only wild animal, with the exception of one small deer, that I met during the trip. He was the size and shape of a fox, both as regards the head, the tail and the body, but his color, instead of being rufous, was of a steely gray. The natives call the animal a "cacomistli."

The town of Zacualpan cannot be hid. It is set on the very summit of a lofty hill. It makes one tired merely to see the steepness of the streets, and a Mexican there on a visit told me he got quite foundered in going to his sleeping place. He was lucky, however, to find any place to stay. Though the town is large, so few people come there that only the casual kindness of heart of some benevolent citizen rescues a stranger from the street. It was not till we enjoyed the hospitality of the hacienda in the ravine below that we were in any position to judge of the advantages of the country.

The mountains around are bored and burrowed into on every side. Immense amounts of labor have been done, and you hear tales of several old-time miners who took many millions in silver from the ground only to end in aged helpless poverty.

Now we draw near the State of Guerrero. The road to Tasco is one of the most beautiful paths a man need wish to see. Almost all the way you ride through the shade of oak forests. More than thirty kinds of oak are said to grow here, but they do not have the rugged look of their English cousins. Crowded close together, they shoot up tall and nearly as straight as pines. Orchids and trailing mosses drape and swathe the trunks and branches, and ever and again you catch glimpses of the red boles of writhing madroños hung with tattered bark.

From the lofty ridge of the Mount of Temptation, at a place called the Devil's Balcony, whence you can see, if not all the kingdoms of the earth, at all events a great expanse of republican land, the traveler looking east is faced by the tall crest of the Toluca volcano. The twins of Puebla, the White Woman and the Smoking Mountain, rise above the line of the range further to the right, and on clear mornings, before the heated air begins to shimmer, you can see the faint-drawn, sharp point of Orizaba piercing the southern sky and ending the line of sleeping fire.

As the ride draws to a close you pitch down a long descent. At first a few churches to the right catch your attention, and you think half an hour will bring you to the town. Then you see a settlement nestled on the slope far across the valley and your hopes of a speedy arrival are chilled. On a sudden you turn a point of rocks and the red towers of the tall, narrow-chested façade of the cathedral rise before you with such a determined front that you stop half startled. This is Tasco beyond a doubt.

The town now lives mainly on memories of the past. In the cathedral hangs a portrait, beneath contempt in execution, with a writing below that tells the reader that Don José Borda built the church out of gratitude for divine favors shown him in the getting of wealth. The outside of the building is not all in good taste, but was clearly costly. The fine red stone was brought from far, and is elaborately carved to the top of the bell towers. Statues in the same stone are clustered around, giving an almost confusing effect of detail. The nave is high and narrow. The belfries much higher and, instead of tapering, swell slightly as they go up.

As you look down from the trail, the dominating mass of the structure seems to be crushing the back of the crouching town. Inside all is tawdry; rude wooden angels with puffy cheeks painted and gilded as if bound to a ball. On each side of the door hang numbers of offerings to various local divinities. I say "local" because, although all bear the names of "Nuestra Señora," or "Nuestro Señor," those titles are qualified and limited often to some small village, so strong is the survival of pagan thought.

The offerings consist mainly in small oil paintings of "moving accidents by flood and field," of scenes of illness deemed mortal, in most cases with a cross or a Virgin appearing in one corner framed in a glowing cloud. Absurd daubs nearly always, with legends below telling, with ill-spelled simplicity, some story of rewarded faith.

In a church in Tenancingo, which had, by the way, the best pictures I have seen in the country, hung, among other little squares of canvas, one picturing two riders and a pack mule a good deal embarrassed by high water. It was a sample taken at random, and I give the legend as it stood for the instruction of those who care to decipher the faulty Spanish:

En 6 de Otubre de 1805 *allandose en peligro de la bida Dn José juaquira destrado y su moso pedro franco en las orillas de Samoro 4 dias por agua y in bocando a Na Sa del Calvario de tenancingo y al Sr de Chalma saliron libres a quienes dedica este.*

"On the 6th of October, 1805, Don José Juaquira Destrado and his servant Pedro Franco, finding themselves in danger of their lives for four days, by reason of floods, on the border of Samoro, and invoking the aid of our Lady of Calvary of Tenancingo and our Lord of Chalma, escaped unhurt. To them he dedicates this."

I have spoken of the picture of Borda. Let me say a few words about his life, more wonderful than romance. Joseph Laborde was a poor Frenchman, who many years ago came hither. He began mining; worked in many different States and on many different veins. The records are said to show that, as a consequence either of luck, skill or instinct, he took from the ground over two hundred millions of dollars of bullion. In Tlalpujahua alone the "Borda" mine (for the Spaniards had altered the original name to suit their tongue) gave over thirty millions. Tasco shows as large an output, and Zacatecas and other States must make up the remainder.

Laborde fancied that he had a mission from God to put these hidden treasures into the hands of men. It was also a part of his mission to further the cause of the church. Of the many temples he built to God, the cathedrals Tlalpujahua and Tasco are the most considerable. But he did not confine himself to building. He founded colleges, he educated armies of priests, he provided rich vestments and sacred vessels. On one occasion when Laborde was ruined by the long barrenness of his mines (for he was not without reverses), the Archbishop of Mexico gave back to him a "custodia" or box for holding the consecrated host, which Laborde had had made at the cost of a hundred thousand dollars. Selling this he got money to keep on and at last found again his lost bonanzas. At the end he died poor, having devoted so much wealth to pious uses that his family were left in need.

Tasco, though shorn of its former glory, still has claims to respect. Water is brought from the higher mountains in an acqueduct built by Laborde, and through its masonry pipe goes growling and rumbling down the steep incline. One conduit leads to a long stone tank where the women gather to wash clothes, another to a public horse bath, also of stone, and still other streams flow to the fountains and basins in the square. The pavements are laid in patterns, hard black pebbles being used to make the design or a name or date as it happens. Food, if you get it, is cheap. My meals, which were the most luxurious the place afforded, cost me fifteen cents apiece. The boy who served as guide dined with me, and it was curious to watch him at table. For a moment he eyed the unusual apparatus of knife and fork with distrust. His mind was soon made up. Bravely and without embarrassment he knocked a hole in his eggs and sucked them. Then he carved his fried potatoes and chicken and what not with his fingers, and did very satisfactory work.

My sleep was bad owing to foreign invasion. In the morning I reproached the landlady with the plentitude of bedbugs; but she soon convinced me that I was mistaken, "For," she said, "the room next to yours, which is locked, is the one that is full of bedbugs. Here there can be only fleas."

NIGHT HAWKS NESTING.

THE night hawk (*Caprimulgus virginianus* Kirtland) has within a few years made a new departure here in locating its nest. I cannot say nest building, as I have never met with its eggs protected by stick, straw, or material of any kind whatever. Six years ago I found a pair nesting on the tin roof of a public building in the heart of the city. The eggs, two in number, were laid by the upper side of a chimney; a fortunate choice of place, as the rain would quickly drain off, and the eggs, if undisturbed, were safe from a roll into the gutter.

Three pairs of these birds now nesting on a slate roof of a prominent building thirty rods from where I am writing have given me, during the season, a fine opportunity of watching their maneuvers. They arrived the 30th of April, and for several days made merry over the place as if uncertain about choosing the location. By the 6th of May and after this date they might be seen about 5 P. M., rising from the roof together as it were at the word go! and cutting antics and gyrations that would do credit to any bird on the wing; in fact, I know of no other bird that can excel him in flight, the albatross or frigate bird even, I doubt, can more than equal him on or with the wind in rapidity of flight or aerial maneuvers. Until long after dark these flights are maintained seemingly for amusement, perhaps for the entertainment of the partners that are caring for the eggs below. When the moon is full, the well-known *speek, speek,* can be heard at all hours of the night and often after the sun is well up in the east. The number of nocturnal insects destroyed by these birds must be enormous, judging from the appearance of the young. I have met with many of them and always found them featherless and fatter than any other callow bird it has been my fortune to observe. Their rapid and irregular flight makes them a difficult mark for the young sportsman to practice on, as he never fails to make a target of them when the opportunity offers. I can now understand the object for which this bird was created.

Last summer, while walking through the grounds of the Lake View Cemetery, I found a nest of this bird on a barren knoll not fifty feet from the main drive and foot way. Stepping to the spot the bird only left after receiving a careful push of my foot, she mounted quickly high into the air in a manner that spoke of no immediate return. While examining the two eggs as they lay on the bare sand, the bird suddenly made her appearance, flying close to my head as though to attack, then tumbled to the ground to roll and perform all the antics common to the ground-nesting species. We left the bird covering her nest and learned subsequently from the guardian of the grounds that she raised her young undisturbed, for the reason, as he remarked, "no one else ever discovered the nest, or the eggs would soon have been gathered up and blowed for some naturalist's cabinet." The question is what induced this bird to nest in such an exposed position, the knoll was as clear of grass or other obstruction as a new laid sea beach, and close by hundreds of foot and carriage passengers went daily. It is not uncommon for ruffed grouse, quail and other ground-nesting birds to nest in close proximity to well beaten paths, but in all these cases we find the bird and eggs well concealed by surrounding grass or bushes.

CLEVELAND, O., July 23.

THE BIRDS OF MICHIGAN.

BY DR. MORRIS GIBBS.

(Continued.)

46. *Dendræca cærulea* (Wils.) Baird.—Cærulean warbler; blue warbler.

A locally distributed bird. Perhaps common in certain sections, but certainly not abundant throughout the State. Many observers have never taken it, and it is first reported as a bird of Michigan in 1878 by Covert, who later, 1881, in his "Birds of Washtenaw County," says of it: "A very common summer resident; breeds, nesting in the tops of tall trees." Embraced by but four lists, and only given as a summer sojourner in two catalogues. Dr. Atkins, of Locke, Ingham county, is the most northern observer, about 43° north latitude, and he only mentions the finding of three specimens in his twenty-nine years of observations. Mr. Jerome Trombley, of Petersburgh, Monroe county, in the extreme southeastern portion of the State, gives a very valuable description of this species in his notes of the warblers of the county, sent to me, 1881. He says: "This is one of the most abundant of the warblers in this section of Michigan. There is near here a piece of heavily timbered land of about ten or twelve acres extent, where I will venture to say there are each year not less than twenty pairs of these birds that breed. They abound more or less in all of the woodlands of Monroe, Wayne, Washtenaw and Lenawee counties. They appear from the south from the first to the sixth of May. It may be truly said to be a wood-inhabiting species, as I have never, in all my observations, seen more than a dozen specimens outside of the woods. During the time they remain here they haunt the tops of the tallest trees, and while feeding seldom descend nearer than twenty or thirty feet of the ground. While nesting, they necessarily come to the ground after building materials, and this is the best time to secure specimens. They are very shy and suspicious at all times, and difficult of approach, a habit which, as is well known, is contrary to the nature of the greater portion of the true wood warblers.

They usually begin nesting soon after their arrival here, or about the 15th to the 20th of May. The situation of the nest is different from all the authentic accounts which have ever come to my knowledge. Audubon describes it as being placed in a low tree or bush and partly pensile. In Vol. IV., No. 1, Nutt. Orni. Bull., is an article on the "Nest and Eggs of Cærulean Warbler," by J. A. Allen, in which is given the record of three nests. One nest situated sixty feet from the ground more nearly accords with all those I have seen in this section. All of my nests were not less than forty feet up, and from that to seventy-five feet from the ground, and invariably placed on the upper side of a branch, generally a fork formed by smaller limbs shooting up from the main branch. The first nest I discovered was forty-five feet from the ground, in a basswood, and contained eggs just ready to hatch; the next was built in a maple, all of fifty feet up, on a branch, and contained four fresh eggs. Another nest was quite seventy-five feet from the ground, in an ash, and placed at the extremity of a small limb. All the nests agree in size and construction with those described in the *Bulletin.* The outside is composed of fine dry grass, strings from plants, caterpillars' silks, spiders' web, and an occasional shred of moss and bits of inner bark. The lining is composed wholly of fine strips of the reddish outer down of fern stalks. One of the nests is covered on the outside with a few grayish lichens. The nests are about of a size, measuring 2¾ inches outside, by 2 inches inside diameter, and 1¾ inches in height externally by 1½ inches inside. The eggs are dull white with a faint yellowish tinge. The markings are small spots, specks and blotches of a reddish brown, the bulk being disposed about the greater end. The measurements are, averaged, .60x.48 of an inch. The cærulean warbler remains until about the 25th of September, and by Oct. 1 they have all disappeared."// My experience with this species is extremely limited, having only met with it on one occasion. On May 11, 1884, I shot a fine male which was singing in a small tree near the banks of the river in a low woods. The song was *tree-tree-tree-tree-tree-tree-zweeeee,* and quite agreeable. The bird was active in its motions and appeared a typical warbler.

47. *Dendræca pennsylvanica* (Linn.) Baird.—Chestnut-sided warbler.

In the early days of ornithology in America, this bird was considered scarce by some of our best writers, and though since then it has become abundant, it is frequently, at least in sections of Michigan, so irregular in its movements and choice of summer haunts, that during some seasons it is quite a rarity. It is a peculiar species in its choice of a summer residence, and from its decidedly irregular migrations, we may expect it to become rare or abundant without apparent reason each summer.

My first acquaintance with it was in 1873, when it appeared May 9. The following season it appeared on the same date. These dates of arrival are a little later than the average, as they are usually here by May 5. My earliest arrival noted is April 25, and my latest May 12. The birds sing on their appearance or soon after, and continue the refrain until July 15, after which a sound rarely escapes them for some weeks, excepting the call notes, but again in late August I have frequently heard the simple song. The common song is: *Che che che che che wee wee wee wee,* sometimes *choo a choo a che che e wee o wee wee,* rapidly uttered. Another song, not so often heard, is difficult to express in syllables. It goes something like this: *Tsis tsis tsis tsis chee ah.* The first part of the song *tsis* is sometimes only repeated twice or thrice, again five or six times, the notes being nearly of one key, while the last part of the song is varied, the first syllable being higher than the end note.

It is essentially a bush warbler, confining itself to low trees and bushes, being seldom seen in the tops of trees. Specimens are taken from the tops of the tallest trees, but as a rule only during migration, as they usually remain in thickets and bramble patches. While nesting it is more commonly found among thick clumps of bushes, often near the edges of streams, but occasionally on high land, preferring the outskirts of the forest for its haunts. Most nests have come to my notice in low land among elm and ash woods in half cleared sections, where the raspberry and blackberry bushes have formed thick bramble patches. In favorable seasons a good many nests can be taken in an acre of briers, and I recall two years, when at least thirty nests were discovered. But the birds are quite scarce now, and few eggs have been taken since 1878 in parts of Michigan that I have visited. This season I have not seen a half dozen birds, but next year they may appear as abundant as formerly.

The nests are usually placed from three to four feet from the ground, sometimes a nest is taken all of six feet up, and many nests have come to my notice from a foot to two feet above the ground. These low nests were generally built on top of a recumbent raspberry bush. A common place for the nest is in a small-forked ash or elder. A few dates may give a fair idea of the time for nesting: 1874—June 1, two nests, four fresh eggs each; 1877—May 27, incubation began; June 8, young two days old; 1878—May 25, three eggs nearly hatched. The nests are quite durable in their make-up, and though one is occasionally taken which is rather loose in construction, most of them are quite firm in build. The body of the nest is composed quite often of coarse grass and small dead stalks, and is lined with finer qualities of the same. This description accords with Nuttall's, but more nests are composed of fine bark strippings and grasses, and are lined with hair—often horse hair. The eggs are three or four in number, more often three, but five eggs have been found in a nest. Roughly described, the eggs are small, white, and speckled with red and brown.

The chestnut-sided is a common species generally and well known. It was known to Sager in 1839, and is reported from all parts of the State, even to our most northern points. The birds depart for the south in numbers by September 15, and are all gone by the 25th of the month.

48. *Dendræca castanea* (Wils.) Baird. — Bay-breasted Warbler.

A rather irregular migrant. Often observed in abundance both in spring and autumn, and again scarcely observed or not seen again during a season. The earliest arrival I have noted is May 10, while some seasons no specimens are observed until the 20th of the month or even later. It does not remain with us more than a very few days in spring, and is frequently observed only during an afternoon's walk. The nesting season undoubtedly finds the birds in the extreme northern part of the State. No record of summer captures has appeared, and thus far it is not reported from the Upper Peninsula. Sager, 1839, embraces it, and most of the lists of Michigan birds mention it as a migrant and transient.

During the autumnal migrations the birds seem to be as a rule much more common than in spring, appearing in late August and remaining in favorable seasons until September 30. At this season they are silent but active. I have met with few if any of our warblers which are more active and pleasing in their manners than the baybreast. It is an active insect hunter, and in its movement often appears like a chickadee, rolling around the twigs and flitting about in a restless manner quite amusing. It has a most delightful song in the spring, which I have heard but a few times and unfortunately cannot describe. It is vivacious and pleasing, and quite different from the notes of the other warblers. Few notes escape the birds in the fall, and only subdued twitterings are heard.

49. *Dendræca striata* (Forst.) Baird.—Blackpoll warbler.

Strangely enough this species has never come under my observation, although many rarer members of the family are well represented in my cabinet. However, it cannot be called a common bird in sections in which I have collected. It is one of the last migrants to arrive and is frequently not seen till after May 20. It is pronounced a transient in the various lists of birds of the lower peninsula, but is recorded by Cabot, 1850, and Kneeland, 1856, of the upper peninsula, but is not given as a summer resident of them. Sager, 1839, does not embrace it. In its movements it is described as being similar to the baybreast, and like that species is irregular in its appearance and distribution during migrations. It is observed in the southern part of our State during late August and September.

50. *Dendræca blackburnia* (Gm.) Baird.—Blackburnian warbler.

An abundant migrant and known to all collectors in the lower peninsula, recorded by Cabot, 1850, in the northern peninsula. In the past month of June, during a trip among the islands and in various parts of the northern portion of our State, I looked in vain for the orange-throated warbler, although many species usually found in company with it during summer were abundant. This is one of those birds which has a reputation of going to the north to breed, but which I believe breeds abundantly in all suitable localities north of 43°, and frequently as far south as 42°. It is quite abundant in Southern Michigan during some springs, and again is really scarce, a peculiarity shared to a greater or less extent by many members of the family, and perhaps to be accounted for on the principle of a change in the migrating routes. I have yet to see a list, with the exception of Covert's, which embraces it as a summer resident, but the fact nevertheless exists that it is in many quarters really common during June and July, and the discovery of two nests is fair evidence of its nesting south of 43°.

The blackburnian warbler reaches us occasionally by April 24, being one of our earliest arrivals in this family. In late seasons it occasionally does not make its appearance until the 10th of May; but such late arrivals are unusual. The birds are generally common by May 5, and are observed flashing their brilliant throats among the budding trees from the early hours of morning to dusk. Tamaracks are favorite

trees of this bird, and they may be found with almost absolute certainty in the swamps during the first three weeks of May. Timbered lands are also favored locations, while shade trees in cities and the various fruit trees in orchard and garden are often chosen. The blackburnian is a lively bird, almost constantly on the move, and he must indeed be a poor collector who fails to secure one of these bright-colored birds in a day's tramp in spring. In 1878 I became satisfied that the birds nested in Kent and Ottawa counties, but sought in vain for the eggs. While noting the songs of our warblers in the spring of 1880 I became familiar with the pleasing song of this species, and was surprised at the number of birds I heard in the thick-foliaged trees in Montcalm county. A little later in the season, a number of females were observed carrying materials for nests, but none of these were found, owing to the density of the foliage.

In 1881, Benjamin F. Syke secured a nest in a tall and slender tamarack tree in a small swamp in Kalamazoo county. It was about forty feet from the ground, situated on a slender upward angling limb four feet from the trunk, and contained four eggs and an egg of the cowbird. Incubation had advanced to about the third day. The nest was quite dense in structure, composed externally of small tamarack twigs held firmly in form by milk weed (*Asclepias*) bark. Internally the principal material is horse hair, also fine roots and woody fibers in its lining, and it very much resembles inside, in form and appearance, the chipping sparrow's nest, but is somewhat deeper. Externally, however, it does not resemble any nest that I have met with. The following season in early June, the same collector secured a second nest in woods of the same nature, the structure being placed in a tamarack about thirty-five feet from the ground on a small crotching limb next the body of the tree. In make-up the nest was like the first, with the exception that it contained more roots in the base, and hardly any horse-hair lining. It contained three fresh eggs.

In addition to the several sylvicoline chirps and minor notes, this species has a song of considerable vivacity which is quite characteristic. The song may be described by the syllables *Cheah-cheah, deedle-deedle-deedle*, uttered in an energetic manner, and is very agreeable. The singer is often located with difficulty. I have never heard the song earlier than May 22 and do not think the birds are tuneful on their arrival, but only after the females arrive, which occurs some days after the appearance of the more gaudy males, and the mating is taking place. I have never heard the song in autumn and judge that, like most of the birds of the family, they are silent, with exception of the call notes. In Southern Michigan the blackburnian again becomes abundant in September, although a few appear late in August. They do not all leave us for the south until late September.

51. *Dendræca dominica albilora* Baird. — White-browed yellow-throated warbler.

Never common in localities in which I have collected, and it is not reported as abundant by any authority. Mr. Jerome B. Trombley, of Monroe county, in the extreme southeastern part of the State, writes me that the birds, although rare summer residents there, are still seen in such numbers that the habits may be observed. In his quarter it is one of the earliest arrivals of the warblers, occasionally appearing by April 20. Its favorite haunts are in the wooded bottom lands along the Raisin River, where they confine themselves to the tops of the huge sycamores which skirt the banks. The song is quite loud and spirited, and can be heard at a distance of three or four hundred yards. Some authors state that it resembles that of the indigo bird, and others that it may be likened to the black and white creepers. According to my experience the song is a very characteristic one, and bears no resemblance to anything I have ever heard. It may be expressed by the syllables *tee-o tee-o tee-o tow-tee*, accented on the syllable *tee*, and with a rising inflection on the final syllable *tee*. This song is repeated at intervals of ten or fifteen seconds, and kept up for an hour or more.

For several years in succession I searched long and diligently for a nest, scanning the tall treetops in vain. Finally I observed a bird alight on the trunk of a tree with building material in its mouth. In a few moments it flew to a partially formed nest near the extremity of a small horizontal limb in a tall sycamore not less than sixty feet from the ground, and at least twenty feet from the trunk. This discovery was made May 15, 1880. By the use of a field glass I watched the female at work on the nest which she completed and occupied. The birds depart for the south in late September, and by Oct. 10 all have disappeared.

I can add nothing to Mr. Trombley's remarks except to verify his description of the location of the nest. One nest came under my notice in late May which was built in a tall sycamore, which grew on the bank of the river, and it was situated on a small limb at some distance from the trunk. The inaccessible nest which I found was in 42° 20′ north and is the northernmost record in our State. My first specimen was shot May 10, 1877, and one was taken as late as Sept. 21, 1878. The whitebrow is not recorded by any of the older lists, and was first brought forward in a list, in my catalogue of 1879. It is fair to judge that its northern range is limited, and we may consider 43° or 44° as its boundary with us. Mr. W. H. Collins has taken it twice, spring and autumn, near Detroit. Contrary to its habit of keeping in the tops of tall trees and far from the habitation of man, a specimen was once brought me which was found fluttering about in a grocery store in the evening in September. It was a mature specimen.

52. *Dendræca virens* (Gmel.) Baird.—Black-throated green warbler.

A well-known, cheerful, abundant species. A transient in the extreme southern part of the Lower Peninsula, but a summer resident north of 42°, and abundant as we go further north. It is occasionally irreguiar in its appearance. In 1884 I did not see a specimen until after May 11, although one day, in what should have been the height of their migration, we walked ten miles in sections usually chosen by them. It is generally well distributed, however, and quite regular in movements. The earliest arrival noted by me in Southern Michigan is April 23, but one season they did not appear until May 4. The average arrival may be placed at April 29 or 30. The subject of this sketch has a preference for the tops of the trees while with us, and I think it is oftener shot by mistake by collectors mistaking it for some rarer species than any other member of the genus. It is small and on its appearance silent, and frequently excites the ornithologist's attention by its active movements in the treetops when it is shot in haste. It is rarely heard to sing before May 15, and usually at not so early a date, unless the season is an advanced one and the birds in their nesting haunts. It is not often musical during migrations, and only the late stragglers are heard in the fully-foliaged trees. It may prove that it remains during summer in the extreme southern part of our State, but such a record has not reached me, and as yet I have not observed it south of 43° during June or July. In Kent and Ottawa counties the birds often build, while in more northern parts it appears as a very common summer resident. On Mackinaw Island and in the northern peninsula I observed it as very abundant.

This species is omitted by only two of the State or sectional lists now before me, and is evidently one of our widely distributed warblers. The song is very pleasing, and though short and inclined to become monotonous in deep pineries or cedar swamps, when a great many birds are constantly heard, it is nevertheless agreeable in its intonation, and always listened to with feelings of pleasure. The notes may be described by the syllables *zooi-zooi, toodle-dee*, perhaps the syllable *zwee* would describe the first part of the song better, but as one accustoms his ear to certain sounds, the changes which he makes from time to time as he studies the notes become fewer, until finally the song is so firmly impressed on his memory that no other series of notes will appear as natural to him excepting those which he has formulated in his mind, and which appear as plainly before him on paper as if expressed by tongue.

But to return to the song of the black-throatod green, it starts in slowly, the first two syllables being of even key, then drops on the *too*, higher on *dle*, and running up to quite a high key on the last syllable. The song is oft repeated, and may be heard all day in the thick foliage of the forest without a bird being seen.

On its return journey its appearance is first noted during the last of August or early September, while the last birds to depart remain as late as October 5, in pleasant seasons. I have never heard them sing during the fall migrations, and only the peeping call notes are heard in the small flocks in the tops of the trees as they gaily sport among the partially bare limbs.

53. *Dendræca kirtlandi* Baird—Kirtland's warbler.

A rare irregular straggler in our southern counties. Out of the dozen specimens taken in America our State has represented herself by three birds taken during the last ten years. The only lists recording this bird are Covert's lists of the birds of the Lower Peninsula, 1878, and birds of Washtenaw county, 1881, my list of 1870, in which his observations were copied, and Stockwell's list, published in the FOREST AND STREAM several years ago. Mr. Covert secured two specimens in the town of Scio, one on May 15, 1875, and one May 16, 1879. These captures were duly recorded in the Nutall Ornithological Bulletin.

In the *Auk* of October, 1884, there is also a record of capture in Battle Creek, May 11, 1883 by N. Y. Green, Esq. This bird was incorrectly labeled *D. pinus* and sent East to a naturalist. There is reason to hope that this species will become commoner within the next few years as in the case of the Connecticut warbler and others with us.

SITTING GROUSE.

Editor Forest and Stream:

"Special," in his note to FOREST AND STREAM (issue of July 16) goes too hastily to a conclusion. I am altogether of the opinion of the editor—that the bird which "Special" thought the cock bird was in reality the hen which he had first seen. She had tried one means of diverting him from the spot where the chicks were concealed, and that failing, she tried another. Having found that tufts of grass were of no avail, she resorted to stones. It was my fortune this spring to disturb a ruffed grouse hen on her nest at the time when the young were just beginning to hatch. She did not attempt any "possum" tricks or pretend to have been injured. On the contrary, she spread her wings, raised her ruff, and attacked the stick which I had extended toward the nest with manifestations of the greatest rage, in the meantime emitting a hoarse, hissing sound, very much like the hiss of the domestic goose. There could be no possible question as to the sex of the bird. Last summer a hen quail (*Ortyx virginianus*) was sitting in one of my coops on a nest of eggs of her own laying. This bird, taken wild when full grown, was not especially tame; but if I placed my hand beside her while sitting she would pick and strike at it very much as an ordinary "setting" hen. If I pushed her from the nest, she would ruffle her feathers, lower her wings and come toward me, making preparations intimating that she was about to devour me on the spot.

Allow me one or two suggestions, which, while they pretend to advance nothing new, seem to be pertinent to this matter. At the close of the laying period the female bird (and particularly the females of the wild game birds whose nests are made on the ground, gradually passes into a peculiar condition which is indicated, as we say of common poultry, by a desire to "set." The incubating fever which develops within a day or two of the incubation is a manifestation of this condition, but it is not all there is of the condition itself. The fever is an effect, not a cause. But it indicates a temporary change in the mental actions of the bird which bears about the same relation to its normal status, as does the condition of a man who is fighting drunk with the same man in his usual condition of sobriety. Perhaps the illustration is a little extreme. But as already intimated, this condition seems especially marked in our game birds, and accounts for a great many manifestations which appear to be and really are at utter variance with the habits and character of the same bird at other times. The game birds are all faithful and persistent sitters and careful and devoted mothers, but their courage or tameness while incubating or with very young chicks, are transient, not permanent. Thus when even so good an authority as "Mignon" some months ago told us in FOREST AND STREAM about a hen grouse that was so unusually tame, he also explained the seeming phenomenon by saying that the bird was sitting, although apparently he did not take that fact into account at all.

It would seem to be a natural supposition that this condition indicated by the incubating fever reaches its culmination shortly after the chicks are hatched, and I venture the opinion that "Special," at the time of which he speaks, disturbed the mother of a very young family. JAY BEBE.

TOLEDO, O., July 22, 1885.

GRAY SQUIRRELS AND CHIPMUNKS.—About three years ago I put a few gray squirrels into a small grove of oak and pig nut trees. At that time there were a large number of ground squirrels or chipmunks. The gray squirrels have increased, and often come up to the house for nuts, but the ground squirrels gradually decreased and have now entirely disappeared. Have the gray driven out the ground squirrels, or have they deprived them of food and caused them to emigrate?—LONG ISLAND.

Game Bag and Gun.

A HUNT AROUND THE VINEYARDS.

THE deer of Southern California becomes in the autumn, when the leaves and twigs of the chapparal become too old and dry to suit its taste, a great marauder, ravaging gardens and orchards, and especially vineyards in a manner that is often quite serious. It is especially fond of the white muscat grapes of which the best raisins are made, and some of the most easy and pleasant hunting now to be had in America is sometimes found in the low hills surrounding a California vineyard. Where deer are but little disturbed with hunting they go but a little way back from the vineyard to spend the day, often lying down under some shady brush or rock within plain sight of it. Being well fed during the night, they have little feeding to do during the day, and consequently little roaming. Hence their movements are much more regular than when feeding at large in the hills upon the native vegetation; and when the hills are not too rough or brushy, the labor requtred to find a deer is often reduced to the lowest point possible in deer hunting, while the certainty of a shot rises to the highest point possible in that uncertain amusement.

No boy ever knows better when he is doing mischief than this deer does. Hence it visits the vineyard only at night, entering after dark and leaving with the first gray of dawn. Sometimes deer may be shot in the vineyard at night; but they are then so extremely watchful that they can hardly ever be approached unless with fire, as in regular fire-hunting, while lying in wait involves an amount of silence and frequent disappointments, that is far more annoying than a vain search in the hills by day. A more certain and pleasant plan for a good hunter is to take in the morning fresh tracks of their departure from the vineyard, and follow them back into the hills where they have gone to spend the day. This generally requires tracking upon bare ground, a thing difficult enough, but on the whole vastly more easy than it is represented by some writers, who would have us believe that the Indian alone can do it. But the strong probability of finding fresh tracks at once and overtaking the deer that made them if you can only follow them more than compensates for all difficulties.

One of the most pleasant hunts of this kind that I ever had was at the vineyard of Mr. Maxey, near Bear Valley, in the county of San Diego, California. It covers some twenty acres of bottom land in a little valley surrounded by low hills, forming a perfect amphitheater, of which nearly all parts are visible from the ranch house, a large adobe house of the olden-time standing on the rising ground by a spring upon one side of the valley, and well filled with comfort, hospitality and good cheer.

On a bright November morning my friend S. and I left the house after breakfast and went to the vineyard to begin our hunt. Everywhere upon the soft ground were abundant tracks of deer; tracks of every night for the past week mingled with many scarcely five hours old. Here a deer had sauntered down between two rows of vines without stopping, and there one had stopped and eaten half a dozen bunches of grapes before passing on. In the orchard below the vineyard havoc was visible upon all sides. Here, still hanging on the trees, were large, luscious Japanese persimmons from which a whole side had been taken at a single bite, and others lay scattered upon the ground in a still greater state of ruin. Oranges and lemons had been passed, apparently in disdain, but the late peaches, pears and apples had suffered, and the twigs of plums, apricots, and other deciduous trees had been freely nipped. Along the edge of both orchard and vineyard were hundreds of fresh footprints where the deer had come in and gone out, some having jumped the fence of barbed wire, others having crawled under it. One would suppose that at least fifty deer had been in during the night; but we had had enough experience before to cause us to reduce the calculation to a dozen at the most. Some had gone out, played around the adjacent slopes and returned again, and some had passed in and out several times, and all had made many more tracks than were at all necessary.

Starting at the western end of the orchard we made a circuit on the outside of that and the vineyard, so as to find the tracks that it should be most advisable to follow. Three deer, including a large buck, had gone out on the west, but they had gone into a cañon that was quite brushy. As the wind was from the east our chances of a near approach were so slender that we left that trail until afternoon, by which time the wind might have changed. On the south two had gone out. After following these a few hundred yards we found that they too had gone westward, and as it was quite certain some had gone out at the eastern end of the vineyard we left this trail also on account of the wind. At the eastern end we found that five had gone out—a doe, two large fawns, and two other deer having foot prints a trifle larger than those of the doe. These tracks were well mixed with those of each night for the past week; the ground was well covered with grass about an inch high that the first rains had started. The deer had played about here and there, making all manner of twists and turns. Altogether it was no easy matter to unravel the tangle of trails.

We finally followed the trail into the main valley that led from the hills upon that side to the vineyard. At the first branch of this valley the deer had a grand play spell. The fawns especially had jumped and pranced around in all directions, running up the slopes and coming down again with long jumps that tore up the soft ground in long furrows. Then the party had divided, the old doe going up the branch while the fawns went with the other two deer up the main valley. Some two hundred yards beyond this another branch turned southward. Into this the tracks went; and so to our surprise did the wind. Coming a little from the north of east this wind would be quite sure to follow this branch of the valley, so we had to retreat as hastily as possible in order to make a circuit and get out of the breeze, which would be sure to bear our scent to the deer and alarm them.

Retreating down the valley some two hundred yards we ascended the hill on the west side of the little valley into which the deer had gone, so as to be on the leeward side and also be where we could see into the valley. But before we had gone a quarter of a mile the brush became so high, dense and stiff that it was impossible to see anything over it, or get through it without making a noise that would alarm the deer before we could get near enough to them for anything like certainty in shooting. Nothing remained but to back out and go around to the head of the little valley and come

down it, and thus have the wind in our faces. Nearly half a mile away we could see where it ended by branching into several little ravines, with flat-topped ridges between clad with brush, the whole forming a little brushy basin just below where the rugged hills broke suddenly away into a smooth, grassy table-land beyond.

A detour of nearly a mile then brought us to a high rock on the edge of this tableland and there we sat down to take a look. Below us lay the basin well filled with dark green brush over waist high, among which was scattered a goodly assortment of boulders of gray granite. Carefully we scanned every bush and the shade of every rock, and turned a strong opera glass upon every little spot of gray, brown, black or white. Plenty of such spots there were; but one by one they changed under the glass into bits of shade, glimpses of granite through brush, or the skull of some long dead ox looking dimly gray through the fine bright leaves of the lilac or manzanita. The warm wind swept up out of the cañon into our faces, bearing with it the voices of the men gathering grapes far away below; but there was no sound of bounding hoofs upon the hard dry ground, no crack or crash of brush such as are often heard when the deer takes the alarm and starts from his shady bed. Far below, but scarcely three-quarters of a mile away, shone the white walls of the ranch house, with the broad vineyard lying in a dense mass of green before it, and beside it the ripening oranges were gleaming through the dark green foliage of the trees. Miles away and thousands of feet below us gleamed a broad silver band beneath the western blue, where the mighty ocean lay sleeping its long summer sleep of peace, while between lay a wild array of tumbling hills, rolling tablelands and valleys, dark with depth. On our right, on our left and behind us lofty mountains loomed through autumn's golden haze, some dark and soft with pine forests, others gray and rugged, being mere piles of boulders between which ragged chapparal and scrubby oaks struggled for existence. And all between, still bright with golden stubbles, lay broad, sweeping plains and tablelands, rolling skyward in long waves of rich soil covered with yellow grass or scattered live oaks.

On any of this our prospects seemed about as good as in the hills before us that lay around the vineyard. Yet it was certain that the deer had entered this little valley whose branching head lay just before and below us. It was certain that they had not passed out on the side on which we had made our detour or we should have seen their tracks. Nor was it probable that they crossed over into the head of the next valley beyond, for had they intended to go into that one they would have been more apt to enter it by its mouth. That we had neither heard nor seen anything of the game proved nothing, for deer that live much in brush have a habit of hiding or skulking in it and may lie still or even stand still within fifty yards of a person or sneak quietly off without one's suspicion of their presence. It was quite probable that they were not two hundred yards from us, lying down on the shady side of some little ravine or under some large bush.

About one hundred yards below us lay a noble boulder of granite with a smaller one beside it by which we could climb upon it. Its top was broad and flat and formed a most tempting place to sit and enjoy the view and the breeze if nothing else. It was hardly necessary for me to suggest that we should transfer ourselves to that boulder, for my friend had already chosen it as his next resting place.

"Now," said I, as we stretched out upon it, "let's make quite a stay here. A deer even when hiding from you often gets uneasy after a while and cannot resist the temptation to have a good look at you. If you sit long enough within view of one, you may finally hear the brush crack, or may see the tips of a pair of ears arise out of the brush somewhere, or a pair of horns perhaps come surging"——

"That isn't a pair of horns over there, is it?" he interrupted, pointing away on the left.

About one hundred and thirty yards upon the left two points some three inches long and twelve inches apart were just visible above the chapparal. To an untrained eye they might have passed for the ends of dead sticks often seen in such brush, whose weather-beaten ends often look gray and shiny. But there was a peculiar hue and glitter about these points that made them like the face of an old friend dimly caught amid a crowd, while their distance apart and direction left no room for doubt.

My rifle was sighted for that very distance, and was a very accurate one, whereas I knew that S. had not tried his for a long time, and did not know exactly for what point the sights were set. I handed him mine and told him to fire about a foot below the center between the lower ends of the two points.

"No," said he, "you try them."

There was no time for parley or further interchange of courtesies. At any second the points might disappear, to be seen no more that day. Moreover, it was a difficult shot involving too much guess work as to the precise point to strike, and a head being too small a mark for that distance even if distinctly seen. But firing by guess at the supposed body would have been still worse, as it was impossible to say which way it was standing.

Drawing a fine sight a foot or so below the center between the points I fired. What a whirl of gray and white above that distant brush followed the report of the rifle, as the deer sprang upward and turned around with almost a single motion. Up he came again in a shining curve of gray, his whole outline forming the top of an arch over the brush. Bang went my companion's rifle and bang went mine, aimed about where I thought the glossy hair would descend into the brush. The smoke for a moment rolled across our line of view, then in an instant was swept aside by the breeze, and there just about the place where our deer had disappeared stood a statue of beamy gray. Now we could see it plainly, for it stood upon a knoll, perfect in outline with head proudly erect, long, tapering nose and great flaring ears pointed directly at us The bright morning sun shone from its dark iron gray back and glittered on three or four points upon each horn, a perfect picture of a three-year-old buck.

Both rifles rang out almost together, through the smoke we dimly saw another whirl of white and gray; but before either of us could fire again it was gone, glimmering through the dream of things that ought to be. But in a second more there rose from the brush in a little ravine beyond just such another pair of horns with just such another curve of beamy gray behind them. Again our repeaters poured dire intentions upon the scene, but in a moment the gray was once more gone, fading over a ridge amid a maze of brush.

But there was no time to think or indulge in speculations or regrets. For scarcely had the brush closed over the slippery beauty before a crash of brush about a hundred yards ahead of us made us turn about with something akin to haste. There, surging through the chapparral upon a slope across a deep ravine, were the two fawns. They looked nearly as large as the bucks, as with the gay bound of the mule deer they rose high above the brush from the impulse of their springy legs, striking ground with all four feet at once, and bouncing from earth again as though it was an India rubber cushion. Now with a long jump to one side, then with a short jump to the other side, rising ever high in air with all four feet grouped beneath them ready to beat the ground simultaneously with a heavy thump as they descended, the fawns sped swiftly away. Ball after ball tore up the dirt around, above and below, and hissed and sang through the air beyond, until they suddenly wheeled and plunged into a little ravine filled with brush. Just ahead of them a big wildcat was running, evidently under the impression that he had fallen on dangerous times. As he reached the top of the slope he yielded to the temptation to stop and see what was the cause of the uproar, evidently having been started by the noise only. He sat upon his haunches with brindle back turned toward us and turned his gray face backward over his shoulder. In a second more the cat and the dry dirt beneath it flew about two feet in air as a heavy ball from my friend's rifle struck the ground by the root of its stubbed tail. It went over the ridge in a sommersault of brindle hair and we were again alone.

Plenty of noise and smoke we had made. In fact, few rocks have ever seen such a cannonade in such a short space of time. Yet nothing had fallen and there was a painful dearth of evidence that anything had been hit. Taking first the track of the fawns we found them leading away in long jumps, tearing up the ground with every leg intact. It seemed almost useless to go to look for the others. But we went more from sound principle than from hope. Within ten yards of where we had fired at the first deer lay a three-year-old buck dead, shot through the shoulder. And now the question arose, had we been shooting at only one during the first part of the programme or had there been two deer? A little circling around revealed a track leading away in full run, and following it about a hundred yards we found another three-year-old dead with two bullets in him. The second had evidently risen almost into the place first vacated by the first one, and the first was the last one we found.

T. S. VAN DYKE.

TWO NIGHTS ON THE DUG-WAY.

NEAR the point where the waters of Grand Lake debouche into the Biver St. John, the latter describes a reversed curve, something the shape of the letter S. This is called "No man's friend," because vessels have to beat at some point in it no matter which way they are going or in what direction the wind. At the lower part of the curve, just where it reverses, a narrow intervale bank separates the river from Foshay's Lake, a lagoon, joined to the river by a narrow mouth about three miles further down. Here, when the water rises about four feet, the river makes a "cut off" at a low place in the bank, part of its waters rushing into the lake with great velocity. This passage is known as the Dug-way. Between this and the mouth of Foshay's Lake, forming a sort of island when the water is up, are hundreds of acres of bottom lands comprising nearly everything from the broad, level meadow, cutting three tons of hay to the acre, to the apparently bottomless slough and impenetrable thicket. Only two families live on this tract of land, and during the freshet season they are, to quote the words of a local Solon Briggs, "like John the Baptist on the island Juan Fernandez." A large part of this tract belongs to the Scovil estate, and a "muchly wanted" man who made a big figure on Wall street for a time and whose name is still green in the memory of New Yorkers, was one of the heirs. The grass on this was formerly rented to neighboring farmers, and my father, who lives eight miles away, once leased the Dug-way block for four years. Here is where I got my first taste of camp life.

Never will I forget the little lean-to "wick-y-up" in the big grove of elm, willow and maple, the bracing effect of the cool September air, the delicious taste of the meals we ate there, and most of all, the shooting in the early evening, as ducks flew back and forth from the lake, for as a "fly-way" the Dug-way was then, as now, unequaled by any place I know of in this province. And we do not have to look far for a reason. On the opposite side of the river, here about half a mile wide, is another tract of land similar to that just described; and this low open pass is a natural highway from the one to the other. In the early spring hundreds of geese harbor here for nearly a month, and during a heavy south wind the bank of the Dug-way is a sure place for a shot sometime between 4 and 11 P. M.; yet the small number of casualties in the great goose army is truly surprising. It was for the purpose of increasing the mortuary list, in some of their brigades or platoons, that Sam and I were ensconced in a blind, behind a huge drift log, on the evening of April 20. (Now, don't, I beg of you, brother sportsmen, come down on us like a ton of brick for spring shooting, we don't kill many, and the geese don't visit us in the fall.) To the south of us was the lake, and out in the middle were a few geese. A crescent of trees, concave side toward us, started at the river bank, nearly a half mile below, and terminated in Long Point in the middle of the lake. On either side of a break in this line, about eighty yards wide, was a blind. On the lake shore, less than 200 yards away, was a clump of red willows, on the top of which a wisp of hay appeared to have accidentally caught; but beneath, the sharp eye could detect a boy, small in size, but prodigious in the amount of mischief he was capable of doing if geese came in range.

By the stone abutments of a fence out on the marsh two more blinds were built, while near the lake but far from any cover was another man concealed in a small hay-blind. The air was perfectly calm. The sun was close to the horizon when the first flock came in sight a mile away, now coming directly toward us, now swerving as if they would pass far out of gunshot. They came provokingly near, and then passed right over that little wisp of hay on the willows. Davie's first barrel missed fire, which so disconcerted him that they were out of range before he got in his second. All quiet for half an hour. Suddenly the few on the ice rose, swinging round, passed close to the eastern side of the break or "lead" before mentioned, on Long Point. There were two diminutive puffs of smoke, like a double whiff from a ten cent cigar, and two of the flock were placed to the credit of Pilkington's 16-bore, Lamont's 12 on the opposite side failing to call any down. To some this would be convincing proof of the superiority of a 16 over a 12 for goose shooting, but it only proves that a 16 when geese are in range is more deadly than a 12 when they are not. Another fact that many seem to forget is that a ball from a .22 pistol when it hits, is more effective than one from a mountain howitzer when it misses.

A hum of voices caused us to look eastward, and the procession that was making its way down the intervale, would have justified us in the assumption that the Mahdi had invaded our little province, or that reinforcements were on their way west to join Riel; but it was only the army of shooters for the evening flight. They were armed with every conceivable pattern of lead projector, or to quote one of our rural poets, who described the weapons at a local shooting match, there were:

> "The Remington so neat and trim,
> The needle gun, so long and slim,
> And the musket that killed with a poisoned dart,
> The golden eagle of Bonaparte."

All these, or their prototypes, were there; the counterpart of the last-named being in custody of a youth whom we will call Johnny, who was out on his first hunt. The weapon is well worthy of a description. An old converted musket of the pattern that assisted the great Marlborough to win Blenheim; the barrel large enough to admit a "poisoned dart," if the shaft were any smaller than a pitchfork handle; the comb of the butt rasped away to make a rest for the cheek in aiming, and a ramrod too light for a crowbar, but too heavy for the purpose for which it was used. Yet the pride and happiness depicted on the boy's countenance might justly be the envy of the middle-aged sportsman armed with the best production of London or Birmingham art.

In a few minutes the throng had disappeared behind log, stump, coulee, brush, or any convenient cover, and the country changed its aspect almost as suddenly as did the hillside at the wave of Roderick Dhu's hand. And now we espied a single figure making the best possible time down the ridge, and we observed that it carried no gun and bore a strong resemblance to the "Commodore," a brother of Johnny. When we heard him hail Davie to learn his brother's whereabouts, we knew that Nemesis was on the poor boy's track. Shortly afterward we heard the following colloquy:

"John! bring here that gun." "I won't." "Bring it here, I tell you, or I'll come over there and give you a good kicking." The domestic cowhide argument was too much for the boy, and he approached his tyrannical elder. Slowly and sadly, as he would lower a coffin into a grave, he surrendered the canned earthquake, likewise the bottle of powder and handful of loose buckshot, that he had slipped into his pocket, also the box of "beaver-hat" caps. As the newly-armed cruiser turned away, he said: "After this you leave the gun alone." This was too much. "I'll let you know I'm going to gun a little as well as the rest of you," was the reply. I was truly sorry for the boy, and felt like anything but joining in the derisive "whoo h-o-o" with which some of the shooters greeted the last remark, though had he left off the little blank blank with which he emphasized it, he would have borne away a larger share of our sympathy. One compassionate boy called him over to his stand and told him that "he should have a whang at 'em, if they came." That boy will make a sportsman, if he live, but "the good die young."

Night closed around us, the moon being half down in the west, and of the shape, the representation of which the infidel Saracen chooses to adorn his banner. The stillness was only broken by the almost constant whistle of black ducks' wings. In an hour three flashes at the "lead," showing against the dull sky as if some one had made three ineffectual attempts to strike a match against it, three dull reports soon after told us that something was on the wing. A double flash from the hay blind showed that it was coming on. Then there was a series of flashes from every abutment of the stone fence, followed by a sheet of fire from stump, bush, tree and log on the outside ridge, and winding up with a grand eruption from the Commodore's volcano. Looking westward, high up in the "daylight streak," we saw two geese, which had run the gauntlet of that fire without the loss of a feather. We were soon certain that there would be no regular evening flight, so we lay back against the log and "took it easy." By and by I became sensible of a labored wick! wick! mingling with the sharper whistle of ducks' wings, and looking up we saw eight geese that had flown directly over our blind fading away in the darkness. "We've let the shot of the evening slip through our fingers," said Sam, "let's go home."

A few nights after this, Sam and I again embarked for the Dug-way. Sam'l rather likes to hunt with me, for I usually give him his own way, and I have a good canoe. We would be an able team on the single blades, too, but he will only paddle with his left hand next the blade, whereas in this one respect I am ambidextrous. As we had to go dead in the teeth of a heavy south wind and I was "bow paddle," I had no easy task to keep our craft in hand. Our paddle ended, we found the geese sitting in great rafts close to their feeding grounds, which meant that we were late. Sam said they must be driven out. Accordingly I took the rifle and a package of cartridges, he accompanying me with a shotgun, and we gained a point on the shore about 300 yards from the nearest flock.

The person who never tried may consider it no feat at all to kill two or three of those geese with a rifle; but when he sees how near it is possible to come to a goose and not hit; how faint a hairbreadth's difference in the elevation will cause him to shoot over or short of it; what a forest of necks a bullet can pass through without touching one, and what a tough thing a goose is anyway, he will wonder that one is ever bagged in that way at all. I have made a careful calculation, and I find that killing shots, with me, average about one in fifty (I am not joking), and hits about one in fifteen; yet I can on a still day, at 150 yards, send ball after ball into a tree six inches in diameter.

On this occasion the first bullet, dead against the wind, dropped short, the second splashed up the water right among them, the third raised such a commotion on the edge of the ice that they did not consider themselves safe until they had put a mile between themselves and us. Each time I fired the flock would rise and drop a little further away. Sam selected a site for a blind, and we were on our way back to the canoe, he being about 100 yards ahead, when we espied the geese coming, laboring heavily against the wind. He took a willow tree, I lay on my back, but as they put a hay barn in their line of flight, he ran about eighty yards and gained the barn easily. As they came over him he doubled up the rearmost, but catching his wings he sailed out over the lake, the other two crooking their necks and settling, as he settled, till he went down, when they alighted by his side. I tried one of them with the rifle and knocked out a few feathers, but he never winced. We shouldered the

canoe and carried it the hundred yards that separated the river from the lake. I could write quite a chapter on the cussedness of wounded wildfowl (or perhaps I should say "the instinct of self-preservation"), but for diving, staying under, skulking, and all the tricks practiced by them, I would unhesitatingly award the goose the palm. We got between this fellow and the ice and let him worry for a while. He would sometimes stay under two minutes, but at last he appeared within sixty feet of the boat. A charge of SSSG from me and a dose of BB from Sam brought him to bag, but he lived fifteen minutes after that, and then only succumbed to treatment that the strongest constitutioned goose would fail to withstand. When I fired, the recoil unlocked the breech of the gun, and the brass shell slid out and dropped in the canoe; no harm done, but not "unco pleasant." Greener's patent ejector will please take a back seat. This incident had its effect on the shooting later in the evening, though I "turned off" the ejector by wedging a piece of wood between the locking trigger and its guard.

On a little tongue of land at the mouth of the Dug-way, we turned over our boat and built a blind on the lee side after covering it with hay. The wind was still blowing a gale, but the night was beautifully clear. The moon was in that phase which the schoolmaster taught us to name "gibbous," though I must admit I have never seen the word in print since; and gladly seize on my first opportunity to "get it off." We sat in the blind up to 11 P. M., and did not see a goose. But the hours were not dull or monotonous. Black ducks whizzed through the air incessantly, and we saw one woodcock and quite a number of snipe. Just dark, two wood ducks (so Sam said) went skimming around, like magnified bats, close to our blind. They kept up their little game of pitch, dash, dive and dart, for about half an hour. A pair of field mice got into the hay of our blind and shared our vigil. The wind manufactured a sort of Æolian harp out of the ends of bank grass that hung down between the stem and stern of the canoe and the ground, for the bilge was all the part that touched, add to this the musical *coo-hank-honk* of from 600 to 800 geese about a mile away, and any sportsman will readily see that we were not lonesome. Sam was smoking, I was dreamily contemplating the lights of Gagetown which some facetious American said was "the only finished city he ever saw," when a single sharp, clear *honk* sounded about 200 yards to windward, and we were on our knees in a trice. Already I could see the dark line of the oncoming flock, about twenty in number. Sam made frantic efforts to get the cover off the locks of his 14-bore muzzleloader, but they were on us before he was ready. I caught the leader, followed his flight for a second, and gave it to him, but though we heard the shot "spat" on his feathers he did not even change his course. They passed over a blind occupied by the only shooters except us that were on the Dug-way that night, and got a salute from an 8-bore and a 14, but none fell. The boys went home.

For two hours the air was full of geese, the number in the flocks ranging from three to a dozen. Sam took the leader of the second bunch and I the rearmost. Mine pitched into the lake, his went down the Dug-way, but we got neither. In less than a minute three came down the wind like an express train, and having a shell in, I covered the foremost and he dropped like a stone. To shorten the story, out of six geese downed from that blind, we took home one. We stayed till morning, hoping to recover some of the wounded, but were not successful.

After the moon went down the air grew more chilly, and to add to our discomfort the water was rising rapidly and threatened to soak through the hay in the bottom of the blind. A lunch of goose breast sandwich helped to make the position more tolerable. Sam hoped that, if we kept still the geese would settle near enough to give us a shot at daylight. I could not move without being saluted with "Keep still, can't you? Don't you know they can see the least motion 100 yards off, no matter how dark it is?" I didn't know anything of the kind, and have not learned it yet. About every ten minutes he would draw out a match and light his pipe, making a series of flash lights that could be seen half a mile off, but a goose couldn't see that, oh no. The rear of the blind was so open that our heads were above it all the time, yet dawn revealed a flock on that side within eighty yards of us.

They came closer at first, but as they commenced to feed away again, my companion grew uneasy. "They are out of shotgun range, give 'em a careful shot from the rifle and you'll get one." "How can I deliver a careful shot when I'm shivering so that the hobnails are dropping out of my boot soles?" "O! well,then, we'll give 'em a salute with the shotguns." We fired the salute, and every goose acknowledged it by many graceful waves of its wings.

Thus ended a hunt that I enjoyed thoroughly, though the pleasure was somewhat marred by the number of cripples we made, for I like to kill cleanly or not at all. I never got hold of a gun that had too much "shake." I want the shot and "plenty of them" at that, to go where I am, and if the aim is incorrect, I am ready to abide by the consequence. I don't want a "comprehensive" weapon. Therefore, for geese, large shot, such as I used the evening in question, in a medium-bore gun, is a delusion. The occasional kills made at long range will not make up for the vexatious misses at short. BB is about the right thing, then, if you wound mortally, pellets enough will strike the game to bring it down at once, while with buckshot and kindred sizes you can only hope for two or three to strike, and they may not touch any vital part. L. I. FLOWER.

ADIRONDACK DEER.

Editor Forest and Stream:

I have spent some time during the past thirty days in Potter and McKean counties, Pa., and have talked with hunters, hotel men, and land surveyors about the increase of deer in those counties since hounding has been prohibited by law. All agree that it has proved a wise and humane act and that the deer have increased rapidly. One gentleman, a land agent for the Keating lands, who has been through the wild lands camping and surveying weeks at a time each summer and fall, the past twenty-two years, told me that the deer were as abundant in some places now as they were twenty years ago, and much more so than they were eight years ago. This gentleman speaks of what he has seen and from an unbiased standpoint, as he neither uses rod nor gun.

Some persons will keep flinging out wrong ideas about the hounding act passed at Albany last winter, but I am fully satisfied its benefits will be admitted by nearly all who have a chance to know inside five years. Still-hunting will be savagely attacked by those who wish to run deer with hounds and kill them in the water. It holds true that not near as many will be killed by the former as used to be by the latter method. If a guide loses a few days' work which he formerly had in hounding he can more than make it up in November, if he is a good still-hunter, as four or five deer will make up for the time formerly used in killing many more than that number. Why? One reason as follows: The larger portion of driven deer are unfit for market, especially if September and October are warm, while still-hunted venison, if killed in November, is good and brings the best price.

For sportsmen who wish a deer or two for their own use there is only one way, and that is still-hunting. P.

WELLSVILLE, N. Y.

BEAR DOGS.

Editor Forest and Stream:

The article on bear dogs tempts me to say something on the subject. When I was a lad not yet in my teens I was sent to live with my grandparents in a far-back settlement in Vermont, where bears were very plenty. Grandfather was a "mighty hunter" and had several sons, chips of the old block. They owned a small black cur, of less than twenty pounds' weight, that took to hunting bears of its own accord, and treed several before he was a year old. Cutting logs for the sawmill that grandfaither owned kept the boys most of the time in the woods, where the dog always followed. On getting scent of a bear Hero would follow it up noiselessly till within biting distance; then came a torrent of sound more like screeching than barking, a sound he gave forth only when near a bear, at the same time getting in his work nipping the bear's heels as often as possible and jumping one side to avoid the bear's paw. The bear thus worried would soon tree, and the dog's tune would change. All this was well understood by the boys, and as soon as Hero's bark was heard they started with the old flint-lock Kentucky rifle, and bruin soon came tumbling down. As soon as large enough to hold a gun I was allowed to take a turn shooting, and many a bear I "potted." The dog never got a scratch, and died of old age with forty-two bears to his credit. This was the only good bear dog I ever saw, and, like Topsy, he "growed so." Such a dog to-day would be worth the price of a small farm, and I would be willing to pay it for one. BRANDON.

Editor Forest and Stream:

I remember once, with a little enthusiasm, of saying in a private letter, which you clipped, something like this, that "I never knew an ardent sportsman that was not brave in war and a gentle, kind man in peace and at home." Let a man love the creatures below us, and he finds a never-failing source of happiness and much more to live for. "Pious Jeems" could come among the old "bar hunters" of our mountains, whose professions are now gone, and with his good-natured eloquence make tears to be shed equal to a camp-meeting. I have been told that some of our latest bear hunters here used with success cross on the shepherd and foxhound. I can remember the savage dogs of old hunters, perhaps cross on the bull and hound. The dogs that answered to Pious's terriers were cross on the courageous little fice and cur. Dogs are like men, little and big; some will fight and some won't; and I have always heard it related that the beardog came from no particular race or stock. GRAEME.

SOUTHWEST VIRGINIA.

ILLINOIS GAME WARDEN LAW.

FOLLOWING is the text of the law enacted by the Legislature of Illinois providing game wardens:

SECTION 1. Be it enacted by the People of the State of Illinois represented in the General Assembly, That the Governor of the State shall appoint three game wardens, one from each of the three largest cities in the State, whose term of office shall be for two years from the time of taking effect of this act or until their successor or successors are appointed; said game wardens shall receive no salary from the State for their services, but shall receive a portion of the fines and proceeds of sale as hereinafter provided.

SEC. 2. It shall be the duty of such game wardens to prosecute persons and corporations having in their possession game, deer, wildfowl and birds contrary to law, as hereinafter provided, and also to enforce the game laws of this State.

SEC. 3. If said game wardens or either of them has reason to believe or does believe, that any person or corporation has in his or their possession, contrary to law, any game, deer, wildfowl, or bird, it shall be the duty of such game wardens to go before any justice of the peace in the county and make affidavit of that fact; said justice shall thereupon issue a search warrant against the person or corporation so complained of, directed to any constable of the county, commanding him to proceed at once and search for said game, deer, wildfowl or bird, and upon finding the same, to seize and take possession of the same and keep it until further ordered by the justice; said constable shall also read said warrant to the owner or person in whose possession said game, deer, wildfowl or bird is found.

Said warrant shall be substantially as follows:

STATE OF ILLINOIS, } ss.:
.....County, }

To any Constable of said county: You are hereby commanded to search (here describe place), and seize and take possession of, and hold, any game, deer, wildfowl or bird found there; and you (here name owner, or person, or corporation in whose possession game is found), are hereby notified to appear before me, at my office, in (here locate office), on (here state time of trial), and show cause why the game, deer, wildfowls or birds should not be sold, and the proceeds thereof distributed as required by law.

(Date of warrant). (Signature of Justice),
Justice of the Peace.

Which said warrant should be returned within not less than twelve, nor more than twenty-four hours from the date thereof.

SEC. 4. At the time mentioned in said warrant, said justice shall proceed to hear and determine whether said game, deer, wildfowl, or bird, was in the possession of the person or corporation, contrary to law, and if said justice finds that said game, deer, wildfowl, or bird was in the possession of the defendant contrary to law, then said justice shall enter judgment against the defendant, and order a sale of the game, deer, wildfowl or bird seized; but if said justice shall find that the possession of said deer, wildfowl or bird, was not contrary to law, then the judgment of the court shall be that the same be returned to the person or corporation from whom the same was taken.

SEC. 5. In case of a judgment and order of sale as specified in section four, then said constable shall at once post two notices, one at the justice's office and one at the place of sale, specifying in each notice the time and place of sale, not less than five hours from the date of judgment, also a description of the game, deer, or wildfowl to be sold; said place of sale shall be upon the principal produce street or market of the city; said constable shall at the time and place mentioned in said notices sell said game, deer, wildfowl, or bird at public auction to the highest bidder for cash, and at once pay the proceeds of such sale into the justice's court; said constable shall give to the purchaser a certificate of purchase, in which shall be a particular description of the game sold, together with date of sale.

SEC. 6. Said justice shall, as soon as the proceeds of sale are paid into his court, deduct the amount of his costs, together with the constable's costs, and distribute the balance as follows: One-half shall be paid to the game warden, which shall be kept by him for his services, and one-half paid into the county treasury for the benefit of the school fund.

SEC. 6. Said game wardens shall each make an annual report to the Governor, showing the number and kind of game, deer, wildfowl and birds seized and what disposition was made of them, and the amount of the proceeds of the sales.

SEC. 8. Game wardens shall not be liable for any damage or costs sustained by any person or corporation by reason of the wrongful seizure of game, deer, wildfowl or birds under this act: Provided, however, that the enforcement of this act shall in no wise prevent prosecutions of persons or corporations for violations of the game laws of this State.

"STAUNCH ON POINT."—Augusta, Ga.—Now for an oddity. I was talking to my friend Dr. H., of this place, a few days ago, about the queer positions dogs take in pointing, and he said last fall his pointer was running very fast down wind, when he ran square into a covey of birds, flushing four of them before he got the scent at all. The whir of their wings attracted his attention at once, and he stopped so suddenly as to fall down. In this position, with his feet up in the air, lying on his back with his head turned to one side and fearing to change his position, he actually remained for five minutes, pointing the birds until the Doctor flushed and shot at them. As the Doctor is a strictly truthful man, and besides had no reason to "tell a bigger yarn" than I could, I believed him, but have you ever heard of such a thing being done before?—OLD H.

MOVEMENTS OF BAY BIRDS.—Philadelphia.—The first coming bay birds are just beginning to show themselves on the New Jersey coast. The flights are not large; only stragglers have appeared. Look out for big flights after the next change in the weather; a storm will bring them. Some grass plovers are this week passing over Philadelphia at night. It is a little early for them, but by the 1st of August we shall hear many more.—HOMO.

"IN CAHOOT"—An expressive slang phrase in use by all classes here as an opprobrious epithet; meaning a concerted partnership or conspiracy to do some illegal act, or, at least, one that is not open or fair. Worcester puts it too narrow and a little too strong (for us) when he says, "Particularly a party of men engaged in a predatory excursion." "Cahoots" not used.—GRAEME (Southwest Virginia).

JAMES CUMMINGS DROWNED.—Utica, July 26.—James Cummings, age sixty, a well-known Adirondack guide, was drowned in Jack's Lake Saturday evening while swimming after a drifting boat.

NEW JERSEY WOODCOCK.—Brick Church, N. J., July 27.—Woodcock have been very scarce here this season, the greatest number bagged by one man being five.—G. D. L.

Camp Fire Flickerings.

"That reminds me."

157.

FOUR miles east of Connecticut Lake, Magalloways Mountain rises above its waters 1,000 feet. A few years ago, on its slope roamed one of the largest specimens of the moose family. The old fellow had escaped from the crust hunters for many years, and the Deacon and friends resolved to try him once. Old Bose, an experienced moose dog, the Deacon's property, must go, no yelping curs would be equal to the task, when once the bull was out of his yard, en route for some more secluded resort. Many weary miles of lake and forest before the first floats were found. I need not describe the exciting chase. Bose did his work in a style approved by those who are fond of dog-chewed venison, and the bull was compelled to halt and prepare a "bed" to drive away his tormentor. Bose sat down to wait for the Deacon, as usual. But his blood was up. He had tasted blood, and hardly restrained his anxiety for the coming hunters. The bull was now prepared to meet him, and the tempting nose was not long to be resisted. Bose, just to show off, did take hold. "Land sakes," said the Deacon, "you'd orter see him fly." The nose passed him to the fore, and that to the hind foot, and with ribs crushed and nearly lifeless Bose lay on the crust fifteen feet away. There was no delay on the Deacon's part to avenge the death of him who had shared his dinners and blanket in many a moose hunt. After the hide was removed from the moose and supper, eaten from the sirloin, the boys were "hugging the muskeeter smudge" as the Deacon remarked, for the night was bitter cold. The Deacon prepared for bed and first encased himself in blanket, then rolled the moose hide around him, several feet away from the others. Daylight and breakfast came, but all was quiet in the moose hide, save for an occasional grunt. A call did not arouse the object under the fir tree, and a vigorous tug at the unwieldly mass awakened the boys to the fact that the "muskeeter smudge" must aid them if they wished to see the Deacon. The object was drawn up to the fire and the Deacon was slowly thawed out to take another look at the remains of Old Bose.

NED NORTON.

158.

Reading the experiences in the columns of your valuable paper lately on battery and sinkbox shooting reminds me of what my friend, a thorough sportsman, told me happened to him a few years ago. On a certain Friday early in the

spring, in company with two others, he started for a famous marsh in Northern Illinois for a few days' sport. As is usually the case, the spring rains had filled it full and much of the cover used in the fall was under water. Not being able to find boats for all, my friend accepted the use of a large barrel which a gentleman had sunk the fall before for his stand. My friend was filled with joy as he thought of the advantage he would have over his chums for one day at least, and before going to bed Saturday night had counted his bag for the next day. Early in the morning he started for the barrel, being rowed out to it by a friend, who then left, saying he would stop for him in the evening. He had scarcely begun his slaughter of the unsuspecting ducks before the wind, blowing from the south, freshened into a gale, and he found the water was backing up. Soon the waves rose high enough to wash in the barrel, and instead of knocking down the ducks he must bail out the water. The more he bailed the higher rose the waves. Finally he was compelled to roost on top of the barrel. It was at this time his melodious voice might have been heard over the roar of the waves, but all in vain, the friend "had left for pastures new." After deliberating a while, he concluded that discretion was the better part of valor. Removing his cartridge belt and holding it and his gun high in the air, he took "a header" and slid off his roost into the marsh, bound for the shanty a mile away. As he arose, blowing the water out of his mouth, he vowed never to shoot from a barrel again.

LARGE-MOUTH AND SMALL-MOUTH.

Editor Forest and Stream:

It was with great pleasure that I read a defense of the large-mouth black bass by the "philosopher of the Bigosh," in a recent number of the FOREST AND STREAM, in which the palm is awarded to the large-mouth, on account of its rising so much more freely to the fly than the small-mouth. This is exactly my experience, and the mere fact of one fish taking the fly better than another settles at once, without an instant's doubt, which is the best fish in the mind of a fly-fisherman.

For many years it has been the fashion among many anglers to decry and run down the large-mouth and extol the small-mouth. I have noticed that many of these writers fish in New York and Ohio, in Lakes Champlain and Erie. The cat is let out of the bag when one comes to examine their way of angling. They either troll or still-fish or perhaps cast the minnow, and more often than not they fish from a boat. Now if there is one axiom in angling it is the superiority of fly-fishing (casting the fly, not trolling with flies) over any kind of bait-fishing. Brothers of the bait and trolling rods, there is no use of your protesting, any one who is unprejudiced and can use the fly-rod never will take up bait-fishing or trolling with the spoon when he can avoid it. There is no comparison between the two kinds of fishing. Again, any way of fishing that requires the help of a man (be he boatman, guide or any one else) besides the angler himself is not such high sport as where the angler has to depend on himself alone, on his own skill, and on his knowledge of the game he is after. Therefore trolling out of a boat with a man to row, as is practiced on Lake Erie and other places for small-mouth black bass, is inferior to casting the fly from the bank for large-mouths.

Often you will read attacks on fly-fishermen, hints that so and so will make a great pretense of fly-fishing, but when out of sight will use the fin of a trout or a worm on his fly-hook. Any man who will condescend to such practices should be drummed out of the ranks of fly-fishermen. I have been an angler for many years, and I can truthfully say that I have never stooped so low as to use anything but the fly, pure and simple, when fly-fishing. I would consider it dishonorable and a disgrace to my rod to put a worm on when trout fishing. I heard a good sportsman say the other day that the difference between fly-fishing and bait-fishing was the same as shooting a partridge flying and potting a covey on the ground. This may be far-fetched, but there is a good deal of truth in it. But enough of this long digression.

My experience has been the same as the author of the Bigosh papers with the small-mouth and large-mouth. I have caught the large-mouth black bass from the southern part of Louisiana, through most of the Gulf States, and northward, and I have always found that they not only rise splendidly to the fly, but that I have caught as big ones as by bait-fishing. On the other hand, the small-mouth does not take the fly freely (remember I am speaking of legitimate fly-fishing, not trolling with flies), and it is but the small ones that take it at all, as a rule. The big-sized small-mouths are seldom caught that way. Four years ago I saw a number of complaints about the black bass not being a reliable fish for the fly, etc., but nearly all these articles were from Pennsylvania, New York and Ohio, and referred to the small-mouth. If the writers had tried the large-mouth they would probably have changed their opinions. I have caught the large-mouth black bass in running waters, in ponds and in lakes. Swift running water is the best for fly-fishing. The statement that they invariably like mud and weeds, and go nowhere else, is simply not true.

I have caught the large-mouth in the Amite, in East Baton Rouge Parish, La., as clear and pure a river as any trout stream I ever saw in New England or Canada, and I have fished when a boy in many of the waters of that section. The upper Ouachita, in Arkansas, is another clear stream and is full of them, as are all the clear rivers and creeks through the piny woods in Alabama and Mississippi. I was glad to see a defense of the large-mouth by "Salmon Roe," of Newport, Ark., a short time since in the FOREST AND STREAM. I have fished in many of the streams of "Old Rackensack," and agree with all of "Salmon Roe's" statements as to the merits of the large-mouth. The large-mouth is just as gamy when hooked (if not more so) than the small-mouth. In saying this I am backed by the authority on the black bass, Dr. Henshall, who in his "Book of the Black Bass," writes:

"There is a widespread and prevalent notion that the small-mouthed bass is the 'game' *par excellence*, but I doubt if this distinction is well founded. In common with most anglers I at one time shared this belief, but from a long series of observations I am now of the opinion that the large-mouthed bass, all things being equal, displays as much pluck and exhibits as untiring fighting qualities as its small-mouthed congener."

Whenever the merits of two game fish come up for discussion there is one simple question that will decide at once their respective merits; and that is—which takes the artificial fly the best?

CYRTONYX.

FORT STANTON, New Mexico.

THE MINNESOTA LAKE PARK REGION.

IF any of your readers wish to borrow "sucease of trouble," let them gather together their fishing kit and spend a week or two at some of the numerous lakes around Detroit City, Minnesota. "Wawayanda" has sung the praises of Loughborough, and "Kingfisher" is now chanting a præan anent Carp Lake, but some day, when the divine afflatus seizes me in its irresistible grip, I shall blow a Pyrrhic blast about the Lake Park Region of Minnesota, that will make them pale their ineffectual fires. I could tell of one modest angler who took sixty-two bass—smallest 2½, largest 4½ pounds—in three half-day fishings, besides pickerel, pike-perch galore, and who, had he been a "fish hog," could have doubled, yea, trebled the slaughter. Come try the hospitality of Colburn, of the Hotel Minnesota, or of the St. Louis Club House, three miles down the lake, or, if ye be true anglers, leave the town behind, take a boat down Pelican River, through Lakes Sallie and Melissa, into Lake Pelican, and if black bass and wild raspberries don't surfeit your soul, drop me a line and I'll come down, swear you to secrecy, blindfold your eyes, and take you "over hill, over dale, through bush, through brier," to Witch Lake, original and unknown, save to Fidus Achates and myself. There be *Micropterus salmoides* and *M. dolomieu* lurking in wait for the wriggling shiner or the speckled frog; there the great lake pickerel, savagely impatient for the glittering spoon, and apt to smash the treble hook with the first clutch of his iron jaw; there the croppie, alias the Campbellite, alias the newlight, alias the bream, alias the roach, alias the "pot-kiver," who, if he be of the regulation weight of a pound or a pound and a half, will give your six-ounce rod all it wants to do to turn him, and who, if you give him the chance, will take a coachman, a professor or a red ibis with all the fierce dash and vigor of *Salmo salvelinus* himself.

I went down to Detroit chiefly to try a new rod which I had just finished—handle 18 inches of red cedar, two joints of bethabara, total length 8½ feet, weight 6¼ ounces. The first three fish I struck were, respectively, a four-pound bass, an eight-pound pickerel, and a six-pound pike-perch. To test the rod I gave the pickerel the butt with full vigor; result, I am aching now for a fish large enough to break that rod. Split bamboo is good, lancewood is better, but, as my boatman yelled in ecstasy, "Hain't that bath-berry a daisy." For years have I been seeking the *ne plus ultra*, the seek-no-further, the *Ultima Thule*, as it were, of a rod, and now I cry "Eureka!" Henceforward and forever I am the champion of bethabara. At Detroit some of us tested the bethabara, the split bamboo, lancewood and greenheart. The four rods were "pretty much of a muchness" in weight and length. Each one was clamped at the butt, so that seven feet were clear. A four-ounce weight was then attached to each tip, and the deflection from the horizontal measured. Result—split bamboo 7¼ inches, lancewood 5 inches, bethabara 4½, greenheart 4. The weights were allowed to remain on eight hours, then removed, and the permanent deflection measured. Split bamboo 3 inches, lancewood 2½, greenheart 1½, bethabara ¾ inch. Stiffness and elasticity combined, you see, ahead of all the others. It has one drawback; it's the meanest wood to work that ever taxed the patience of a saint—or a fisherman. Nothing but patience and a wood rasp is of any avail. To try to reduce it by a plane, drawing knife or spoke shave, is but vanity and vexation of spirit.

While staying at the St. Louis club house, a German acquaintance from St. Louis was fishing a few yards from shore, using live minnows. Time after time his line would steal slowly out, but when he struck he failed to hook his fish. Disgusted at last, he spit upon his hands, took a firm grip of his pole, and the next time struck savagely and hooked something. Those who were watching from the shore were sure, from the resistance shown, that he must have hooked a muskallonge, but soon yielding to the steady pull, there appeared above water, first a long bill, then a snaky neck, and then the water was lashed to a foam by what appeared to be waving wings and splashing feet. The astonished fisherman, with a gasp of, "Mein Gott! it ish de devil!" dropped his line and retreated to the other end of the boat, while the uncanny thing at the other end of the line gave a great flop. There was a momentary turmoil, and away, with a diabolic "Ha! ha!" sailed a loon, with twenty feet of good fish line streaming from his bill. Not having seen the occurrence myself, I can't, of course, swear to the truth, but those who know A. B. Bowman, of St. Louis; Samuel Spalding, of Chicago; Van Tyle, of Cleveland, or Filley, of St. Louis, know their word is as good as any man's, and they are my authority.

H. P. UFFORD.

PHILADELPHIA NOTES.

SHEEPSHEAD are biting well at Great Egg Harbor Bay this week. Boats from Somers Point are bringing in many. They are taken at the old wreck near the inlet. The ice of last winter it is said carried out the bass in the Brandywine, and the fishing there this season is poor. Steps have been taken by ex-Sheriff Thomas Henderson, of Union Furnace, Huntington county, Pa., toward indicting the proprietors of the Tyrone paper mills, for polluting the Juniata River with poisonous chemicals from their works. Thousands of bass have been killed and the mortality of the cattle watered in the stream has been so great that the farmers have had to keep their flocks from going near it.

A meeting of the State Fishery Commission was held at Harrisburg on July 22, to arrange for the distribution of the $25,000 appropriation lately made by the Pennsylvania State Legislature. It was apportioned as follows: For a whitefish hatchery at Erie, $5,000; for the improvement of the western hatchery at Corry, $1,000; for the erection of a fishway at Columbia Dam, $9,000, and for current expenses for 1885 and 1886, $10,000. Messrs. Gay, Duncan and Porter were appointed to arrange for the Erie hatchery and improvements at Corry, and Messrs. Spangler, Derr, McGinnis and Gay to procure plans, etc., for the fishway at Columbia.

The corresponding secretary was ordered to communicate with the sheriffs and commissioners of the counties bordering on the Delaware, Susquehanna and Schuylkill rivers, with a view of having existing fish laws more strictly carried out, and to consult with the Attorney General in regard to the legality of the claim of the Reading Railroad for repairs to the fishway now at Columbia Dam.

Important arrangements for the employment of fish wardens on the Susquehanna, Delaware and Juniata were made. The move made by ex-Sheriff Henderson against the Tyrone paper mills grew out of the late activity of our State Commissioners, and an opportunity will be given the paper manufacturers to abate the nuisance. If this is not done action will be at once taken. No bluefish appeared at Barnegat this week.

HOMO.

BASS HIBERNATION.

Editor Forest and Stream:

The cause of the hibernation of black bass seems to be attracting the attention of many of the readers of FOREST AND STREAM. With us this fish is considered extremely sensitive to cold, ceasing to bite immediately on the appearance of cold winds, both in the spring and fall. One illustration: The 20th of October bass had been biting freely off the east end of Middle Island, Lake Erie. The morning of the 21st was ushered in by a cold wave from the north. Not a bass bit that day nor the two days following. On the 24th the wind changed to the south, with a rise in the thermometer of 20°. Immediately the bass gave abundant signs of life and sport; schools of a hundred or more at a time could be seen breaking water around the boat, so voracious as to often seize the bare hook or lead sinker. During the period of absence of this fish the pike-perch and herring (*C. clupeiformis*) were caught daily in great numbers, the fall in temperature seeming to have no effect upon them.

It does not seem possible that a lack of food has any connection with the hibernation of this fish; ninety per cent. of its food here, and especially around the islands at the head of the lake, is made up of the lake shiner (*Alburnus vulgaris*). It is rare you find any other food in their stomachs, and it is the principal bait used to lure them. To be sure, they will take crawfish, silver spoons, artificial flies of the red ibis and black ephemeral stripe, frogs and helgramites. One of the best baits I ever tried is a bit of pork rind, cut out minnow-shape and fastened on the hook with a bit of copper wire. It has the advantage of lasting two or three days, certainly a great comfort to the unscientific angler, when this individual counts up the largest score at night. The general conclusion is that black bass are not as particular about food as reported, but for steady diet the bass prefers the shiner. It is silvery, toothsome and easily digested; is found in schools of countless millions every day in the year, and furnishes the bait for pike-perch and other winter fishes, but no bass are taken at such times in these places, though abundant in the right season.

As soon as the late fall storms from the north chill the waters down to 45° Fahr., the black bass hibernate in great numbers among the rocks and places sheltered from the action of the waves in rivers and estuaries, where the water weed (*Elodea canadensis*) abounds he, in company with the large-mouthed, straw bass and sunfish (*Pomotis*) are found in great masses taking their winter's sleep. This water weed grows on and near the surface in great submerged masses, so dense as to arrest the passage of a skiff or hunting boat through it. With the first heavy frosts it sinks to the bottom and forms a perfect bed for all the hibernating fishes. Here they pack in such numbers that twenty to thirty barrels of fish have been taken at a single haul of the seine through the ice. On one occasion, as I am credibly informed, seventy-five barrels were taken from one of these beds in two days' fishing within an area of three acres, covered with this sunken weed. All had to be brought to the surface of the ice with the imbedded fish. None of the non-hibernating fishes, such as pike, perch, pickerel, muscalonge and shiners, are ever taken in these hauls. We have heard of the black bass being speared through the ice, also the gar pike (*Lepidosteus*), the most sensitive to cold of all our fishes, unless it be the cat (*Pimelodus*), and even one of these was taken through the ice last winter at Dover Bay by one Mr. Moore. He was fishing through the ice with shiners for bait, taking pike and herring as fast as his cold fingers could handle them, when to his surprise a ten-pound catfish was hauled out in the usual way. As he remarked to me, "I was as much surprised when I saw that cat as though a humming bird had lit on my finger." One swallow does not make a summer, neither does the appearance of these hibernating fishes out of season make them the less so. We will call it a freak of nature by way of easy explanation.

DR. E. STERLING.

CLEVELAND, O.

THE SIX-INCH TROUT LAW.—A correspondent sends us the following notes from the Watertown, N. Y., *Times* of recent dates: "Dr. Boyd, of Pulaski, during a week's fishing at Redfield, captured 760 trout. Last week a party left Pulaski for two days' fishing at Redfield Square, eighteen miles distant. During the two days they caught sixty-two pounds of dressed brook trout, besides what they required for eating. While Baldwin was hauling in a three-quarter pounder he had the misfortune to fall over backward into the water. He struck on his back and went under. Sutton said to him, 'Save it, George,' and as he came to the surface with the water streaming from his mouth and eyes, he answered, 'You bet I will. There are more down here.'" Our correspondent adds: "The trout in Redfield and other streams of this locality have become small. I find six or eight below six inches to one above and believe it must be so with others. Large catches are freely mentioned. It is too bad, but the six-inch law seems to all but a few to be a dead letter."

MORTALITY AMONG FISHES.—A report has been made by Prof. S. A. Forbes, of the Illinois State College, on the mortality among the perch of Lake Mendota. The Professor believes that death was due to a spherical germ which is about 1-25,000 of an inch in diameter and is found in the liver and kidneys, sometimes forming abscesses and destroying the cells of those organs. This germ resembles in a general way those which produce certain diseases among men and animals, such as small-pox, chicken and hog cholera. These diseases often break out among fishes in waters where a certain species increases until it seems to need thinning.

CLASSIFICATION OF ANGLERS.—The London *Fishing Gazette* playfully classes anglers after the mode of ornithologists, thus: "* * * Be they *Grallatores* (waders seeking their scaly prey in shallow waters), or *Natatores* (paddlers breasting the current in skiff, punt, canoe or coracle); be they *Insessores* (perchers on the slippery beam of a weir 'on perch intent'), or be they simply of the vast longshore family of banksters," etc.

THE CHANNEL CATFISH (*Ictalurus punctatus*, Rafinesque).—The channel cat reaches a length of 2 to 3 feet and a weight of 15 to 20 pounds or more. As usually seen in the markets it ranges from 1 to 5 pounds in weight, and those exceeding 5 pounds are not common. It is handsomer, more graceful, and more active than any other of our catfishes. It is light olivaceous and silvery in color, covered with small brown spots when young. The skin is thin and translucent, much less thick and leathery than in our common catfishes (*Amiurus*). The head is small, the mouth small, and the body slender. There is much less waste in the body of the channel cat than in other fishes, as the latter lose more than half their weight by the removal of the head, the entrails and the skin. The flesh of the channel cat, when fresh, is very superior; it is white, crisp and juicy, of excellent flavor and not tough. It is much more delicate both in fibre and in flavor than that of our other catfishes. When well cooked, I consider it superior to that of the black bass, the wall eye, the yellow perch, or any other of our percoid fishes. Among our fresh-water fishes, it is inferior only to the whitefish, the trout, and other *Salmonidæ*. The channel cat abounds in all flowing streams from Western New York westward to Montana and southward to Florida and Texas. It is, perhaps, most common in Tennessee, Arkansas, and Missouri. It seems to prefer running waters, and both young and old are most abundant in gravelly shoals and ripples. The other catfishes prefer rather sluggish waters and mud bottoms. I have occasionally taken channel cats in ponds and bayous, but such localities are apparently not their preference. They rarely enter small brooks unless these are clear and gravelly. Whether they will thrive in artificial ponds we can only know from experiment. The channel cat is much less tenacious of life than the "bull-head" (*Amiurus nebulosus*) and other *Amiuri*. It is a carnivorous fish, although less greedy than its larger-mouthed relatives. It feeds on insects, crawfishes, worms and small fishes, and readily takes the hook. It spawns in spring, but its breeding habits have not been studied. As a food fish, the channel cat is certainly better worthy of attention than any other American catfish. If once introduced, it ought to thrive in the rivers of the Middle States, of Southern New England, and of California. It is also to be commended to the attention of European fish-culturists. In the streams of Western Europe, which are not cold enough nor clear enough for the trout, the channel cat ought to thrive, and there is no fish native to those waters which is as valuable for food.—*David S. Jordan in Bulletin of the U. S. Fish Commission.*

BASS FISHING.—Putnam, Conn., July 17.—Fishing in this part of the country has been good this spring, and now the fraternity are after black bass, and are bringing in good strings. Speaking of bass tempts me to give FOREST AND STREAM readers my first and only day's bass fishing as yet this season. A friend of mine who never saw a bass caught wanted to go with me. We went to Webster Pond one day this week. After taking some fifteen or twenty bass of small and medium size, the larger ones began to fool around, and at this stage of the proceedings I thought I would try the old 9-ounce fly-rod, just to show my friend how the thing was done. A big swirl, a light yank, a rush, and the old click reel spun out the usual music, until forty or fifty feet of line was played out. "Where's your bass gone to?" "Look out yonder," said I. At that instant a small-mouth, 3-pound bass broke water, and shook himself two or three feet in the air. "Say, is that fish the one you are after?" "Well, yes, I should smile and say he was." The fish now makes a dive for the boat, but swinging her around in time the bass makes another leap forty feet on the other side of the boat. "Look out, he'll break your rod; he will break your rod." "Don't be alarmed, my friend; this rod has killed a 9-pound trout in rapid water, and I guess it's good for this." And in about three minutes that bass took a scoot into the landing net. My friend looked admiringly at the bass, and then at the rod, quietly remarking, "Well, it's worth the whole trip up here to see that fellow taken with that whip of yours." I do think there is more fight to the square inch in a small-mouth black bass than in any other fish that swims. And as I intend to spend a few days fooling with them about the first of August, and if any of the "old settlers" undertake to "telegraph" to me from their end of the line, I will tell the readers of FOREST AND STREAM what luck I had in "telegraphing" back to them.—W.

TROUT FISHING IN OREGON.—*Editor Forest and Stream:* I have noticed an occasional item in the columns of your paper giving specimens of "good catches" in Oregon. I wish to contribute another item that will not compare unfavorable with those that have happened before. In company with Captain Fowler, of the Second Cavalry, U. S. A., stationed at Fort Klamath, Bishop Morris, of Portland, and myself spent several days last month on Williamson River in Klamath county, Oregon, testing our fishing tackle and the quality of the trout that abound there. Unfortunately we did not keep a record of all the fish taken and so cannot give the total number or weight. There were caught at that time, however, several whose weight was not forgotten. The Bishop landed without gaff or net and with an eight-ounce rod, one that weighed 6 pounds 10 ounces. I had the good luck to land three that together weighed 18 pounds 5 ounces. Captain Fowler also landed several that weighed over 5 pounds. The fish were taken with eight-ounce rods and large flies. The coachman was the favorite. I have never seen fish more gamy or make a better fight. They were in every respect similar to the Rocky Mountain trout that abound in the streams on this coast. Captain Fowler, whose enthusiasm for fishing is only equalled by his generous hospitality, states that trout were taken from the river this spring that weighed over eight pounds and I can well believe it. Having cast flies in many streams in the State I have come to the conclusion that there is but one place to fish and that is in Williamson River.—W. E. POTWINE.

THE BRACK PRINCE.—Chicago, July 25.—*Editor Forest and Stream:* Some time ago in your valuable paper under the heading "The Most Killing Fly," I described a fly of which I did not know the name, and the description agrees exactly with that of "Cyrtonyx" in your issue of the 23d inst., save that mine had a long red tail instead of shoots as he describes it. I never knew the name of the fly until "Cyrtonyx" named it, and it is certainly one of the most killing flies for Colorado and New Mexican streams. This fly having proved so tempting to the *Salmo virginalis* tribe, I set to work (though no fly-maker) and made myself some flies exactly like it save that I used silver tinsel twist in place of the gilt; this proved, if anything, more killing than the black prince, so I named it the black killer. If Mr. Hart will send me his address, I will be most happy to send him a black prince, black killer and several other flies that I have found remarkably good in Colorado waters, and if I can give him or any of my fellow sportsmen any information regarding the trout streams, ponds and lakes of Colorado or New Mexico, I shall be most happy to do so. "Next!"—SPORT.

MARYLAND NETTING.—Fairlee Creek, Kent County, Md., July 16.—While the oyster law of Maryland is strictly enforced, the seine fishermen are hauling day and night, taking great quantities of rock, pike, etc., and destroying thousands of small fish. This is a grand game and fish country; but this constant seine-hauling will tell in the course of time. Fishing with hook and line for private use could never make any perceptible difference, but will not the guardians of the law look after the wholesale destroyers? Most of them belong in other States, where they cannot haul seine at this time of the year.—EVERETT VON CULIN.

A GLANCE AT BILLINGSGATE.

BY WILLIAM VAN ZANDT COX.

[A paper read before the American Fisheries Society.]

THE Thames being the highway to London and originally the source of its fish supply, it was very natural that some point upon it should become the center of the fish trade. Billingsgate has for centuries been that point. As to the origin of the name there are many traditions. One is that Belin, an ancient Britain ruler, who lived three or four centuries B. C. and was held in great reverence by the fisher folk, constructed a gate in the immediate proximity to the present market and gave it his name.

Stow, a very practical writer, after considerable research, comes to the conclusion that a Mr. Beling or Billing, in the time of Elizabeth, had a wharf there. This commencement, though less flavored with romance and more of fish than others, we think more than likely was the beginning of this unpoetical fish mart. The market has been the property of the city of London for centuries, and the revenues derived from it, though no statistics seem to have ever been compiled on the subject, must in the aggregate be enormous.

Originally the market was very primitive both in structure and equipments, indeed, until within the memory of those still living, it consisted of "a batch of uncleanly old sheds reeking with fishy smells and more or less beset by ruffianly company."

The language used by those who frequented it has, as is well known, become proverbial for its coarseness. At one time women were engaged in selling fish in the market, and it is said were largely instrumental in giving the place the bad name it bore, and though at this time it has entirely changed from what it once was, it still bears the stigma of coarseness in the minds of many, illustrating, says a clever writer, that "as in the case of men, the evil that women do lives after them."

The old sheds disappeared some years ago, their places being occupied by a building which in turn has given way to the present market. This structure extends north and south from the Thames River to Thames street and was built with the idea of having not only ground space, but also space in the basement below and the gallery overhead. The basement part was intended for shellfish dealers. But it was not occupied by them long, for being twenty-six feet below the level of the river, it was so dark, damp and disagreeable that few buyers cared to go there. Several deaths also occurred among its occupants, and those remaining being unwilling to stay longer in the "black hole," it was abandoned, except as a place of storage and for lobster boiling purposes. The overhead space was for dealers in dried fish and is connected with the ground floor both by spacious stairs and elevators. Being sought, however, by few patrons, it was also abandoned and its occupants went below and squeezed in, as did the shellfish dealers from the basement; so that at this time the entire trade is concentrated on the ground floor. Without going into details concerning the architecture of the building, it is sufficient to say that it is generally admitted that the corporation did not act wisely in enlarging the market at a great expense and in a way that is of no practical use, instead of widening the approaches to it on the Thames street side. The floors of the building are of polished granite, concealed beneath which are drains of iron for carrying off the dirt and refuse when the market is flushed, which is done daily at the close of the market hours.

At the present time there are 156 stalls and 14 shops on the ground floor. The former are located in the center, while the latter are on the sides of the building. There is also a tavern where fish are served as the leading article of diet. Formerly there were three taverns, Simpson's, Bowler's and Bacon's, where in other days the salesmen congregated before daylight, drank their black coffee and "aff and aff," ate fish and talked over the prices, sales and supply of fish for the coming day. In order to have more space, however, the number of taverns has been reduced to one, which now brings in a rental of $4,000 annually. The stalls vary in size, averaging 32sq. ft., according to the Clerk of the Market, Mr. John Little, to whom I am indebted for many courtesies. The stalls, according to location, bring from 10 to 18 cents per square foot per week, or an annual rental from $166 to $300 each. The shops bring from $1,700 to $2,000.

Avenues cross the market at regular intervals, and from necessity are very narrow. Great effort is required to keep them open, and the rules of the market are very explicit in regard to placing obstructions in them. Porters carry the fish into and from the market in baskets, boxes, crates, barrels, in fact in all kinds of ways. No one is permitted to perform the duties of porter without a license, for which he has to pay 2s. 6d. When on duty, in order to readily distinguish him, the porter is obliged to wear on his left arm a metallic badge having on it the armorial bearings of the city of London. If a porter misbehaves, uses any abusive or obscene language, gets intoxicated, steals, commits assault or violates any of the rules of the market, his license is at once taken from him. I was told that the present conduct of employes in Billingsgate so happily in contrast with "ye olden times," is due to rigid enforcement of rules similar in tenor to those just mentioned.

The porter's dress consists of cotton overalls, a coarse cotton shirt, worn on the outside of the trousers, which from the begrimed and bespattered appearance are very appropriately called "slops." The head is protected by a "porter's knot," a hat which has a cushion in the crown, very necessary padding, it might be remarked, as the rough and heavy "trunks" are either borne directly on the top of the head, or resting on the shoulders, back and neck. Wooden sandals are generally worn on the feet to keep the bottoms of the shoes from contact with the sloppy surface. The porter receives on an average about a penny farthing for carrying each box of fish to the salesman. The taking of it from the salesmen to the conveyance of the buyer is an optional charge, depending upon the kinds of fish and distance to be carried.

Land-borne fish enter the building on the Thames street side, while river-borne fish are brought into the market through the south door facing the river. The boats bringing them to London are not permitted to come alongside the building to unload, but, for some reason unknown to me, are required to make fast to fastenings provided for them adjacent to floating pontoons and barges that intervene. Planks, mostly unprotected by side rails, extend from boat to market about a hundred feet distant. Up and down and across these planks the porters tramp with their heavy burdens, for each trunk weighs about 100 pounds.

Nine steam carriers run to and from Billingsgate and the fleets in the North Sea, and bring the bulk of the water-borne fish. The unloading of these boats—indeed all kinds of craft—is an interesting sight. But let Sala tell the story: "This wharf is covered with fish, and the scaly things themselves are being landed with prodigious celerity and in quantities almost as prodigious from vessels moored in triple tier before the market. Here are Dutch boats that bring eels, and boats from the North Sea that bring lobsters, and boats from Hartlepool, Whitstable, Harwich, Great Grimsby, and other English seaports and fishing stations. They are all called boats, though many are of a size that would render the term ship, or at least vessel, far more applicable. They are mostly square and squat in rigging, and somewhat tubby in build, and have an unmistakably fishy appearance. Nautical terms are mingled with London street vernacular; fresh mackerel competes in odor with pitch and tar; the tight-strained rigging cuts in dark indigo relief against the pale blue sky; the whole is a confusion, slightly dirty but eminently picturesque, of ropes, spars, baskets, oakum, tarpaulin, fish, canvas trousers, osier baskets, loud voices, trampling feet and 'perfumed gales,' not exactly from 'Araby the blest,' but from the holds of the fishing craft."

The method of handling and carrying the fish may strike the author of "Twice Around the Clock" as one of "prodigious celerity," but to an American familiar with steam appliances and labor-saving machinery, it appears to be very tedious, costly, old-fashioned and in great contrast to systems seen with us, where a vessel puts in, unloads, packs up, and leaves the wharf in two hours.

Steam appliances have not been adopted at Billingsgate, I am informed, because the fish would be more rapidly brought to the salesmen than they could be handled, and so the old system is clung to, and porters with trunks on their heads approach the salesman, stand in waiting, then deposit them only as rapidly as they can be sold and again borne away.

The salesman or auctioneer gets five per cent. on the sales made. Many fish were formerly sold at "Dutch auction," where the salesman names a high figure, then drops to a lower one, and so on until a bid is made which is accepted, and the procedure is gone through with *de novo*. No license is required to sell fish by Dutch auction, and this method is still in great favor in many of the fishing ports.

The Bummaree appears to be an individual essential to Billingsgate.

Jonathan Bee, in his slang dictionary ("Lexicon Balatronicum"), published 1823, defines the bummaree to be the man who at Billingsgate takes the place of the salesman, and generally after 8 o'clock A. M., buys the last lot of fish.

The author of "London Labor and London Poor," 1853, says that at that time Billingsgate was opened at 4 A. M., but for two hours it was only attended by the regular fishmonger and the bummaree. At the present time, however, not only is the bummaree the first to arrive, but, as in 1823, he is the last to leave. He now purchases from the salesman and sells to small dealers, costermongers and consumers. Before making a sale the bummaree breaks the packages and assorts the fish, supplying the buyers with the kinds, sizes and quality desired. A very useful function it might be remarked when we remember that a "ped" often contains various kinds of fish, suitable and unsuitable for the uses for which they are wanted by different classes of purchasers. But however useful the bummaree may be, that such an individual exists at all, only goes to prove the inadequate accommodations of Billingsgate for the trade, and whether there is foundation or not for such accusation as are heard concerning him; the bummaree will exist so long as the fish supply of populous London has to pass through this limited inaccessible market in a limited time.

The market is opened at 5 o'clock in the morning and is practically over at 10 o'clock. Before the opening, however, the auctioneers are in their places, behind what are called "bulks" or "forms," upon which the fish are deposited in "trunks," "doubles," etc. Little if any opportunity is given buyers to ascertain the condition of the fish, for no sooner is the box deposited on the "bulks" than it is knocked down as sold, and again borne away. If the buyer is not informed in some way in regard to the condition of the fish, to purchase the unopened boxes so rapidly, and with such apparent indiscriminate recklessness, seems to an outside observer, to put it mildly, great confidence in the condition of the fish, and in the honesty of the salesman.

During the whirl of business all seems confusion and chaos. Porters are seen rushing hither and thither with reeking barrels, baskets and boxes. Auctioneers with long narrow account books in their hands are bawling to buyers, who, with hands by the side of their mouths, direct back their shouting answers, while the uninitiated explorer stands bewildered in their midst, until he is called to his senses by the exclamation, "Hout the way." "The only comparison I can find for the aspect, the sights and sounds of the place," says a well-known writer, "is a rush, a rush hither and thither at a helter skelter speed, apparently blindly, apparently without motive, but really with a business-like and engrossing pre-occupation for fish and all things fishy. Baskets full of turbot borne on the shoulders of the facchini of the place, skim through the air with such rapidity that you might take them to be flying fish."

"At that piscatorial house," says Bertram, ("Harvest of the Sea," p. 59) "we can see in the early morning the produce of our most distant seas brought to our greatest seat of population, sure of finding a ready and profitable market. The aldermanic turbot, the tempting sole, the gigantic codfish, the valuable salmon, the cheap sprat, and the universal herring, are all to be found during their different seasons in great plenty at Billingsgate, and in the lower depths of the market buildings, countless quantities of shellfish of all kinds stored in tubs may be seen, and all over is sprinkled the dripping sea water, and all around we feel that 'ancient and fish-like smell' which is the concomitant of such a place."

Commercially speaking fish are divided by the Londoner into two classes: 1. Prime. 2. Offal. The former comprehends the choice varieties, such as sole, bull, turbot, etc. The latter includes the commoner coarse kinds, such as place, roher, haddock, etc. The quantities that come into Billingsgate are very disproportionate. Mr. Little says that thirteen boxes of offal reaches the market to one box of prime. That gentleman has very kindly furnished me a table showing the quantity of fish arriving at Billingsgate per month during the year 1883, which I shall make a part of this paper, as also a series of tables showing the amount of fish coming to London since 1875. It will be seen from Mr. Little's statement that the quantity coming by water is much less than by land. Special trains bearing fish alone run daily to London from Grimsby, Hull, Yarmouth and other places. As these trains do not come in the vicinity of Billingsgate, the fish have to be carted through the narrow streets and tortuous lanes, across the city to the market in order to be sold, and when sold to be again carted over the same streets through which it has already with difficulty passed.

Speaking of the approaches to Billingsgate, the *Quarterly Review*, October, 1882, says: "Their badness was of comparatively slight importance so long as the bulk of the fish was brought thither by water. When, however, it became necessary to deal each year with some 90,000 tons of railway-borne

fish, and to deliver them at Billingsgate through choked streets and narrow lanes which would disgrace a town of 50,000 inhabitants, the difficulties were so augmented that fish vans sometimes took eight hours to get from the Great Eastern or Great Northern railway terminus to the market where they had to unload."

This statement has greater force when it is remembered that the width of the roadway of Lower Thames street, on which the market is situated, is but 16½ feet wide. St. Mary-at-hill has a width of 16 feet, while Botolph lane and Pudding lane are each but 7 feet 3 inches wide.

Language fails to convey to one's mind the bewildered condition of things in the congested approaches to the market, where the stopping of a "shandry," for instance, will block the entire street. It was shown in an investigation made by Spencer Walpole, late H. M. Inspector of Fisheries, that ordinarily it not only took hours for fish vans to reach the market, but in one instance a van of "fresh fish" was eleven days en route, and all the time trying to get unloaded. A vast amount of good food is very naturally spoiled before it reaches the market, and afterward too for that matter, simply from the absence of proper appliances for its preservation; and it is not strange that when the fish reach the consumer it is so enhanced in price as to have become a luxury instead of an ordinary article of diet.

The Times of Oct. 30, 1883, despondingly asks, "Could not science have fish vaults where the temperature was kept at about 33 deg. at the markets? Could not science improve on the ice chests fishmongers use?"

We answer unhesitatingly in the affirmative, and cordially invite the editor of the "Thunderer" to visit America and see the fish markets in Boston, New York and other centers, where the application of scientific methods of refrigeration to the fish trade that have long been in use would be seen.

What London requires in order to have the price of fish reduced and the quality improved, and a cessation from talk about "Billingsgate ring" and "Billingsgate monopoly," is to have a more commodious market, a market with refrigerating appliances, a market on the river side, easily accessible not only for boats, but for cars, vans and all kinds of conveyances.

Thus far it has been impossible to agree upon a new site. If the market has to remain where it now stands, so choked for space and difficult of approach, then if it be desirable to remedy the patent evils, the streets leading to Billingsgate will have to be widened. The postponement of the widening to a more convenient season will not lessen the cost. In 1862 the approaches could have been widened for £88,000, but twelve years afterward the estimated cost was £525,000, and now, doubtless, it would be much more.

In conclusion, I regret to say there is little, if anything, at Billingsgate for American fish dealers to learn, except how far in advance of them in every respect we are on this side of the Atlantic.

RETURN OF THE QUANTITY OF FISH DELIVERED AT BILLINGSGATE MARKET DURING THE YEAR 1883—(JOHN LITTLE, CLERK, BILLINGSGATE).

Month.	Land carriage, Tons.	Water carriage, Tons.	Total Tons.
January	6,015½	2,949	8,964½
February	5,562½	1,969	7,531½
March	6,983¾	2,022	9 605¼
April	6,894	3,911	10,305
May	5,898¾	4,765	10,663¾
June	8,556	4,679	13,215
July	5,400	3,353½	8,753½
August	5,678	3,486	9,164
September	7,104½	4,671	11,775¼
October	6,583¼	2,028	8,611¼
November	7,401¾	1,984	9,385¾
December	9,166¼	2,529	11,695¼
Total	80,723¼	38,946½	119,669¾

N. B.—There was also from 20,000 to 25,000 tons of fish delivered in the immediate vicinity during the year which is not included in the above.

The quantity destroyed by the officers of the Fishmongers Company, as being unfit for food, was 273 tons, 16 cwt., 1 qr., and of this 95 tons was composed of shellfish.

APPROXIMATE QUANTITIES OF FISH DELIVERED AT BILLINGSGATE MARKET AND VICINITY, 1875-1884.

(British Fisheries Directory and Mr. Little's Report.)

HOW TO DISTINGUISH THE SEX OF CARP.

WHEN the adult fish is nearing the spawning time the ripening of the ova produces a broadened appearance in the female, which is sufficient to enable most any one to distinguish the sex. It is necessary, however, to be able to distinguish them at a much earlier age, and this, although not generally understood, is declared by experienced fishculturists to present but little difficulty. Dr. Hessel, superintendent of the United States Government ponds, scarcely ever fails to identify the sexes, although he declares his inability to decribe in words the manner in which he does it. The German carp-culturists, however, have distinctly stated their method.

Horák, in a work published 1869, and entitled *Die Teichwirthschaft mit besonderer Rücksicht auf das südliche Böhmen. Ein populäres Handbuch für Teichwirthe, Fischereibedienste und Freunde der Fischzucht*, by Wenzel Horák, says: "Fishermen who are not able to determine the sexes of the fish at once are in the habit of squeezing the genital parts until they yield either milt or roe. This method is very injurious to the production of young fish. An experienced pond-culturist will, at the first glance, distinguish a male from a female carp, even when they are only one year old. The milter, or male fish, has a depression or concave place in its genital parts, while the spawner, or female fish, has a protuberance or convex place."

Carl Nicklas, perhaps the most skilled carp-culturist at present living in Germany, indorses the above quotation from Horák, and adds: "The aperture of the genital orifice also seems to be somewhat larger and redder in the female than in the male. It is not very difficult to distinguish the male from the female carp; still, it may require a little practice." Prof. B. Benecke, of Königsberg, says: "As a general rule the belly of the spawner is broader and rounder; the genital aperture is larger and reddish and has thick lips, while in the male it forms a narrow slit.

Apparently without any knowledge of these German authorities, George M. Ramsey, M. D., of Clokey, Pa., writing under date of November 22, 1883, says: "I have discovered how to distinguish the sex of German carp at all seasons of the year. By inspection of the female carp a small fleshy protuberance, that pouts a very little, will be seen in front of the vent, whereas in the male carp the same is slightly depressed or sunken rather than protuberant. On examination each fish should be held up to the light in the same position, back downward." Evidently Dr. Ramsey has made an independent discovery of what was already known in Germany.

Among the most successful of the Americans who have received carp from the United States Fish Commission is Mr. Kemp Gaines, of Springfield, Clarke county, Ohio. He had young fish to sell as early as the summer of 1883, and seeing the necessity of furnishing applicants with the proper number of males and females, he undertook to see if he could discover any method of distinguishing sexes. November 21, 1883, he reported his observations to the Fish Commission. On examining the carp taken for table use he found a difference in the form of the head and surmised that this might possibly indicate the sex. He put it to test during the summer whenever he dressed fish for use and failed to distinguish the sex but once.

It would be gratifying if those who have carp would put these methods severely to test and report to the Fish Commission their success or failure.—*Chas. W. Smiley* in *Bulletin U. S. Fish Commission.*

FIXTURES.

BENCH SHOWS.

Sept. 22, 23, 24 and 25.—Dog Show of the Milwaukee Exposition Association. John D. Olcott, Superintendent, Milwaukee, Wis.

Oct. 6, 7, 8 and 9.—Fourth Annual Dog Show of the Danbury Agricultural Society. E. S. Hawley, Secretary, Danbury, Conn.

Oct. 27, 28 and 29.—Twelfth Dog Show of the Western Pennsylvania Poultry Society, Pittsburgh, Pa. C. B. Elben, Secretary.

FIELD TRIALS.

Nov. 9.—Second Annual Field Trials of the Fisher's Island Club, for members only. Max Wenzel, Secretary, Hoboken, N. J.

Nov. 9.—First Annual Trials of the Western Field Trials Association, at Abilene, Kan. Entries close Oct. 15. A. A. Whipple, Secretary, Kansas City, Mo.

Nov. 16, 1885.—Seventh Annual Field Trials of the Eastern Field Trials Club, High Point, N. C. Entries for Derby close May 1. W. A. Coster, Secretary, Flatbush, L. I.

Dec. 7.—Seventh Annual Field Trials of the National Field Trials Club, Grand Junction, Tenn. Entries for Derby close April 1. B. M. Stephenson, La Grange, Tenn., Secretary.

A. K. R.—SPECIAL NOTICE.

THE AMERICAN KENNEL REGISTER, for the registration of pedigrees, etc. (with prize lists of all shows and trials), is published every month. Entries close on the 1st. Should be in early. Entry blanks sent on receipt of stamped and addressed envelope. Registration fee (50 cents) must accompany each entry. No entries inserted unless paid in advance. Yearly subscription $1.50. Address "American Kennel Register," P. O. Box 2832, New York. Number of entries already printed **2519.**

IS THE A. K. C. TO LIVE?

Editor Forest and Stream:

The above question is pressing just now. Many of us, who did not prefer the form of organization the A. K. C. took, have come to think that as it is organized and in working order, it is better to make it an efficient factor in kennel matters than to get up a rival club; but how it is possible to make such a club even respectable, much less efficient, when its path is one string of blunders; wherever it goes, whatever it does, blunder, bungle and botchwork marks out its path.

At the Philadelphia meeting, Messrs. Morgan, Childs and Osborn, with what help I could give, endeavored to start the club toward better things than had marked the past. Major Taylor seemed willing to help us on, but was also ready to fall into any pithole that could be found and drag the whole A. K. C. along. The attempt to run in a county fair association at Dayton, O., when the constitution plainly provides that members must be organized wholly or in part for holding bench shows, was one sample. The grave proposal to "recognize" the American Spaniel Club and the International Cocker Spaniel Association in the joint work of preparing a standard on cockers, was stupendous! Imagine a "standard," the result of the joint efforts of two clubs whose separate existence seems only due to the fact that they cannot agree on a standard! Fortunately both these blunders were staved off. Then there was the mistake of appointing Mr. Elliot Smith on the "St. Elmo" committee when he was the defendant! Did you ever hear the like? Then Pelion was piled on Ossa by Mr. Faxon being added to this committee when he was not a member of the Executive Committee! Allowing that these last blunders may be passed over on grounds of oversight, what possible excuse is there for the added blunder of appointing Mr. Nickerson on the committee when he is also ineligible because not a member of the Executive Committee. I shine as the bright particular light on this business, as being the only one of four so far appointed who is eligible; but I should not have been appointed after my open statement that the close intimacy so long existing between Mr. Watson (the appellant in the case) and myself, made my appointment at least "bad form."

With nothing but the kindest feelings toward Major Taylor personally and as a judge, I cannot but say that the only hope for the A. K. C. is in his resignation. His whole administration has been a series of blunders, his appointment of Mr. Nickerson the worst, because his blunder in Mr. Faxon's case had been pointed out, yet he makes the same bungle over again. I challenge the naming of a single instance where Major Taylor has gone right in his official course as president, when there was a chance to go wrong. "Construction" was bad enough, but it has been capped by a continual string of helpmates. What are we to do? Are we to try and keep up a continual fight and watch against blunders that a member of a primary school debating society would know were blunders, or are we to cut loose from the A. K. C., and let it die of public contempt? Really this thing of being made a public laughing stock is getting somewhat monotonous. To such organizations as the N. E. K. Club, the Eastern Field Trials, the New Haven, Philadelphia and Pittsburgh clubs, the main stays of dog shows in the country, I would say, do you propose to do anything for the unfortunate A. K. C., or shall it perish of public ridicule?

Lest I may be suspected of personal animus against Major Taylor, let me say that his declaration that he gave a dog first at Philadelphia when he would not have done so had the standard been less on head, is to me convincing proof of his honesty as a judge, and just what every judge should do, subordinate his own preferences to the established authority on the matter; and if Major Taylor prefers a standard with less value for head it is a perfectly legitimate thing to try to so establish it; the only requisite being that fair play be allowed others of different views. Mr. Nickerson advises me (much to my regret) that he is ineligible and has therefore resigned.

While the A. K. C. still has a nominal existence, let me point out a serious mistake in Rule 2, providing that a dog must be identified by its date of birth; this is often impossible. We are all responsible for this mistake, as it was substituted for the old rule that a dog must be identified by its age. This is objectionable, as often litter brothers or sisters are entered as of different ages, as was the case with the mastiff litter sisters Hebe and Dido II. at Philadelphia, and we seem to have overlooked that putting this requirement before "and if known" left the exhibitor with no chance of escape from what might often be an impossibility. The rule evidently should be, a dog "must be identified by its name, and if known, its date of birth."

W. WADE.

HULTON, Pa., July 25, 1885.

CRYSTAL PALACE DOG SHOW.

THE English Kennel Club held their twenty-fifth exhibition of sporting and non-sporting dogs on the grounds of the Crystal Palace Company, under tents, on the 7th, 8th, 9th and 10th of July, and the exhibition on the whole was equal to any of their former gatherings. There were six judging rings, and the awards were all handed in on the first day, the judges being, for mastiffs and bloodhounds, M. Beaufoy, Esq.; St. Bernards, H. J. Betterton, Esq.; Newfoundlands, H. R. Farquharson, Esq.; foreign dogs and Great Danes, R. Groom, Esq.; deerhounds, greyhounds, black and tan setters, Irish setters, retrievers, collies and bull-terriers, S. E. Shirley, Esq.; pointers, S. Price, Esq.; English setters, W. D. Duncan, Esq.; spaniels, Rev. A. L. Willett; dachshunde and Basset hounds, H. Jones, Esq.; bulldogs, J. S. P. Sellon, Esq.; Dandie Dinmonts, the Earl of Antrim; pugs, G. Weekley, Esq.; Irish terriers, Dr. Carey; wire-haired fox-terriers, Airdales and Bedlingtons, A. Maxell, Esq.; smooth fox-terriers, T. Bassett, Esq.; Skye and Scotch terriers, J. Pratt, Esq.; the remaining classes, J. Percival, Esq.

The total entry was 1,288, rather less than at the winter show, yet the quality was real good, and most all of the class were remarkable for the quality and the keenness of the competition.

Crown Prince once more headed the list in champion mastiffs and won the 40-guinea challenge cup for the best mastiff dog in the show. Cambrian Princess winning first in champion bitches, also the 40-guinea cup for the best bitch. We consider, however, that she was very closely pressed by the brindle Lilly II., who is a really good bitch all through, and moves much better than Cambrian Princess. In the open dog class, Dr. Turner exhibited two very promising young ones, Beaufort and Hotspur, the former winning while the latter got vhc. In the puppy class they won easily first and second. Hotspur is some two months the younger, and of course more improvement may be expected in him than the winner, who got most of the advantage by superior size. The second prize dog, Prince of Wales, is only a moderate specimen. He has been winning lately in Scotland. He is only a medium-sized dog, but with a well-shaped body not in high condition at present; his muzzle before the eyes is too long and not deep enough. John Bull, third prize, we have reported before. He is small in size, not enough of wrinkle and might have more bone, but is of a good type. Bismarck, vhc. We don't like his color as a fawn, and his eye is rather light, yet he is a fine upstanding dog and about the largest in the class; but not in the condition we have seen him, otherwise we think ought to about win in the present company. In bitches Dr. Turner won first and second; both are good in type but we much preferred the second prize, The Lady Isabel, as she was the largest and the best mover with a very good head. The actual winner was rather the best in head and color of mask, but small, low at the shoulder and a bad mover. Third went to Princess Ida, good in face and wrinkle, rather large in ears and not so good in body as those placed over her. Mr. Nichols showed a very large and powerful young dog in Victor Hugo. He is rather plain in face, but possesses great size with good feet and legs. He has all the appearance of growing into a most powerful dog. The winner in bitch puppies was promising and a long way ahead of the others. The produce stakes was simply a walk-over for Dr. Turner.

In the champion class for St. Bernard dogs Save had an easy win over Bayard. In champion bitches we consider Cloister very lucky in winning, being out of coat. Ilfreda, second, was also a little out of coat and thin in flesh, otherwise she might have stood first. Madam, vhc. and reserve, is a grand, upstanding bitch, in good coat. She was shown in Mr. Smith's usual high condition. In the open class Duke of Wellington, third, is a grand dog, good in color and markings, with good coat not fully grown at present. His condition was against him, otherwise he might have exchanged places with the second prize winner. Nero III., whom we have often reported, was here, looking well. First went to Plinlimmon, also special for the best in the open classes. This dog was looking better than ever, and changed hands during the show at £800, the highest prize ever obtained for a St. Bernard in England. Vhc. reserve, Saracen, is a good dog, with good legs and feet. We don't admire his color, and doubt if he will run much further forward. Bernina II., fourth prize, is a good stamp on the small side. Grip, hc., is heavily handicapped by his badly carried ears. Kenneth was out of condition or he might have been further up. In the bitch class we think Mabel II. ought to have been noticed. The brindle and white La Mascotte, out of coat, won second prize. Recluse, from the same kennel, might be better on forelegs, and is on the small side, yet of a good stamp. Queen Jura, vhc., the Warwick winner, is a grand bitch, but has not enough of markings; in fact, she is almost self-colored, otherwise she was about the best bitch in the show. Thetis, the winner, we admire very much. She is a large bitch, with good body, color, and coat, and shown in the best of condition. Dolly, hc., has a Dudley nose, large ears and light eyes. There were some much better unnoticed. Melita, vhc., is a good bitch, but too fine before the eye. Vhc. and reserve Dacia is a nice-colored and marked bitch.

In smooth dogs first went to Sirius, looking his best. Lord Wolsely, looking better than we ever saw him, made a good second. Victor Emanuel seems going worse. The smooth bitches were a good class, some thought that Lady Superior should have won. The second prize winner is too fine in muzzle. There was nothing likely to come to the front among the puppies.

The challenge classes for Newfoundlands had only one entry each. So that in each case it was a walk-over. In the open class for black dogs Lord Nelson won easily, but was beaten by Courtier for the special for the best in the show. We preferred Lord Nelson and think that opinion was shared by the majority. Admiral Keppel and Gift are both small and rather light in eye, while Black Watch shows the haw. Isla won well in bitches; second going to a good-sized bitch not good in back.

Great Danes, as usual at the Palace, were one of the features of the show, there were four entries in the challenge class. Sultan II. was absent. Cedric the Saxon won also the cup for the best in the show, Mirza getting the challenge cup for the best bitch; they are both good ones, in fact all through, the classes were remarkable for quality, yet we saw nothing in the puppy classes like being A1. Mr. Messter, of Berlin, carried off the majority of the prizes in the puppy classes.

In the challenge class for deerhounds, Chieftain won, we think, correctly, and along with Mr. Joplin's other dogs was put up at auction, but was not disposed of owing to there being £200 reserve put on him by his owner. His kennel companion, Clansman, a very promising dog, won in the open class, and sold at auction afterward for £40, a really cheap dog at the price. Crofter, second prize, is a very promising young dog of fourteen months, and was in his right place. The bitches were only a moderate collection and correctly placed.

In greyhounds, dogs, first went to a white and lemon marked dog, Robbie Bell; he was claimed at his catalogue price, £30. The Messrs. Charles coming second and reserve with Balkis and Cassells. In bitches the winners are well known, Telegram III. rather fine, and Coral in bad condition.

In the class for foreign dogs, for which there was no separate class provided, we had a particular fancy for a dog called Dornovoy, described as a Russian wolfhound. He is sixteen months old, stands as high as any of our largest deerhounds, with good feet and legs, wonderfully good shoulder and neck, with good, deep chest and well-sprung ribs; he might be a trifle better in stifles; in coat he was neither smooth nor rough, and carried some feather on his tail; if he possessed a rough, wiry coat, he would come near our idea of an Irish wolfhound. However, he got nothing, which so far goes to prove that we are no judge of foreign dogs.

In the challenge class for pointer dogs first went to Milton Bang II., who has great bone and substance. Belhus Hector was absent. In the challenge class for bitches first went to Belle of Bow, bred by Mr. Price, the judge, owing to which we understand, he declined to decide between her and Mr. Norrish's Revel III., and the award was made by Mr. Shirley. In the open dog class we fancied Luck of Hessen, third, and Don IX., vhc. and reserve, equally as well as any in the class. In large sized bitches first went to Nymph, a good, well put together bitch with quality; second to Venus, a strong powerful bitch, also showing quality. In small dogs the winner, Naso of Kipping, is a good one and fit to hold his own in any company. Second to Osborn Ale, a black and white, not quite a high class show dog. Bracket, third, according to the catalogue is only six months old, date of birth being given as February, 1885. Milton Don, vhc. and reserve, is of good stamp, but rather coarse in head. The small bitches were a good class. The winner, a lemon and white, catalogued at £20, looks little money for a Palace winner.

The challenge class for English setter dogs had four entries, but only one put in an appearance, the lemon and white Sting. In the open dog class first went to the red and white Rock of Ages, a good dog full of go, yet we consider him very lucky to win in the company he was in. He was claimed at catalogue price, £52 10s. Second went to the blue belton Carlisle, a young dog by Sir Alister. But we much preferred the vhc. Count Howard to anything in the class; and we may say the third prize dog, Sir Tatton, is another good setter all through; on the small side, but a good one, and we preferred him as an English setter to either the winner or the second prize dog. The bitch class was a very large and good class, but we could not follow the judge in his awards, as we fancied some of the vhc. and others almost unnoticed as about the best.

In the challenge class of black and tan setters Czarina beat Young Jock, who is showing age. The open classes were better than we have been accustomed to lately, particularly the bitches, Heather Beauty being more fortunate here than at Warwick, where we thought her badly treated.

The challenge class for Irish setter dogs and bitches, two entries. Tyrone, first, is a very coarse-headed dog, too thick all through for an Irish setter. Mountaineer was of a better stamp yet not of the first water. In open dogs first went to Hector, a good well-made dog, good in color and coat, and of a better stamp than the champions. Second went to Frisco, looking well, in fact, better we think than we ever saw him; with age his color is much lighter, which was always his fault, and his face is not quite of the true Irish setter type. Lismore, third, is a good level-made dog, rather on the strong side to suit our ideas. Ulster Chief was of the proper type; in fact, at Dublin under Mr. Lort, he beat Hector. He is on the small side, but deserved more than he. In bitches, Aveline, first, is of good color and coat, but short of feather and plain in skull. Ruby VII. was the best to our mind. She was rather out of coat and had too much feather, which was rather light in color; she showed lack of grooming. Third, Kate Palmerston, from the same kennel, also required more attention paid to her toilet.

Wavy-coated retrievers were moderate when Mr. Shirley's team was taken away. They were entered not for competition and afterward sold by auction and brought from ten to fifty guineas each, except one, which was sold afterward privately at over fifty guineas. Curly retrievers were small classes. This variety seems going back.

Sheepdogs as a class were behind what we expected from the winter show and Warwick collection. In the champion dog class Dublin Scot beat Eclipse, and we consider correctly; in fact we think the winner the best all-round collie dog in England. Bye the bye, he is not in England at all; he is in Ireland. Madge I. had no opponent in the challenge class for bitches. In the open dog class first went to a small red sable, a very nice little dog, but not a red-hot one. We preferred Major Trefoil, third prize, who would do with a little more coat, but his head, ears and general style are good. The winner in bitches we consider won well, with Young Meg a good second. Next to these we fancied Marigold. In dog puppies Smuggler won. He has an immense coat, his face is short and ears carried badly, yet he won easily and changed hands. In the bitch class Mr. Arkwright won with a very handsome bitch, Blue Ruin. This bitch was fit for the open class. She very much resembles the same gentleman's Sky Blue, and although the color is not a very fashionable one, there is no mistake about the possessor of it being a true and typical collie. There was nothing to make a good second to her. There was only one bobtail sheepdog entered, a fairly good one.

In Basset hounds Fino V. beat Bourbon for the challenge prize, yet we think it must have been close running. Mr. Krehl won with Fino VI. in the open class, Mr. Blain coming second with a good one in Bertrand. There were four entries only in bitches, all very fair specimens. The third in open dog class won first in dog puppies, he is a large dog rather shelly, while the second prize one was very small and young and in bad health. The winner in bitch puppies is very promising and may be seen again on the show bench.

In Dalmatians Mr. Fawdry, as usual, won first and second, the others were nowhere.

In Pomeranians Old Charlie won first, not looking quite as well as we have seen him; he was the only white one shown. The second prize dog was a very pretty little black, not so heavy in coat as the winner.

Lyris won the challenge class for poodles. We understand the owner of Zulu lodged an objection against him on the ground of Lyris having been dyed. But from what we have heard it is 100 to one on Lyris coming away with a clear certificate. The open class for poodles was as good a collection as we have seen.

In the challenge class for large size bulldogs and bitches there was only one entry, Grabber, who was objected to as being in the wrong class. In the challenge class under 60 pounds, Black Prince was entered, but absent. In the challenge class for bitches under 50 pounds, Wheel of Fortune was a good first. In open dogs over 60 pounds and bitches over 50 pounds, President Garfield, second, is rather long before the eyes and a bit on the leggy side. Big Ben, vhc., well known, we fancied as about the best. In the next class Darkie, vhc., has a good skull. Rustic King won well. Jimmy Gripper, third, is a good white dog, but was out of condition. Next class, Mr. Adcock won with Acme, very closely pressed by Lady Stewart and Wild Rose. In small dogs, the winners were well placed. Julius Cæsar, hc., might have been further up, although he was out of condition. Small bitches were not so good a lot as the dogs. Mr. Sprague won both challenge cups with Grabber and Wheel of Fortune; but as Grabber was disqualified, owing to being entered in the wrong class, the challenge cup for best dog went to Rustic King.

There was the best collection of water spaniels we have seen for a long time, Mr. Skidmore showing a very good young dog, The O'Donoghue, who might just have won. However, first went to Young Hilda, looking her best, Lady winning third; but we really preferred Mickey Free, Lady being bad in shoulders and hollow in back.

In the challenge class for Clumbers, Boss III. won with no opponent. In the open dog class the first and third are large and rather high on the leg, while the second was rather light. The bitches were a very moderate lot; we missed the Duke of Portland's kennel.

In the challenge class for Sussex or liver-colored spaniels, the well-known Guy won. In the open class for dogs over twenty-five-pounds weight, the winners were a pair of promising young ones. In the corresponding bitch class the winners were too fine in face and of the stamp of blacks.

In the challenge class for other field spaniels there were four entries, and Squaw won correctly from Eastern Bruce and Beauty II. The open class for black dogs were a very moderate lot. Mr. Bryden won first and second in the class for black bitches. Sensation, vhc., was out of form. We think Thyra, hc., a good bitch. She should have been further up. In other-colored spaniel dogs, Mr. Jacob won with Newton Abbot Beau, well-known, and second went to a liver and tan from the same kennel. First and second in the following class seemed too fine in face; they were good-bodied and long.

In the challenge class for cockers, Obo, looking well, won. In the open dog class there were only two entries. The winner, a long and low puppy, more of the spaniel type, while second went to a dog more of the Obo type. Cocker bitches were a good class. First went to the pretty-colored Freda, Nellie VII. and Nellie IV. coming equal second. We consider the black, Nellie VII., the best type of cocker, but she is out at elbows.

In the fox-terrier challenge class for dogs, first and challenge cups were won by Result, looking well and winning easy. Brokenhurst Sting is light and wants substance. Belgravian seems going worse behind and his shoulders look coarser than usual. In the challenge class for bitches Meersbrook Model, looking well, won; we always liked this bitch. She is not fine enough in shoulders to please some, yet she is, in our opinion, a very level made bitch with a good terrier head and good coat with good feet and legs. Reckoner, winner in the open dog class and special cup for best in open classes, is a good terrier, not very taking on the first look, but when examined all through he is a good terrier and improves the more he is looked at. Beggerman, second, is another good terrier; he might be better in bone and his ears could be carried better. Dusky Joe, third, might be better in skull and have more bone, but he shows character. In the open class for bitches Belle Dame Sansmerci, third, is a very handsome bitch, bar her hindquarters. Safety, winner of first, is a nice bitch, we thought her correctly placed. Richmond Myrtle, second, by Raby Tyrant ex Richmond Olive, a very nice bitch, pressed the winner closely; she is good in size and a level-made one all over, looking better than when we saw her last. In dog puppies Tickham, second, is good in style, but rather thick and short in face. The majority of the other puppies were shown in the open classes.

Cavendish won in the challenge class for wire-haired. And there was a great deal of difference of opinion about him and Briggs; the latter is certainly not improving. Miss Miggs won easily in the corresponding bitch class. The open dog class introduced us to another good young dog in Carlisle Jack. He was well shown and is a good dog. We have an opinion that he will go a little coarse in shoulders. In open bitches first went to a very good young bitch, but we fancied the second prize winner, as being better in size, with a better set eye and finer and more level in face, but rather larger in ear. The second was also best in quarters and size. Mr. Redmond won most of all the produce prizes. There were only five entries in the two classes. Result won the 50-guinea challenge prize for the best smooth fox-terrier, and Carlisle Jack the one for the best wire-hair.

Cairo had no opponent in the challenge class for bull-terriers. In the open dog class first went to a large, good looking young dog, with rather too much drop below the eye, Silver King, well known, coming second. In large bitches there were only two entries, Queen of May winning easy. In dogs and bitches over 20 pounds and not exceeding 30, first went to a very nice bitch belonging to Mr. Pratt, claimed at £20; no doubt sold on account of her weight, being too large for the small class, yet too small to compete against large bitches. Merry Puss, vhc. and reserve, possesses a good head and eye. The small class under 20 pounds, contained a very level lot, the winners running each other close.

In Airedales we preferred the second and third to the winner in the dog class who is quite too thick in head. The bitches were better placed, yet the winner is coarse in head, but well made and best in color and coat.

The well-known Hairdresser won well in Bedlington terriers, with a very nice dog coming in second. In the bitch class the competition was very keen, and in such cases it is always a matter of opinion which way the winners are placed.

Irish terriers were a strong collection, no new ones except Bachelor, who is a good one and will go to the front if nothing happens him.

White English, as usual, were a small class and the winners well known.

Black and tans were a very poor class all through, with nothing worth particular notice.

Skye terriers were small classes but contained good quality, we consider the winning bitch, Missie, about the best, being very long and low with plenty of coat of a good hard color and texture.

In Scotch terriers Dundee was first, as usual, with a very good bitch of the same stamp, only not so good in shoulder covering second; Danara ought to have been noticed, perhaps his tail carriage was too much for the judge to recognize. We liked the second prize puppy, he is good in coat and type.

Dandie Dinmonts were a very good collection, and the awards were pretty well received. Border King won in the open class and beat Roderick for the special, and we quite agree with the award, considering Border King one of the best Dandies we have seen. He was shown in perfect condition. Were he just a little squarer in muzzle he would be a perfect Dandie.

In the challenge class for pugs Diamond, brother to Bradford Ruby, won, the latter holding the same position here last January. Duchess of Connaught beat Dowager in the corresponding bitch class. There were a few nice dogs shown in the open class. The bitches were also good, the winner a grand bitch, just dark enough in face and heavy in ears, but grand in skull and body. The winner at the Pug Dog Club show only got vhc. reserve. We thought her as good as any in the class. The second prize dog puppy promises well.

In Yorkshire terriers Lady Bective beat Conqueror, but we consider the latter far ahead. As usual, Lady Giffard had everything her own way in Maltese.

Bowsie beat Flossie II. in champion Blenheims. We prefer Flossie II. The open class was good, but there was nothing really striking in the class. King Charles were a good lot. Bend Or won, but was disqualified, as he ought to have been in the challenge class, so Young Jumbo got first, and Young Prince, third, was put up to second. As there were two hc. and no reserve given, we don't know what will come in for third prize or will the club keep it. In the smooth-haired toys there were some very nice black and tans shown. They were the best as a class that we have seen lately. There was a good collection of Yorkshires in the rough toys, many of which were merely entered for sale, and as usual the majority of them changed hands. During the show the weather was very favorable, yet the attendance seemed below the average.

[The list of awards will be found in the *American Kennel Register*.]

THAT TWO-LEGGED DOG.—Somerset, Pa.—Some weeks since I sent you an account of a "queer dog," without forelegs. I have been away from home since and recently returned. Meanwhile she has whelped five puppies, nice and lively they are; three living, for two bitches were drowned. Those remaining are like other dogs. The dam is hearty, and apparently thinks as much of her offspring as other mother-dogs. I have also learned that this curious creature is a cross between a full-bred rat-terrier bitch and an imported beagle which some gentleman had brought with him to the place. The question to me is, whence the long, woolly coat and the peculiar color? Both parents being full-bred, it seems that reversion to an ancestor is out of the question, unless we are to suppose the reversion to go far back among early progenitors of the canine race. Altogether this is one of the curiosities of nature, to me, at least.—AMATEUR.

THE IRISH WOLFHOUND.

[From the essay by Capt. G. A. Graham.—Continued.]

LITERATURE and the powers of depicting an animal in its correct form were in such a crude and immature stage among the nobility and gentry of the land at the periods when we have our first accounts of the Irish wolfdog, that it is not in the least to be wondered at that the imperfect descriptions given of the breed by such persons as were equal to the task were allowed to go uncontradicted by the only people in whose hands the breed was likely to be. From the accounts we have, however, we can clearly and distinctly gather that the dog has always been of greyhound shape, of gigantic stature and great power. In fact, such a dog as a cross between the Great Dane and present deerhound would produce, as to form and bulk, but of superior size.

Richardson, to further his views regarding the probable size of the ancient Irish wolfdog, tells us that certain canine skulls were found by Surgeon Wylde at Dimshanglin, which were concluded to be those of the Irish wolfdog; of these the largest was 11 inches in the bone, and from that fact he proceeds to argue that the living dog must have stood about 40 inches. To begin, he takes for his guide a deerhound dog standing 29 inches, whose head measures 10 inches. To the 11-inch Irish wolfhound skull he adds 3 inches for muzzle, hair, skin and other tissues, thereby making the head of the living dog 14 inches; thus getting the height of 40 inches from it, as compared to the 29 inches from the 10-inch head. Here, however, he would appear to be in error, as 1½ or 2 inches at the most would be enough to allow for tissues, etc., making the head 12½ to 13 inches only, and so reducing the height to 36 inches; moreover, the measurement of 10 inches for the head of a 29-inch deerhound is manifestly insufficient, as the writer can testify from ample experience. A deerhound of that height should have a head of at least 11 inches; so, calculating on the same principles, the skulls would have been from dogs standing about 34 inches. This skull is stated to have been superior in size to the others, so if the argument was of any real worth, we can only gather from it that the dogs would have ranged from 31 to 34 inches in height, which is probable enough.

From the general tenor of the accounts we have of this dog's dimensions and appearance, it is certainly to be gathered that he was of considerably greater stature that any known race of dogs now existing, and apparently more than equal to the destruction of a wolf.

It is an incontestable fact that the domestic dog, when used for the pursuit of ferocious animals, should be larger and apparently more powerful than his quarry if he is expected to take and overcome him single-handed, as the fierce nature, roving habits and food of the wild animal render him more than a match for his domesticated enemy, if of only equal size and stature. We know that the Russian wolfhounds (certainly very soft-hearted dogs), though equal in stature to the wolf, will not attack him single-handed—and wisely, too, for they would certainly be worsted in the combat. The Irish wolfdog, being used for both the capture and despatch of the wolf, would necessarily have been of greyhound conformation, besides being of enormous power. When caught, a heavy dog, such as a mastiff, would be equal to the destruction of a wolf, but to obtain a dog with greyhound speed and the strength of the mastiff, it stands to reason that his stature should considerably exceed that of the mastiff—one of our tallest as well as most powerful breeds. The usual height of the mastiff is 30 inches; and arguing as above, we may reasonably conclude that to obtain the requisite combination of speed and power, a height of at least 38 inches would have been reached, though we are told by several writers that he exceeded that height considerably, as will have been seen.

The subject of Irish wolfhounds was revived in the New York *Country* in 1878, and some interesting facts were related by Mrs. Fremont, regarding two dogs of this breed that had been imported to Fort Snelling—as a present to a Mr. Sibley—from England about 1838. They appear to have been of a brindle color, and were much larger and heavier than the deerhound, while equally quick in their motions; the coat described as short-haired. Others have been seen at intervals in the United States.

In a subsequent article on the same subject in the New York *Country* it is written: "It is absurd to give as a reason for the indifference and apathy through which such a breed has been allowed to die out or its perpetuity to be endangered, that in the extermination of his particular foe—the wolf—his occupation was gone. A noble animal of this character should never have been permitted to waste away while curs of the lowest degree are petted and pampered and carefully provided for. In this country particularly the Irish wolfdog could be made of special service. Here he would find in the chase and extermination of the wolf a wide field for his prowess and courage. On the western bounds of civilization he would be invaluable for the purpose of hunting, his keen sight and scent rendering him superior to many breeds now in use, and as a companion and friend of man his fidelity and devotion have never been called in question. All the testimony which comes down to us agrees as to his sagacity, courage, strength, speed and size, although in this last point we perceive there is a difference of opinion. Even allowing that he attained a height of from thirty-two to thirty-five inches, he is taller than any breed now living, although the early accounts published of him state he was from three to four feet high."

It has been suggested by a gentleman well known as a great fancier of dogs that the dog in use in Spain for taking wolves is identical with the old Irish wolfdog; but the specimen brought over from Spain by him would at once undeceive us, as he is, to all appearance, a Great Dane of light stamp—possibly crossed with the wolfdog of the Pyrenees.

For many months past a spirited controversy and correspondence on the Irish wolfhound has been carried on in the *Live Stock Journal*—a well-known weekly publication—by the writer and others, without, it is confidently thought, in any way disturbing the conclusions on the breed which the writer has, from careful and prolonged consideration of the subject, arrived at and will be set forth presently.

The question as to whether it is desirable to continue and thoroughly resuscitate this superb breed now that his occupation is gone is hardly worth entertaining.

The mastiff and bulldog, though no longer used to bait bear and bull, abound in thousands and in a far more perfect form than they were a hundred years ago. The bloodhound's original use has disappeared, yet who would wish to see these noble hounds die out?

Have not a dozen breeds—such as St. Bernards, collies, etc.—been taken up, cherished, and improved to a marvellous degree? Why not, then, take such measures to recover the Irish wolfdog in its original form? It can be done; the means are at hand if the will be only forthcoming. From the materials forthcoming in such specimens of the breed as are extant and the largest deerhounds, with judicious crosses for size and power, there is little doubt that the breed can be restored to us in much of its original magnificence, and the noble canine giant—always held to be typical of Erin—would be worthily and faithfully represented.

It reflects but small credit on the gentlemen of Ireland that this breed—the national representative dog of their country—should have been allowed to dwindle down to a shadow of its former self. Mastiff breeders with much care and judgment have rescued England's national dog from a very degenerate state, and from most indifferent materials, and restored him in a form quite equal, if not superior, to what he was at his best. Why, then, should not the same be done for their most superb national dog by Irishmen? Let them look at this, put their shoulders to the wheel, and success will surely crown their endeavors.

As the deerhound of the present day is to the ordinary greyhound, so is the giant Irish wolfhound to the deerhound. An Irish paper, waxing enthusiastic on the subject, says, not

long ago, regarding the Irish wolfdog: "This animal has become celebrated as the heraldic protector of our country. Fair Erin sits pensively beside her harp, the round tower stands near, and guarding all three, reclines the wolfhound. Scotland's lions have been famed in story; England 'stole' one of them, say some, and joining him in company with the unicorn, committed to his trust the honor of Albion; but the unicorn is a beast which even Dr. Haughton has never seen, while we must go to the antediluvian era to find lions in Great Britain. But the wolfdog is no mythic beast in Ireland; he was and we trust will again be included among the undoubted, exclusive, and most distinguished specimens of the Irish fauna."

In the British Museum there is a Grecian vase, some 450 B. C., on which Acæon is depicted surrounded by his dogs. Some of them would appear identical with what the Irish wolfhound was, save, perhaps, in the matter of coat.

On some ancient frescoes at Easton Neston Hall, near Towcester, are depicted various hunting scenes. In one of these two vast dogs of deerhound type are represented as seizing a boar, and these frescoes having been painted at a time when the Irish wolfhound existed, may be looked upon as throwing considerable light on the real type of that breed. They are shown to be vast deerhounds, with rough wiry coats, of a dark blue-gray color, ears small and falling over.

It will have been noticed that several persons owning Irish wolfhounds in former days were in the habit of styling them "the last of their race." It appears tolerably certain that the breed was gradually being merged into the present breed of deerhounds, and each successive owner was jealously claiming for his specimen the honor of being the last.

It will be well now to state the conclusions at which the writer has arrived as to the general appearance and character of the Irish wolfhound, after a prolonged, searching, and careful study of the subject.

Form.—That of a very tall, heavy, Scotch deerhound, much more active, and very majestic-looking; active and fast, perhaps somewhat less so than the present breed of deerhound; neck thick in comparison to his form, and very muscular; body and frame lengthy.

Head.—Long, but not narrow, coming to a comparative point toward the nose; nose rather large, and head gradually getting broader from the same, evenly up to the back of the skull—not sharp up to the eyes, and then suddenly broad and lumpy, as is often the case with dogs bred between greyhound and mastiff.

Coat.—There can be little doubt that from the very nature of the work the dog was called upon to do this would be of a rough, and probably somewhat shaggy nature, and to this end points the evidence gained from Arian—second century—who leaves no doubt in our mind that the great greyhound of his day was rough in coat; also from the ancient Irish harp, now preserved in Trinity College, Dublin, which is ornamented with a figure of the Irish wolfhound, rough-coated. Sir J. Browne's dogs were rough and shaggy; Mr. O'Toole's dog was rough; also Hamilton Rowan's. The former Earls of Caledon owned Irish wolfdogs, which were rough; added to which, in former days all greyhounds were, we have every reason to believe, rough; certainly the larger variety, as is now without exception the case. So it is with justice concluded that the coat was thoroughly rough; hard and long all over the body, head, legs, and tail; hair on head long, and rather softer than that on body, standing out boldly over eyes; beard or under jaws being also very marked and wiry.

Color.—Black, gray, brindle, red and fawn, though white dogs were esteemed in former times, as is several times shown us—indeed they were often preferred—but for beauty the dark colors should be cultivated.

Ears.—Small in proportion to size of head, and half erect as in smooth greyhound. If dark in color it is to be preferred.

The Tail should be carried with an upward curve only, and not be curled, as is the case with many greyhounds.

Size.—It will be seen that the deerhound dog had considerable trouble in despatching the she-wolf, as narrated before, she being his inferior in size; so putting the matter on the grounds of simple necessity, we cannot but conclude that the dog should be less than from two to three inches taller than the wolf. Now, the usual height of the wolf would range about 30 inches, therefore we get the height of from 32 to 33 inches in the dog. Also arguing from the skulls, the dog would have stood 32 to 34 inches. We may, therefore, safely deduce that the height of these dogs varied from 32 to 34 inches, and even 35 inches in the dogs, probably from 29 to 31 inches in the bitches. The other dimensions would naturally be about as follows for well-shaped and true-formed dogs. Girth of chest—Dogs, 38 to 44 inches; bitches, 32 to 34 inches. Weight in pounds—Dogs, 115 to 140; bitches, 90 to 115. Girth of forearm—Dogs, 10 to 12 inches; bitches, 8½ to 10 inches. Length of head—Dogs, 12½ to 14 inches; bitches, 11 to 12 inches. Most modern authors and all practical lovers of the canine race whom the writer has consulted are agreed that the foregoing is the correct type of dog beyond question; and although some differ slightly as to the comparative bulk and power of the dog, the difference is small when dispassionately looked at.

To any one who has well considered the subject such conclusions are inevitable, and this impression has been manifestly handed down to us for generations.

It is much so be deplored that this superb and valuable breed of dog has been allowed to fall into such a neglected and degenerate state, presumably owing to the fact of the wolf having become extinct, and consequent less care on the part of the owners in keeping the breed up to its proper form.

Although several writers have incorrectly confounded the Great Dane with the Irish wolfhound, yet it is probable that the two breeds were not infrequently crossed; indeed, it is possible that in foreign countries the Irish wolfhound may have degenerated into the Great Dane and other varieties, as it has into the deerhound with us. That such was the case Buffon does more than suggest. Major Garnier, who gave the subject considerable attention at one time, rather holds to this opinion, and says "that while the Highland deerhound is the most correct type, the German boarhound has best retained the size, though at the expense of character."

These facts may possibly have influenced erroneously the opinions of some of the naturalists of the latter end of the last century, and will also account for the fact of Lord Altamont's dogs having been put forward as Irish wolfhounds, which they certainly were not.

The last wolf was supposed to have been killed in Ireland about 1710. Sir Walter Scott was in the habit of calling his dog Maida a wolfhound, and on the death of that dog he was presented by Glengarry and Cluny MacPherson with a brace of dogs of the same character, and said: "There is no occupation for them, as there is only one wolf near, and that is confined in a menagerie." They were both animals of gigantic size. Scott was also offered a fine Irish wolfdog by Miss Edgeworth, but declined it, having the others.

Richardson says: "Though I have separated the Irish wolfdog from the Highland deerhound and the Scottish greyhound, I have only done so partly in conformity with general opinion, that I have yet to correct, and partly because these dogs, though originally identical, are now unquestionably distinct in many particulars."

The former Earls of Caledon at one time owned a breed of Irish wolfhounds, regarding which the present peer has obligingly collected the following particulars: "The dog was in appearance between a mastiff and deerhound; slighter and more active than the one, more massive and stronger than the other; as tall or taller than the tallest deerhound; rough but not long-coated; fawn, grizzly, and dun in color; some old men on the property have mentioned a mixture of white."

It is believed that the late Lord Caledon took two of these wolfdogs with him to the backwoods of America.

The impression of a seal belonging to the Caledon family has on it the figure of a wolfhound which shows the tail carried with a curve upward, as depicted in Reinagle's portrait.

A breed was also owned by the Lords O'Neil, also by Lord Castletown; but no information regarding them has been obtained, although a friend of the writer was presented, many years ago, with a bitch of the former breed which answered very much to the description given above of Lord Caledon's dogs.

The late Sir John Power, of Kilfane, Thomastown (whose dogs will be alluded to presently), was a personal friend of the writer, and knew Richardson well, and has many times affirmed that Richardson always considered the Irish wolfhound to have been a gigantic deerhound of enormous power.

In a very interesting letter from an American gentleman, written to a gentleman residing in England, published in the *Live Stock Journal* some months ago, he says: "I have felt an interest in the subject for over fifty years. My father often spoke of Lord Sligo's (Altamont's) breed of dogs, and doubted their being the genuine Irish wolfdog. He had every opportunity of observing them himself, being much at Westport House during his youth." After making other observations, he goes on to say: "The bone of the foreleg is, I should say, the point that best distinguishes dogs of this class from all of the greyhound class, whom in actual build they so much resemble. The massiveness of the bone is out of proportion altogether, and it certainly was not made for speed so much as for power and endurance. I think all the Scotch dogs that I have seen are deficient in this respect, and I attribute it to crossing with lighter-built breeds in order to obtain swiftness for deer hunting. The epithet 'hairy-footed' in old Irish poems leaves no doubt as to the comparatively rough coat of the Irish wolfdog."

That it is beyond reason that any dog should have stood 36 inches is not the case, as Lord Mount Edgecombe has a picture of a dog taken life-size which measures 36 inches to the shoulder. The skeleton of this dog (apparently a Great Dane), which is also preserved, would corroborate this measurement. A picture was also painted for the Marquis of Hastings in 1803, by Clifford de Tomson, which represents a dog standing 36 inches at the shoulder—also apparently a Great Dane, of a buff and white color. The picture measures 7¼ feet by 5½ feet, so it will be seen the dog must of necessity have been gigantic. We have also had some enormous dogs "in the life" of late years. The great American dog exhibited to Her Majesty some eighteen years ago was said to stand 39 inches. Sir Roger Palmer's Sam was 34. Both were boarhounds. Several of our mastiffs have stood 33 and even 34 inches. The great dog brought from America by Mr. Butler, of New York, about four or five years ago, stood about the same height. He was a descendant of the dog shown to the Queen—also owned by Mr. Butler. On the Continent it is not uncommon to find dogs standing 33 and 34 inches, and a boarhound has been brought to the writer's notice, belonging to a gentleman residing at Cologne, that was reported to stand 37 inches by a gentleman well accustomed to large dogs.

The tallest dog the writer has actually measured stood 34½ inches on the shoulderblade—a giant indeed. With all these examples before us, and some of them within our reach, there is no reason why the Irish wolfhound should not be restored to its original height of from 33 to 35 inches.

It is worthy of remark that while some people scout the very idea that the deerhound is the descendant of the Irish wolfhound, McNeill is proud to claim such descent for his favorite breed.

The assertion that has been frequently made by writers on the breed that he stood 4 feet high no doubt applied to the top of his head, as a 33 or 34-inch dog would stand nearly 4 feet at that part.

A friend of the writer's—a deerhound breeder of considerable experience, and one who had well considered the Irish wolfhound question—writes:—"I hold that the Irish wolfhound was identical with the Scotch deerhound, only even more massive and bigger still. Ireland seems to have been peculiar for the growth of big animals as well as big men. Look at the fossil elk for instance. I have a pair of antlers in my hall—I believe the longest in existence—11 feet in a straight line across from tip to tip."

Major Garnier at one time turned his attention to Irish wolfhounds, and produced one or two dogs of great size, but he was unable to carry his projects to an end, being suddenly ordered to the Cape.

He was thoroughly convinced that the recovery of this breed in its pristine grandeur and magnificence was only a question of time if the would-be breeders were steadfast in their endeavors. He had laid down for himself certain rules in breeding, which are given:

"1. Quality is very much more dependent on the dam than on the sire.

"2. Bone or size, on the contrary, is far more dependent on the sire.

"3. Color is almost wholly dependent on the sire.

"4. The coat is almost wholly independent of the sire.

"5. Muscular development and general form is chiefly dependent on the dam.

"6. All these are modified by the fact that the purer bred will (other things being the same) influence the progeny more than the other.

"7. Every decided cross increases the size by one or two inches. This is merely an opinion formed from my own experience and observation; but I have never seen it carried out far enough to make me certain in my own mind about it.

"1, 2, 3, 4 and 5 I have not merely met with as the opinions of other people, but I have proved them incontestably myself. With regard to No. 1—'quality'—I mean 'blood,' nervous development, vigor, energy and character."

He then goes on to give many valuable facts and hints on breeding Irish wolfhounds and other dogs, too long to insert here. He concludes by saying: "Anyhow, with Ulmer boarhounds and Russian wolfhounds (of course, in conjunction with the deerhound and such of the Irish breed as are in existence) I believe it is quite possible to re-establish the old breed of Irish greyhounds in all their former beauty and power. I should, however, be content with perfection of form and coat at 34 inches."

The writer is not prepared to coincide entirely with the above rules, but in the main he considers them correct, and such as can safely be adopted by breeders. It may be as well to remark that no two dogs of the first cross should be mated together, as the produce will be certain to be most degenerate. The foxhound, the pointer, the shorthorn, and many breeds of sheep and pigs, have been brought to their present excellence by judicious crossing; why should not the same principle be applied to the perfecting of the Irish wolfhound? Too much in-and-in-breeding should be especially avoided, as size is thereby eventually lost to an alarming degree, even though character be retained.

[TO BE CONCLUDED.]

THE MILWAUKEE DOG SHOW.—*Editor Forest and Stream:* The prospects for this exhibition seem to grow brighter every day, judging from the very lively interest manifested for its success, by a large number of distant, as well as local admirers of the dog. We are progressing finely with the special prize list, and our able manager, Mr. F. D. Olcott, is in daily receipt of letters on the subject from all parts of the country. Major J. M. Taylor, of Lexington, Ky., is to judge the setters and pointers, and Mr. J. F. Kirk, of Toronto, the remaining classes. Through mistake, the King Charles spaniel class was omitted from the prize list, and the error is now corrected by offering a $25 special for the best dog or bitch of that class. Copies of the premium list will be supplied to applicants by addressing J. D. Olcott, 169 and 171 West Water street, Milwaukee, Wis.—MUSKEEGO (Milwaukee, Wis.)

THE GREYHOUND STANDARD.—*Editor Forest and Stream:* Will owners and breeders of this breed send their views of what an English greyhound should be to H. W. Smith, Box 876, Worcester, Mass., for the greyhound standard committee?—H. W. SMITH.

KENNEL NOTES.

NOTICE TO CORRESPONDENTS.

Kennel notes are inserted in this column free of charge. To insure publication of notes, correspondents MUST GIVE the following particulars of *each animal:*

1. Color.
2. Breed.
3. Sex.
4. Age, or
5. Date of birth, of breeding or of death
6. Name and residence of owner buyer or seller.
7. Sire, with his sire and dam.
8. Owner of sire.
9. Dam, with her sire and dam.
10. Owner of dam.

All names must be *plainly* written. Communication on one side of paper only, and signed with writer's name.

NAMES CLAIMED.

☞ *See instructions at head of this column.*

Swatara, Paxtang, Codorus, Fatalist and Fatality. By F. W. Seiler, Harrisburg, Pa., for English setters, a black, white and tan dog, a liver, white and tan dog, two lemon and white dogs, and a black, white and tan bitch, whelped May 9, 1885, by Count Noble out of his Fate Gladstone (Gladstone—Sue).

Pet. By W. E. Deane, Somerset, Mass., for black, white and tan beagle bitch, whelped May 29, 1883, by Racer (Rally—Lill) out of Vic (Darwin—Lady).

Courtney, Bryn Mawr, Dunbar, Opera Bouffe, Wissahickon, My Queen, Miss Longley, Rosemouth, Delbeck and Lady T. By J. H. Winslow, Philadelphia, Pa., for liver and white pointers, five dogs and five bitches, whelped June 20, 1885, by G. F. Jordan's imported Nip (Pulkington's Luke—Duke of Portland's Juno) out of his Viola (A.K.R. 703).

Lady F. By Dr. W. F. Footaine, Worcester, Mass., for liver and white pointer bitch, whelped June 10, 1882, by King (Leo—Loo) out of Say (King—Jet).

Stormer II., Lightfoot, Fleetfoot, Spinaway and Dalliance II. By Half-Way Brook Kennels, Glens Falls, N. Y., for black, white and tan foxhounds, four dogs and one bitch, whelped July 7, 1885, by imported Stormer (A.K.R. 2402) out of imported Dalliance (A.K.R. 2400).

Brunswick, Cardinal, Marlborough, Berneta, Bernaline and Hermita. By Essex Kennels, Andover, Mass., for mastiffs, three dogs and three bitches, whelped July 20, 1885, by champion Hermit (A.K.R. 23) out of Daphne II. (A.K.R. 489).

Leda. By Victor M. Halderman, General Wayne, Pa., for liver and white pointer bitch, whelped Jan. 31, 1885, by Jimmie (A.K.R. 1589) out of Temptation (A.K.R. 1590).

Glendale Chief and Glendale Beauty. By Half-Way Brook Kennels, Glens Falls, N. Y., for blue, tan and white foxhounds, dog and bitch, whelped July 7, 1885, by imported Stormer (A.K.R. 2402) out of imported Dalliance (A.K.R. 2400).

Bob H. and Caw Caw. By Dr. Robert I. Hampton, Athens, Ga., for black and white English setter dog and blue belton and tan bitch, whelped March 31, 1885, by Count Noble out of Belle Boyd (A.K.R. 1277).

Chestnut Rock Kennels. By Chas. S. Fitch, Fort Washington, New York city, for his kennels of Gordon and black and tan setters.

NAMES CHANGED.

☞ *See instructions at head of this column.*

Nashie to Constance. Beagle bitch, whelped May 23, 1882 (Ringwood—Norah), owned by Half-Way Brook Kennels, Glens Falls, N.Y.

BRED.

☞ *See instructions at head of this column.*

Lady Bess—Chief. J. A. Cathcart's (Atlantic City, N. J.) red Irish setter bitch Lady Bess (A.K.R. 2178) to Max Wenzel's Chief (A.K.R. 231), July 14.

Domio—Gus Bondhu. Sagadahoc Kennels' (Bath, Me.) English setter bitch Domio (Royal Blue—Dryad) to A. M. Tucker's Gus Bondhu (Dashing Bondhu—Novel), June 13.

Una—Bannerman. Dr. E. B. Weston's (Highland Park, Ill.) beagle bitch Una (A.K.R. 1324) to A. C. Krueger's Bannerman (A.K.R. 1709), June 8.

Toodles—Tuck. George W. Dixon's (Worcester, Mass.) pug bitch Toodles (A.K.R. 2147) to C. H. Amsden's Tuck (champion Comedy—Lady), July 8.

Lizzie Grace—Duke Royal A. A. Raymond's (South Norwalk, Conn.) pointer bitch Lizzie Grace (A.K.R. 2476) to his Duke Royal (A.K.R. 2472), June 1.

Olive K.—Harold. California Kennels' (Sacramento, Cal.) English setter bitch Olive K. (Rake—Bessie Lee) to their Harold (Gath—Gem), July 15.

Constance—Joe. Half-Way Brook Kennels' (Glens Falls, N. Y.) beagle bitch Constance (Ringwood—Norah), to C. W. Willard's Joe (Ringwood—Gipsey Queen), June 10.

ZONA, NOT ZOZO.—*Editor Forest and Stream:* In your issue of the 23d inst you published a notice about my bitch being bred to Obo, Jr. Her name is Zona instead of Zozo, as you have it.—WM. H. MOSELEY (New Haven, Conn.). [Mr. Moseley's letter of July 10 gives the A. K. R. number of Zona as 2380, which is the number of Zozo. As the name was not very plainly written, we referred to A. K. R. and published the name that the number called for. The number of Zona is 1881. Had this been given there would have been no mistake. Moral—Write plainly and make no mistakes; but if your pen does slip, charge it to the editor.]

WHELPS.

☞ *See instructions at head of this column.*

Sheila. L. Timpson's (Red Hook, N. Y.) Irish terrier bitch Sheila (A.K.R. 137), July 3, five (two dogs), by J. Coleman Drayton's Slasher (Fury—Spuds).

Viola. J. H. Winslow's (Philadelphia, Pa.) pointer bitch Viola (A.K.R. 703), June 20, eleven (six dogs), by G. F. Jordan's imported Nip (Lake—Juno).

Nell. Chas. S. Fitch's (New York) Gordon setter bitch Nell, July 14, one dog (since dead), by Dan O'Shea's Jack.

Peggie. George Gillivan's (West Jefferson, O.) pug bitch Peggie (A.K.R. 1804), July 24, five bitches, by Chas. Leonhard's Treasure (A.K.R. 472).

Yolande. W. H. Tuck's (Wilkesbarre, Pa.) cocker spaniel bitch Yolande (A.K.R. 523), July 2, eight, by Obo II. (A.K.R. 432); two dogs and two bitches since dead.

Bird. Maple Kennels' (Patterson, N. Y.) pointer bitch Bird (A.K.R. 1658), July 17, eleven (five dogs), by Friz (A.K.R. 268); six lemon and white and five liver and white.

Daphne II. Essex Kennels' (Andover, Mass.) St. Bernard bitch Daphne II. (A.K.R. 489), July 30, eleven (six dogs), by champion Hermit (A.K.R. 23); three dogs and two bitches since dead.

Critic. W. O. Partridge's (Boston, Mass.) black spaniel bitch Critic (A.K.R. 303), July 10, eight (one dog), by J. P. Willey's champion Obo II. (A.K.R. 432).

Janet. California Kennels' (Sacramento, Cal.) English setter bitch Janet (Count Noble—Dashing Novice), July 17, seven (four dogs), by Dashing Mouey (Dashing Monarch—Armida).

Suwanee. A. Clinton Wilmerding's (New York) cocker spaniel bitch Suwanee (A.K.R. 658), July 15, six (three dogs), by Dr. Chas. McBurney's champion Sport; four black, and two black with white markings.

Marion. A. Clinton Wilmerding's (New York) spaniel bitch Marion (Brag—Princess), July 21, seven (one dog), by his black Prince (A.K.R. 62); six black, one black, with white belly.

Flora. H. Reiche's (New York) cocker spaniel bitch Flora (Flake—Lady), May 22, nine (three dogs and three bitches living), by A. Clinton Wilmerding's Black Prince (A.K.R. 62); two black and four liver and white.

Skip. Geo. F. Reid's (Barton, Vt.) beagle bitch Skip (A.K.R. 1997), July 11, eight (four dogs), by W. Miles's Flute M.

SALES.

☞ *See instructions at head of this column.*

Butterfly. Liver and white pointer bitch, whelped Nov. 20, 1884 (Fritz—Bird), by Maple Kennels, Patterson, N. Y., to N. Watson, New York.

Kitty Wells Black, lemon and white pointer bitch (A.K.R. 1043), by Maple Kennels, Patterson, N. Y., to C. T. Knight, Providence, R. I.

Moya. Irish terrier bitch (A.K.R. 2385), by L. Timpson, Red Hook, N. Y., to L. A. Shaw, Newton Centre, Mass.

Dora. Liver and white cocker spaniel bitch, whelped Aug. 16, 1879 (Captain—Flora), by W. J. Furness, Ogdensburg, N. Y., to L. O. Bowley, Richardson, Me.

Alice Obo. Black cocker spaniel bitch, whelped April 30, 1885 (Obo II.—Phonsie), by J. P. Willey, Salmon Falls, N. H., to W. H. Tuck, Wilkesbarre, Pa.

Sport. Lemon and white pointer dog, whelped Jan 28, 1885 (Fritz—Bird), by Maple Kennels, Patterson, N. Y., to Jas. Reynolds, Poughkeepsie, N. Y.

Count Noble—Belle Boyd (A.K.R. 1277) whelps. English setters, whelped March 31, 1885, by Dr. R. I. Hampton, Athens, Ga., a black, white and tan dog to Geo. T. Hodgson, an orange belton and tan dog to Dr. John Gerdine, same place, and a blue belton and tan bitch to Prof. R. M. McIntosh, Oxford, Ga.

Marie Obo. Black cocker spaniel bitch, whelped Nov. 19, 1884 (Obo II.—Gem), by Geo. L. V. Tyler, West Newton, Mass., to C. G. Browning, Worcester, Mass.

Pilot. Lemon and white pointer dog, 4½yrs, old (Scout—Spot), by C. W. Littlejohn, Leesburg, Va., to Chicago Kennels, Chicago, Ill.

Nashie. Beagle bitch, whelped May 23, 1882 (Ringwood—Norah), by C. F. Kent, Monticello, N. Y., to Half-Way Brook Kennels, Glens Falls, N. Y.

PRESENTATIONS.

☞ *See instructions at head of this column.*

Count Noble—Belle Boyd (A.K.R. 1277) whelp. Black and white English setter dog, whelped March 31, 1885, by Dr. Robt. I. Hampton, Athens, Ga., to Hon. A. J. Crovatt, Brunswick, Ga.

Rex—Edith whelps. Cocker spaniels, whelped May 23, 1885, by Sagadahoc Kennels, Bath, Me., a liver dog to Nathaniel E. Story, Charlestown, Mass., and a black and white bitch to Andrew L. Cone, Portland, Me.

KENNEL MANAGEMENT.

☞ **No Notice Taken of Anonymous Correspondents.**

C. R., Pleasantville.—A setter, when working hard, seems to be winded, breathing heavily, blows, nearly chokes, and has to stop. Do not know whether it is in lungs or throat. A setter bitch had puppies about six weeks ago; took puppies off two weeks ago. Mammary glands badly swollen and very hard. Ans. We should say that your setter dog has asthma. We would advise you to diet your dog and bring him down in flesh if he is fat. If he is thin, tonic treatment, such as two grains of reduced iron twice daily in pill form, should be given. If he is constipated his bowels should be regulated with syrup of buckthorn in dessertspoonful doses twice daily. If the paroxysms of choking are severe or frequent, we would advise putting the dog in a close room, and burning stramonium leaves once every two days for fifteen minutes, the fumes of which he should breathe. The bitch should be poulticed with flaxseed.

Rifle and Trap Shooting.

Address all communications to the Forest and Stream Publishing Co.

INTER-TEAM CONTESTS.

Editor Forest and Stream:

Since the article entitled "Inter-Team Contests" appeared, June 4, in your columns, I have received several letters from secretaries of local clubs in reference to the subject. While all seem very much interested in the project, there are many objections to the proposed arrangements, some of them, I think, well founded.

Foremost among the objections appeared the number of ten men to constitute a team. I think this objection is not well founded. One of the foremost objects of associating these clubs is to increase an interest, not only in the improvement of those who are already members of such organizations, but to build up our depleted membership, bring out new men, and develop good marksmen. Let every member feel a lively interest in building up the club as well as improving his individual score. The club of which I am a member cannot muster more than six or seven reliable shots, and two of them use and have always used a light pull, set lock or hair trigger, whatever they are called.

The next objection seems to be, "No restriction as to weight of gun, style of sights or pull of trigger." Some wish the gun to be "within the National rules." This objection I concede is well founded; inasmuch as it is an indisputable fact that such a weapon is the only practical one, should a man wish to bring to practical account his skill with the rifle in the field, either in times of peace or war. Personally I should prefer that the gun should be within the National rules, yet I am aware that under the requirement of a three-pound pull many clubs would lose some of their best marksmen so far as these contests are concerned, as I know these light-pull men have to be in many cases inseparably wedded to the set lock. Evidently a gun of greater weight than ten pounds is not desirable, to the majority at least, and it might be well to restrict. Personally I should be willing to shoot even-handed with any man who wished to shoot with a gun of greater weight "off hand." I understand that "off-hand" is defined: Position standing, without artificial rest (either to the body or the gun). I think there was no objection to "any sights." The only objection to the target seems to be the fact that various clubs are accustomed to certain others, and do not wish to change unless some other target should come into universal use.

In answer to this I have to say that the American decimal was mentioned as being the one best adapted for the purpose, it being one that would definitely record the merits of the marksman, and at the same time be convenient to transport to headquarters by mail. Should some think it too small for convenient sighting field, there should be no objection to placing it upon a white back ground. The bullseye being the same, and the largest ring equal to the Creedmoor four count it would be easy to record equivalents in the Creedmoor and some other targets.

I think I have answered all the objections of importance. Evidently we should use a uniform target, and my private opinion is that a shot which would miss the four count of the Creedmoor and score a miss by the American decimal is not worthy a record. I do not wish to prescribe rules, but, with others, consider them, and get the ball moving in the right direction, with plenty of powder behind it. Let every club interested declare itself in regard to these three principal points, and I think the minor details can be arrived at with little trouble.

If the secretaries of the various clubs will send me their views and suggestions regarding these points, and any others that they may think fit, I will endeavor, with the assistance of members of the Chautauqua Sportsmen's Association, to submit for their approval a set of rules which shall be in accord with the majority as expressed.

JAMESTOWN, N. Y. SERENO N. AYRES.

RANGE AND GALLERY.

BROOKLYN.—Friday evening, July 24, a return match was shot in the Fourteenth Regiment armory between five men of Company A, Twenty-third Regiment, and five of Company I, Fourteenth Regiment. The latter were again the winners by the following score:

Company I, Fourteenth Regiment.

SPRINGFIELD, Mass.—The Rod and Gun Rifle Club had a prize shoot Saturday afternoon, in addition to the regular week shoot for the monthly medal. Two thunderstorms interfered with the shooting and lost a great part of the afternoon. The Beaver River badge was won for the second time by T. B. Wilson. The scores were:

Beaver River Badge.

T B Wilson	11	10	11	12	9	9	12	11	12	12	12	10	—109

F C Douglass	11	6	7	10	5	6	6	9	7	9	— 74		

The prizes for the above were given by merchants of the city.

A continuous rest match was shot. The prizes being taken by A. Lamont 114, Z. C. Talbot 112, S. K. Hindley 108. T. B. Wilson holds the first class badge for the month with the score of 105. T. T. Cartwright the second class, score 90.—APERATURE.

WIMBLEDON, July 22.—The shooting at Wimbledon in the contest for the Kolapore Cup has been finished. The English team won with a score of 650. The next best scores were: Guernsey team 639, Jersey team 612, and Canadian team 597. A very troublesome mirage seriously crippled the Canadians, who were not accustomed to such atmospheric phenomena. The prize list has undergone several and important alterations. The Queen's Prizeman will, as heretofore, take the gold medal, gold badge, and substantial amount of £250. Beyond this alteration the other great prizes remain almost substantially the same as heretofore, though in several cases the number and value of the awards have been increased. For the Kolapore Cup the home team have an extra incentive of £24, if they are successful, and, on the other hand, both Guernsey and Jersey have been allowed to enter teams as Colonies. Several prizes of minor importance disappear altogether from the programme, and others take their place. Of these the most novel is the "Hanke Prize," presented by Mr. Ellis Parr. This will be fired for at 200yds. at a target, colored scarlet, representing the head and body of a man, on which an invisible bullseye and center will be drawn. The marksmen will be allowed seven shots, the figure appearing and disappearing alternately for five seconds. Other contests under novel conditions include the revolver prizes, for which an elaborately screened range has been prepared. Most of the series of prizes, especially for aggregates, have been increased, while there are several new contests thrown open to all comers. In the Ashburton Challenge Shield and kindred contests the expression of opinion that the use of carbine ammunition should not be enforced has been recognized, and the contestants are to be allowed to use either that or the full regulation cartridge. The pull of trigger for the "M.B.L." has been lowered from six to five pounds, while at the same time that that for "any rifles" has been raised from three to five. For the first time in the annals of Wimbledon the winner of the "grand aggregate" will be recognized by the addition of "G. C." to his name, while the next man to him will have the addendum of "S. C."

BOSTON, July 25.—Vacation and warm weather made the attendance limited at Walnut Hill to-day. The weather was good with the exception of the heat. Some practice was had at 500yds., but no scores were finished at that distance. On Saturday, the 18th, a telegraph match was shot with the Empire Rifle Club of Thomaston, Conn., 8 men, 15 rounds, resulting in a victory for the M. R. A. team of 28 points over the Empire Club Team. The detailed scores are given below together with the best scores of to-day.

M. R. A. Team Scores.

The Association is making some needed improvements on their range in way of new flagstaffs at 500 and 1,000-yd. ranges, and new dials and targets at 200yds.

PORTLAND, Ore., July 6.—The military target contest for the prize of $150 offered by the Fourth of July Celebration Committee took place at City View Park this afternoon. Company E, Veteran Guards, won the prize with 373 points. D. C. Southworth, of Company E, made the highest individual score, 45 out of a possible 50.

CREEDMOOR, July 22.—The riflemen who wended their way to Creedmoor to-day found it rather unpleasantly warm for shooting. Consequently the fifth competition for the gold champion marksman's badge was not as enthusiastically shot for as has been the case hitherto. The range, however, was in good condition and some fairly good marksmanship was exhibited. For the second time this season J. H. Lacroix, of the 14th regiment, was the winner of the badge with a score of 23 and 24, total 47. The other prize winners were:

	200yds.	500yds.	Total.
J W Haie, 7th Regiment	21	24	45
E DeForest, 22d Regiment	20	24	44

THE N. G. A.

(AN OPEN LETTER.)

Capt. H. C. West, Chairman Committee National Sportsmen's Convention, St. Louis, Mo.:

SIR.—We have this day mailed you the 500 postals (announcing your call for the meeting at St. Louis, Sept. 29, 1885) to the gun clubs in the States indicated in your list. It is to be hoped that the call will meet with a hearty response from every side; the National Gun Association will undoubtedly do what they can to further your object. Will you kindly permit me, in accordance with the request mentioned in your circular, to make a few public suggestions, as follows:

First—That you extend the range of your call to all the States and Territories; and

Second—That you carefully note Article III. of the Constitution of the National Gun Association, embodying the objects for which your meeting is called, and with the view of considering whether or not it would be practible for your convention to take hold of the work, as Mr. Stark says, "fairly started" and push it to a successful completion, especially as regards the protection and preservation of game and fish. You and your committeemen are, I believe, "business men;" it is not, therefore, amiss to ask you to look at this question from a practical, financial point of view. To make a success of the Association you are about to organize (or of any similar organization) requires not only a large amount of voluntary labor from its constituents, but also and more especially the continuous and salaried labor of one or more paid officials, whose sole business it must be to look after and duly execute the will of the Association; and this labor, to enforce your objects, must not only be for a day, month or year, but for a continued series of years. Hence you must formulate your plans so as to insure the financial support of your main executive officers from year to year, so that even when you, the present active spirits, will have retired, the good work which you have started will still continue. Therein lies the defect of existing State sportsmen's associations. If they had but one salaried officer, whose duty and sole business it would be to attend to the objects of the Association, to call upon the proper State officers to enforce existing laws, to frame petitions to the Legislature, signed by sportsmen throughout the State, for the enactment and enforcement of better laws, etc., etc., the present good laws would be enforced and the general object attained. Hence it behooves your committee to formulate your plans so as to insure a financial system for the future, which will insure the salary of at least one officer, who shall devote all his time to enforce your object.

Now what better plan can be suggested than an incorporation similar to that of the National Gun Association? Granted that such an organization will attain 1,000 members who pay only annual dues, you can feel secure in that at least one salaried officer will so be provided; in the course of time 5,000 similar members can be obtained, and the number and efficiency of your officers secured. By thus incorporating, you obtain a tenure of life for your creation which can in no other way be secured, and the machine once fairly established will run, time without end. We presume your committee realizes the amount of labor and expense required to obtain sufficient members and to properly organize such an incorporation. Why not therefore, save yourselves this labor and expense by taking the National Gun Association under your wing and completing the work already begun. Its constitution meets your requirements; it has about 190 active members in thirty-four States and Territories; the only argument that can possibly be brought to bear against such a union of combined effort springs from the aspersions of rival target manufacturers. Surely sportsmen will not permit such business rivalries to interfere with their community of feeling. Why not, therefore, save all your effort to induce your convention to join "The National Gun Association," amend its constitution, if need be, to meet your requirements, remove its office and books to your city, elect such a board of directors as may be mutually agreed upon, *pro rata* to the number of old members and the new members thus secured. I am confident that the present members of the National Gun Association, together with its officers and directors, will agree to do the above, to do anything in reason which will bring unity of action in securing the common objects desired.

CINCINNATI, July 25. Very respectfully yours,

J. E. BLOOM.

TEKAMAH, Neb.—Club shoot, July 22.—First contest, 7 live pigeons, 25yds.:

C E Bardwell	0011011—4	J A McLaughlin	1011100—4
J F Beard	0001110—3	C M Bryant	0111111—6
W S Craig	1111101—6	Geo Atwater	0110001—3
W H Eby	1010100—3	A T White	0010111—4

Shoot off: Ties of 6 divided first, Bardwell second and Beard third. Second contest, 5 live pigeons, 25yds.:

J F Beard	11111—5	W H Eby	00010—1
W S Craig	11110—4	Cash Bryant	10111—4
Geo Atwater	01100—2	A F White	11011—4
J A McLaughlin	11110—4	C E Bardwell	01101—3

Shoot off: Ties of 4 won by Bryant.

Third contest, 7 Peoria blackbirds, 18yds.:

C E Bardwell	1110011—5	W H Eby	1101100—4
J F Beard	1110111—6	J A McLaughlin	1000001—2
A T White	1111101—6	W S Craig	1111111—7
Geo Atwater	0101110—4		

Shoot off: Ties of 9 won by Beard.

Fourth contest, 7 blackbirds, 18yds.:

Beard	1111110—6	Craig	1010011—4
White	1111110—6	Atwater	1000101—3
Bardwell	1110110—5	Eby	1111100—5

Ties of 6 divided, tie on 5 won by Bardwell.

COLMA, Cal., July 12.—An interesting tournament, open to all sportsmen in the State, was given under the auspices of the Lincoln Gun Club at Colma to-day. An entrance fee of $2.50 was charged, and the match was at 16 clay discs, 15yds. rise, hnd was governed by international rules. Thirty-six entered, and it was agreed at the start that the stakes should be divided into purses of 50, 35 and 15 per cent. Annexed will be found the leading scores made during the rather lengthy contests:

H Venker	1110111011111111—13	Walton	1101001011010001— 8
Mellish	0011110111111001—10	Mangels	1111111110100000—10
B Macenroe	0110011110101011—10	E Funck	1001001110101011— 9
W J Golcher	1101210111111110—12	Brannon	1111011100000000— 7
Meaney	1010111010100011— 9	Bruns	0010111111111001—10
A Macenroe	1111010000111111—10	C Foster	0001010111111100— 8
Martin	0001111000111111— 9	Cate	1101100001101101—9
Currier	1000111110100010— 8	Edler	1000111010111110— 9
Fox	0110100111101101— 9	Parks	1111010111111001—11
Drinkhouse	0011010000111101— 8	P Funck	0011100000110111— 8
Lyon	0011111111111001—11	Straude	1100110011111010— 9
Peterson	1100110111111110—11	Rogers	0101110110111101—10
Campbell	1110110010010100— 8	Conley	1100111011111000— 9
H C Golcher	1111101000010110— 8		

From the above it will be seen that H. Venker took first money and W. J. Golcher second. The third prize was divided between Lyon, Peterson and Parks, who each broke 11 discs out of their possible 15.

MALDEN GUN CLUB.—The regular weekly shoot, under the auspices of the Malden Gun Club, was held at Wellington July 25, when the following sweepstakes were shot: 1. Five clay-pigeons—Shumway and Lander divided first. 2. Five clay-pigeons—Shumway and Lander divided first. 3. Five blackbirds—Adams, Loring and Lander divided first. 4. Five clay-pigeons—Stanton first. 5. Five blackbirds—Loring and Souther divided first. 6. Ten clay-pigeons—Stanton and Pond divided first. 7. Five blackbirds—Stanton first. 8. Five blackbirds—Loring first. 9. Five clay pigeons—Schaffer first. 10. Five clay-pigeons—Adams first. In the medal match Stanton was first with 9, Snow second with 8, and Shumway third with 7.

BOSTON GUN CLUB.—There was a large attendance of shotgun shooters at the range of the Boston Gun Club, at Wellington, on the 25th, to compete in the champion match. A strong wind prevailed, which sent the left quartering birds 85yds. from the trap, making the shooting very difficult. Following are the results of the separate events: 1. Seven singles, 1 trap, 18yds.—D. Mitchell and D. A. Ward divided first. 2. Seven birds—B. A. Ward first. 3. Seven singles—Spencer first. 4. Seven birds—Cutting and Ward divided first. 5. Seven birds—Snow first. 6. Seven birds—Cutting, Ward and Snow divided first. 7. Same conditions as above—Ward first. 8. Seven singles—Snow and Smith divided first. 9. Straightaway—Warren first. The winners in the champion gun match were: First, B. A. Ward; second, G. F. Cutting and I. S. Snow; third, Dr. Kirkwood. L. Adams stands first for the visitors' prize.

SAN FRANCISCO, July 12.—There was but a slim attendance at San Bruno to-day, owing to the tournament at Colma. The fourth medal shoot of the California Wing Club was held, however, and considering that the wind—as usual—was unfavorable, some very good scores were made. The match was at 12 single birds, 18yds. rise, and 80yds. boundary. Robinson faced the traps first and easily made a clean score, but seldom using the second barrel. Fay followed and also made 12 straight kills. He made several very difficult shots, and the spectators were considerably surprised at the amount of skill he displayed and the rapidity with which he used his second barrel. Walsh and Kerrigan each scored 11 out of a possible 12. Pearson came next and made a record of 10 kills. The score made was as follows:

Robinson	111111111111—12	Kerrigan	111111110111—11
Fay	111111111111—12	Brant	101101110011— 7
Walsh	111111111011—11	Slade	101111101011— 9
B Golcher	110101111101— 9	Pearson	111111110011—10

The tie between Robinson and Fay was shot off at 12 birds. Robinson's sixth bird was a tough one and managed to get outside of the boundary although it had two loads of shot in it. This reduced his record to 11. Fay was more fortunate and made 24 straight kills. The choice of medals, therefore, came Fay first, Robinson second, and Walsh, by permission of Kerrigan, third.

ALLENTOWN, N. Y., July 25.—The East Hill Gun Club had a pleasant and well attended shoot at their grounds this afternoon, at 30 clay-pigeons, 20 singles and 5 pairs doubles, N. G. A. rules. The score was as follows:

J Fay	111101010111111111000	10 11 00 11 01—20	
W W Curtin	000000101010110001 01	00 00 10 00 00— 7	
L D Strayer	100001110100010111	11 00 11 00 11—17	
E R Curtin	101100110100010010	10 10 10 10 10—15	
Z Stamm	101011111111110011	01 00 11 10 01—20	
S H Brown	000001110111011100	10 10 10 11 11—18	
J E Cable	100110010101010011	00 01 10 10 10—13	
D M Philips	010100101000101011	11 00 10 00 11—15	
F J Weston	011010100011000110	10 10 10 10 11—14	

Fay won shoot off.—S.

July 24 to Aug. 8—A. C. A. Meet, Grindstone Island.

AMERICAN CANOE ASSOCIATION.

SECRETARY—C. A. Neidé, Schuylerville, N. Y. Candidates for membership must forward their names, with $2 for initiation fee and first year's dues, to the secretary, who will present the names to the executive committee. Money should be sent by *registered letter* or money order.

OSHKOSH, Wis., July 24.—The annual race for the championship of the Oshkosh C. C. was called at 2:20 P. M. yesterday, with but six entries, who finished as follows: Bon Ami, R. P. Sinney, 61m. 20s.; Genevieve, F. H. Gary, 51m. 45s.; Rene, W. A. Session, 54m. 31s.; Meta, G. Simm, 61m. 00s.; Alice, O. Schloerb, and Sis, A. M. v. Kaas, not taken. Course triangular, 5 miles, wind west, strong.—OSHKOSH.

THE A. C. A. MEET.

MANY canoeists are now in camp at Grindstone, and others are arriving every day. Dr. Neidé is hard at work, and all is ready for the races next Monday. The prospects are that the meet will be a very large one, and while many older members will be missed, there will be a number of new men present. The settlement at Squaw Point will be larger than in '84. The programme of the races is as follows:

FIRST DAY, AUG. 3.

No. 1. 9:30 A. M.—Paddling Class III., 1 mile.
No. 2. 9:45 A. M.—Paddling Class II., 1 mile.
No. 3. 10:30 A. M.—Sailing Novices' Classes A and B, no limits to rig or ballast, open only to members who never sailed a canoe before 1885, 1½ miles.
No. 4. 11:30 A. M.—Paddling Class IV., 1 mile.
No. 5. 11:45 A. M.—Paddling Class I. (This race exempt from "1 man 1 canoe" rule) 1 mile.
No. 6. 1:45 P. M.—Sailing Class B, no limits ballast or rig, 3 miles.
No. 7. 2 P. M.—Sailing Class A, no limits ballast or rig, 3 miles.
No. 8. 3 P. M.—Paddling and Sailing combined, Classes A and B (paddle ½ mile, sail ½ mile, paddle ½ mile, sail ½ mile, paddle ½ mile, sail ½ mile, on triangular course of ½-mile sides), 3 miles.
No. 9. 4:00 P. M.—Paddling tandem, Classes III. and IV., decked (canoes for this race must be decked on half their length), 1 mile.
No. 10. 4:15 P. M.—Paddling tandem, Classes III. and IV., open (only for paddlers who do not race in No. 9), 1 mile.
No. 11. 4:30 P. M.—Upset race, any Class II. or larger canoe (no special appliances allowed unless usually carried in cruising, at signal every canoe must be turned completely over), 200ft.

SECOND DAY.

No. 12. 9:30 A. M.—Paddling Class IV., cruising trim (canoe and load any material, to weigh 200 pounds or more), 1 mile.
No. 14. 10:30 A. M.—Sailing Class B, no ballast, 3 miles.
No. 15. 10:40 A. M.—Sailing Class A, no ballast, 3 miles.
No. 16. 11:40 A. M.—Paddling Class II., cruising trim (canoe and load to weigh 120 pounds or more), 1 mile.
No. 17. 2:00 P. M.—Sailing Class B, cruising rig (sail limited to 75ft., any ballast), 1½ miles.
No. 18. 2:10 P. M.—Sailing Class A, cruising rig (sail limited to 50ft., any ballast), 1½ miles.
No. 19. 3:00 P. M.—Paddling Class III , cruising trim (canoe and load to weigh 160 pounds or more), 1 mile.
No. 20. 3:15 P. M.—Sailing unclassified canoes, no limits ballast or rig, 1½ miles.
No. 21. 4:15 P. M.—Hurry scurry, with swim, 100yds. run, canoes moored 50ft. from shore, paddle 200yds.
No. 22. 4:30 P. M.—Gymnastics.

Second day of this programme will be Tuesday, Aug. 4, unless weather prevents or some of Monday's races are postponed, in which case Monday's programme will be finished if possible and the remainder of the day be devoted to special races or sports, and the second day will be Wednesday, Aug. 5. In absence of wind the sailing races will be called at their appointed time. Punctuality will be insisted on, no race will wait for any members. Any event delayed by lack of wind or by reason of the preceding one not having finished will be postponed to the same hour next day, and the next event started at its appointed time. All A. C. A. rules will be enforced.

"All-round record" with five prizes will be based upon all events in this programme except Nos. 3, 5, 9, 10, 20, 21, 22, that is upon 7 paddling, 6 sailing and one combined, every classified canoe (except Class I.) being eligible alike for 3 paddling races, 3 sailing and 1 combined. For No. 5 members may bring and use another canoe besides the one allowed under Rule II. for other events.

First and second prizes in all events except 22.

LAKE ERIE CANOE MEET, JULY 18-25.

CAMP GARDNER, BALLAST ISLAND,
PUT-IN-BAY, LAKE ERIE, July 21, 1885.

SINCE the formation of the American Canoe Association in 1880 there have always been a number of Western canoeists connected with it, some of whom have been present each year at the meets; but the great distance has prevented a general attendance, and many earnest canoeists, long members of the A. C. A., have never attended an Association camp. Canoeing is growing rapidly throughout the West and there are many flourishing clubs, but, chiefly on account of the distance, their members do not, as a rule, belong to the Association. Some members of the Cleveland C. C. who are in the habit of spending a part of each summer at the Erie Islands, opposite Sandusky, suggested last winter the idea of holding a canoe meet at the islands to which all Western canoeists should be invited; and the idea was promptly acted upon. As the scheme progressed under the leadership of Commodore Gardner, of the Cleveland C. C., and also commodore of the Cleveland Yachting Association, it was expanded into a general meet of canoeists, yachtsmen and boating men, all of whom were invited to be present, with the assurance of races of all kinds for them. Committees and officers were appointed by the Cleveland clubs, all arrangements for the meet—race courses, prizes, camp grounds, etc.—were made by them, and invitations were sent to all canoeists, yachtsmen and boating men in the West to attend the meet. It was decided not to hold the meet under the auspices of the American Canoe Association, but to invite all to attend, and during the meet to take steps toward some form of permanent organization both for yachtsmen and canoeists, the details of which should be determined by those present.

Ballast Island, the site selected for the camp, is one of a group of half a dozen islands, in size varying from twenty to 2,000 acres and known as Lake Erie Islands, being situated off Sandusky, Ohio, in Lake Erie. The largest of the group, Put-in-Bay Island, is celebrated as the spot where Perry repaired to refit his fleet after his famous victory, taking refuge in the beautiful little harbor now known as Put-in-Bay. Two miles N. E. lies a little rocky inlet of about ten acres in extent, where the same tradition says that Com. Perry stopped to take in ballast before his battle, whence the name which it still bears. A foundation for the story is evident on the S. W. shore, where the sloping beach is covered thick with round white stones as large as one's fist, and where if he did not get ballast, he could have found it if he wished, which, after seventy years, answers the same purpose. On one-half of the island, facing about N. E., the shore is steep and rocky, and on the other it is quite low with stone beaches. The island is now the property of five gentlemen who use it for a summer resort for their families, as well as a fishing camp in season, the waters of the entire region being noted for their fish. There are on the island thirteen cottages, the handsomest being a log house cosily furnished, belonging to Commodore Gardner. It is situated in a fine grove of trees by the water's edge. A dining hall is situated on the N. W. side, where the cottagers take their meals. The island is covered with gardens and orchards and the groves afford good camp sites, while a little dock with deep water allows large lake steamers to call.

A mile to the west is Middle Bass Island, with headquarters of the Toledo Club. Steamers from various lake ports call at several of the islands every day. The distance to Cleveland is 65 miles, Toledo 40 miles, Sandusky 16 miles and Canada 30 miles. Near by are Green Island, Rattlesnake Island, Middle, Gull, Sugar, North Bass, Kelley's and Point Pelee islands, all beautifully wooded and several of them boasting large vineyards famous for their wines. No finer location could be selected for a meet, both for yachts and canoes. Open courses on the deep, dark green waters, the beautiful harbor of Put-in-Bay, with its fine anchorage, and the excellent camp sites offer every advantage for water sports of every kind.

The committees in charge arranged an extended programme, beginning with the open regatta of the Cleveland Yachting Association on July 16, a cruise to the islands on the following day, making camp on Saturday and following programme of races and meetings:

Monday, July 20, business meeting to arrange for a plan of organization.

Tuesday, yacht regatta and race of pound boats, with a ball at Wehrle's on Middle Bass Island.

Wednesday, canoe races, 9:30 A. M., Class I. paddling, 1 mile; 10 A. M., Class III., paddling, 1 mile; 11 A. M., Class II., paddling, ½ mile; 1:30 P. M., Class B, sailing, 3 miles, no limit to ballast or rig; 3 P. M., Class A, 3 miles, sailing, no limit of ballast or rig; 4:30 P. M., upset race.

Thursday, 9:30 A. M., Class C, 3 miles, sailing; 11 A. M., all classes, 3 miles, sail 1 mile, lower sails and paddle 1 mile, sail 1 mile; 2 P. M., Class V., paddling, 1 mile; 2:30 P. M., Class IV., paddling, 1 mile; 3 P. M., all canoes, sailing, for men who have never sailed a canoe before 1885, 2 miles; 4 P. M., hurry scurry race, run 100yds., swim to canoe and paddle 200yds. In the evening a supper to canoeists and yachtsmen at the Beebe House.

Friday, 10 A. M., sailing, open canoes only not over 18ft., 3 miles; 11:30 A. M., novices paddling, ½ mile, for those who have never paddled a canoe up to 10 days before the race; 2 P. M., any canoes, sailing, 3 miles, open only to winners of previous races; 3:30 P. M., any canoes, paddling, 1 mile, for winners of previous races; 4 P. M., upset race; 8 P. M., meeting for presentation of prizes and for business.

A classification as follows was devised by the Regatta Committee, Messrs. Fred Keith, E. S. Wright and O. S. Root: Paddling—Class I., length not over 16ft., beam 26 to 30in. Class II., length not over 18ft., beam not under 30in; Class III., not over 18ft., beam not under 24 and not over 28in.; Class IV., open canoes, single or double blades; Class V., tandem canoes. Sailing—Class A, length not over 16ft., beam not over 28in.; Class B, length not over 18ft., with a limit of 28½in. beam for that length. The beam may be increased ¾in. for each full 6in. of length decreased. Class C, length not over 18ft., any beam, with allowance of 6 seconds per foot per mile, open or decked canoes. The rules of the American Canoe Association were adopted. The prizes were handsome flags, of which a number were made by lady friends of the canoeists.

After the races at Cleveland, an account of which is given in another column, the fleet sailed for Put-in-Bay, arriving on Saturday, and several canoeists also cruised up from Cleveland, while others arrived from various points by steamer. By Saturday night a number of tents were pitched on the northeast shore in a fine grove of trees, and a fleet of canoes were on the beach, while a number of yachts were anchored in Put-in-Bay. On Sunday service was held outside of Com. Gardner's cottage, Rev. G. T. Dowling of the Euclid Avenue Baptist Church of Cleveland, officiating. On Monday more canoeists arrived, among them Dr. C. A. Neidé, Secretary A. C. A., until Cleveland, Toledo, Chicago, Cincinnati were represented. In the evening a meeting was held in camp, at which the question of organization was discussed, and a committee consisting of H. D. Crane, Cincinnati; O. H. Root and C. F. Pennewell, Cleveland; J. O. Hepburn, Toledo, and W. P. Stephens, New York, were appointed to present a plan of organization. Another committee—Messrs. G. Henry Gardner and F. W. Keith, Cleveland, and W. J. Brown, Cincinnati—were appointed to fix a place for the next meeting.

To-day has been devoted exclusively to the yachts, as given in our yachting columns, the sports ending with a ball at Wehrle's on Middle Bass, at which yachtsmen and canoeists were present. To-morrow the first canoe races begin. Only two Eastern canoeists, Dr. Neidé and Mr. Stephens of the New York C. C., are present.

WEDNESDAY, JULY 22.

The first day of the canoe races opened clear and bright, with a good breeze and smooth water. At 9:30 A. M. the judges, Messrs. Short, Axworthy and Jones, called race No. 1 for Class I., paddling, 1 mile. The course for paddling was from the wharf to Black Buoy No. 7, distance about ⅞ mile, but not measured. The sailing course was triangular to a marked boat off Middle Bass Island, thence to a markboat off Put-in-Bay Island and home, about 2¾ miles, but intended for a 3-mile course. As none of the courses were accurately known, the times cannot be used for comparison with records over other courses. The starters were: Psyche, F. W. Keith; Cleveland Greys, G. H. Gardner; Little Fraud, C. F. Pennewell; Mary Brady, O. H. Root; all of the Cleveland C. C. The start was made at 9:32 A. M., Psyche and Cleveland Greys keeping well together, but the former finally took the lead and won in 11.13. The times were: Psyche 11.13, Cleveland Greys 11.19¾, Mary Brady 11.30, Little Fraud 11.41.

The second race, Class III., paddling, same course, brought out Fannie L., F. W. Keith; Cleveland Grays, R. W. Yorke; Mary Brady, O. H. Root; all of the Cleveland C. C. Start, 10:19:01 A. M. Fannie L. won in 12.37, Cleveland Greys second, 13.02, Mary Brady third, 13.15.

The entries for the third race, half mile paddling, Class II., were: Laura, W. W. Hite, Cincinnati C. C.; Gipsy, J. W. Hepburn, Toledo C. C.; Nick L. and George El, G. H. Gardner, Cleveland C. C.; City of Cleveland, C. F Pennewell, Cleveland C. C. The start was made at 10:48 A. M. The Nick L. and George El, Com. Gardner's new Sunbeam, named after two well known Cincinnati canoeists, and paddled by Com. Gardner's son, won easily in 5.52, Gipsy 6.28, City of Cleveland 6.29, Laura 6.35.

After dinner No. 4, three miles, Class I., sailing, no limits of rig or ballast, was called, the starters being: Gip, H. D. Crane, Cincinnati C. C.; Fifine, W. I. Brown, Cincinnati C. C.; Gipsy, J. W. Hepburn, Toledo C. C. Several others were entered but did not start on account of the weather. The two Cincinnati canoes had lug dagger boards and the single lateens used by the C. C. C., while Gipsy carried a Mohican rig. Starting together at 3:47 in a high wind and rough water, Fifine, well handled, led over the course, winning in 49.53, with Gip in 50.40.

At 4:05 the Class A race, under the same conditions, was started with the following entries: Laura, W. W. Hite, Cincinnati C. C.; Cuyahoga, C. F. Pennewell, Cleveland C. C.; Mary Brady, O. H. Root, Cleveland C. C.; Cleveland Greys, G. H. Gardner, Cleveland C. C.; Fannie L., F. W. Keith, Cleveland C. C. The wind was still heavy and water rough, capsizing Fannie L. at the first mark. The Cleveland Greys won in 46.20.

To-day's sports finished with an upset race, the starters being Messrs. G. H. Gardner, F. W. Keith, O. H. Root, and R. H. Yorke. Mr. Gardner was quickly in his canoe and won easily. Many visitors were here to witness the races, and a number of sailing and steam yachts were over the course and anchored near the wharf. In the evening all visited Put-in-Bay to be present at the awarding of the yacht prizes.

THURSDAY, JULY 23

Like the preceding days, the weather here is perfect for camping out, hot at midday, but with pleasant breezes at all times.

The races began with No. 7, Class C sailing, 3 miles. The allowance proposed was found to be unfair to the longer but smaller boats, so another was substituted, the smaller boats receiving 3min. each from the larger ones. Nine canoes were started at 11:07, as follows: 30in. beam and over (allows 3min.)—Fifine, W. I. Brown, Cincinnati C. C.; Gip, H. D. Crane, Cincinnati C. C.; Gipsy, J. W. Hepburn, Toledo C. C.; Viola, Geo. Miller, Toledo C. C.; Cricket, J. O. Shiras, Cincinnati, O. Under 30in. beam—Cleveland Greys, G. H. Gardner, Cleveland C. C.; Mary Brady, O. H. Root, Cleveland C. C.; Fanny L., F. W. Keith, Cleveland C. C.; Laura, W. W. Hite, Cincinnati C. C. One minute was allowed between signals at the start, the time being taken from the second whistle. All were off very well together, Fifine first, Gip, Cleveland Greys and Cricket, the wind being light from S.E., with smooth water. Fifine led in the reach to first mark, turning at 11:15:45; Gip, 11:16:26; Cleveland Greys, 11:17.35; Fannie L., 11:17:40; Viola, 11:42:00; Laura, 11:18:13; Cricket, 11:19:00. All stood on port tack for second mark, Fifine ahead, then Fanny L. and Gip. At second mark the times were: Fannie L., 11:41:15; Fifine, 11:41:35; Gip, ——. The wind became lighter and held so to the finish. Gip missed the second mark and gave up, having steered for the wrong boat. Fanny L. came in at 11:56:20; Fifine, 11:57:08; Gipsy, 12:01:30; Cleveland Greys, 12:01:48. Fanny L. wins by 48sec. in addition to an allowance of 3min. from Fifine.

After dinner the first race was No. 8, all classes, sail 1 mile, paddle 1 mile, and sail again 1 mile to finish. Four canoes started; Laura, W. W. Hite, Cincinnati C. C.; Fannie L., F. W. Keith, Cleveland C. C.; Cleveland Greys, C. F. Pennewell, Cleveland C. C.; Gipsy, J. W. Hepburn, Toledo C. C. At 2:42:10 all went off free for first mark with booms to port, jibing at the mark at 2:53:20, and lowering sail. The stretch under paddle was finished by Fannie L. at 3:2:30, when she set sail again, making long and short legs to finish and crossing at 3:29:52, her time being 47.42. Laura was second in 47.55, the others being well astern.

As no open nor tandem canoes were present, races 9 and 10 were omitted, and No. 11 was called at 4:4:45, a novice's race for all canoes, with 8 starters: Fannie L., C. C. Clark; Cleveland Greys, J. O. Gardner; Gip, W. W. Hite; Cricket, J. O. Shiras; Laura, C. H. Walker; Mary Brady, R. H. Yorke; Cleveland Greys, C. F. Pennewell; Fifine, W. D. Breed. The wind was strong for novices. The course was 2 miles only, out and back. Starting at 4:4:45, Mr. Walker, never in a canoe before, soon took the Laura ahead, turning neatly at the mark, while all the others ran up, head to wind and hung there helplessly. Coming home Laura had a long lead, but lost it by neglecting to trim the mizzen on the wind. Gip and Fifine finally turned and came in chase, both being better handled, and within two lengths of the line Gip passed Laura, whose crew seized half a paddle and put his boat across first, thus losing second prize, which went to Fifine. The times were: Gip 27.10, Fifine 28.25.

A novice's paddling race was added next, the starters being: Mary Brady, W. B. Goodwin; Little Fraud, R. H. Yorke; Cuyahoga, C. F. Pennewell; City of Cleveland, J. O. Gardner. Distance ¾ mile. Starting at 5:14:45, Cuyahoga led all the way with Little Fraud second, the times being 11min. and 11.35. During the race a heavy squall came up, and it was finished in a heavy rain, which caused the postponement of the hurry scurry race. After supper all was clear again and the canoeists went over to the supper at the Beebe House, at which nearly a hundred were present, all returning to camp late at night. The races of the day were managed by Messrs. J. Geo. Downie and W. P. Stephens. During the day a "pound" boat race was sailed around the islands.

FRIDAY, JULY 24.

To-day has been like the previous ones, clear and beautiful, with plenty of wind for the sailors, and none of the calms which are so bad at Lake George and Grindstone. A steady breeze seems to be always blowing over the course, changing little in direction during a race. Both in this respect and in beauty of location, Ballast Island is ahead of the other camps.

Race No. 13 was changed, no open canoes entering, and was made open to all with the same allowance as in race No. 7: Class C (30in. and over).—Gip, H. D. Crane, Cincinnati C. C.; Fifine, W. I. Brown, Cincinnati C. C.; Gipsy, J. W. Hepburn, Toledo C. C.; Fawn, E. Holmes, Toledo C. C.; Cricket, J. O. Shiras, Cincinnati. Under 30ins.—Cleveland Greys, G. H. Gardner, Cleveland C. C.; Fannie L., F. W. Keith, Cleveland C. C.; City of Cleveland, J. O. Gardner, Cleveland C. C.; Mary Brady, W. D. Breed, Cincinnati; Laura, W. W. Hite, Cincinnati C. C. The wind was quite strong from S. W. when all went over at 10:51 A. M., Gip and Fifine both making good starts. On the reach across Fannie kept the weather place with Fifine near her. Fifine turned first, then Fannie and Gip. All the fleet fetched to leeward of second mark after working across, Fannie leading, then Fifine, Gip and Laura, the others strung out. All broke tacks below

the mark to beat up. Fifine did by far the best work to windward, and took a good lead. All came home free, booms to starboard. The times were: Fifine 35.38, Gip 39.32, Fannie 40.08, Gipsy 41.21, Laura 42.10.

The next race was No. 15 sailing, for winners of previous races only. The starters were: Gip, H. D. Crane, Cincinnati C. C.; Laura, W. W. Hite, Cincinnati C. C.; Fifine, W. I. Brown, Cincinnati C. C.; Fannie, F. W. Keith, Cleveland C. C. The Cleveland Greys entered, but broke her tiller on the line and withdrew. The wind still blew quite strongly, but the water was smooth. All went off at 11:55 A. M., Gip and Fifine making good starts, with Laura across third. The race was quickly sailed, Fifine leading all the way. The times were: Fifine, 38.05, Gip 36.00, Fannie L. 39.00 and Laura 40.15.

Following this came a mile paddle for winners, Race No. 16, with three starters: Psyche, F. W. Keith, Cleveland C. C.; Cleveland Greys, C. F. Pennewell, Cleveland C. C.; Cuyahoga, O. H. Root, Cleveland C. C. The race was started at 12:45:00, Psyche leading and winning easily in 10.04, with Cuyahoga in 10.49.

Immediately after dinner to day a meeting was called in camp, Com. Gardner presiding. The Committee on Organization reported, recommending the formation of a Western Association of Canoeists, and that measures should be taken to consult with the American Canoe Association as to some plan for a united association. The report was accepted and the election of officers followed. Mr. Crane nominated Com. Gardner, who was unanimously elected Commodore, and Mr. Brown nominated Geo. B. Ellard, of Cincinnati, for Vice-Commodore, who was also elected. Mr. W. H. Eckman, of Cleveland, was elected Secretary. The Committee on Location reported in favor of a meet at the present camp in 1886, which was adopted and a motion to that effect passed. Com. Gardner appointed as an Executive Committee, Messrs. W. I. Brown, of Cincinnati; J. W. Hepburn, of Toledo, and Woodruff, of Chicago.

The following resolution was adopted:

Whereas, The Western A. C. A. has been duly organized on the 24th day of July, 1885, at Ballast Island, Lake Erie; and

Whereas, The said association is desirous of encouraging canoeing in this country, and organizing rules, regulations, etc., that govern the canoers throughout North America; therefore be it

Resolved, That a representative be elected from this Association, with instructions to present the action taken at this meeting to the A. C. A. at its meeting at Grindstone Island, and that the said representative express to the said A. C. A. our willingness to reorganize the said W. C. A. on a basis which will place this Association on an equal footing with such an organization as may be formed by Eastern and Canadian canoers.

In pursuance of this resolution Mr. W. P. Stephens was elected a representative to the A. C. A. meet at Grindstone Island, after which the meeting adjourned. A photographer was present in the afternoon and secured views of the camp and boats. Another squall with rain and high wind put a stop to further races, but cleared by sunset with a beautiful double rainbow. In the evening the water was covered with boating parties in canoes and sailboats, the nearly full moon making the night very beautiful.

An Executive Committe meeting was held at headquarters, at which the A. C. A. Constitution, By-laws and Sailing Rules were read and adopted with the amendment of several minor points to adapt them to the uses of the Western A. C. A. To-morrow, besides the postponed races, others will be held at the Toledo club house on Middle Bass Island.

SATURDAY, JULY 25

The first race this morning, No. 14, was a half mile paddle for novices who had never paddled up to ten days prior to race. The entries were: Psyche, Geo. Chandler; Laura, W. W. Hite; Cuyahoga, F. Root; Fannie L., R. Yorke; Nick L. and George El, George Ford; Little Fraud, W. Breed. The race was started at buoy 7, and was won by Cuyahoga, in 8.03.30, with Nick L. second.

The next race was a special one for a handsome flag presented by Mr. Brady, of Cleveland, 1 mile, canoes of 30in. and over. Only two entered: City of Cleveland, F. W. Keith, Cleveland C. C.; Nick L. and George El, W. P. Stephens, New York C. C. Starting at 10:13:10 the Nick L. took the lead and at the quarter led by nearly a length, increasing to one and a half lengths at the buoy. Here the other boat gained in the turn, coming up to a length astern. The race home was very exciting, as the City of Cleveland gradually overhauled the leader, but could not pass, the Nick L. winning by a length in 9.50.

The twelfth race, postponed from Thursday, was very amusing to the spectators. The boats were set adrift 50yds. from the wharf, the contestants running 100yds. on the wharf and diving off, then entering the boats after a swim and paddling 100yds. with half a paddle. Mr. Woodruff, of the Chicago C. C., was first in the run, with Mr. Backus, of Cleveland, beside him, with four others near. Backus reached the water first with a long dive, Woodruff close to him, and the former was first in his boat, but was slow in getting under way and fouled Mr. Keith. Woodruff swung his single blade well and took first, with Keith second.

An upset race followed with four entries, won by Geo. Ford, with Keith second. After this was a trial of skill in walking around the foremast of a canoe, won by W. Breed, with Mr. Keith again second. The prizes were distributed at noon in front of the cottage, the flags being very handsome.

CAMP GARDNER, BALLAST ISLAND, JULY 26.—After conclusion of the races at camp yesterday the canoeists crossed with their boats to the Toledo club house on Middle Bass Island, a large summer hotel surrounded by handsome grounds and a number of small cottages, all owned by a club of Toledo gentlemen, whose families occupy the hotel and cottages in summer. Prizes had been offered by the guests for canoe races, the first of which was a paddling race ¾ of a mile with handicap, won by F. W. Keith in the Psyche. Following this was an upset race with 5 entries, 200yds with two upsets, won by G. H. Gardner. A hurry skurry race, 4 entries, 200yds run, 100yd. swim and a paddle home, was also won by Mr. Gardner. A sailing race over a 2 mile course brought out 4 entries and was won by G. H. Gardner in the Gip, with W. I. Brown second in the Fifine, times: 42.30 and 47. In the evening all attended the hop at the Toledo Club, and on Monday the camp will be comparatively deserted.

A CRUISE ON THE TAUNTON RIVER.

DURING the winter and early spring of '84, I had a serious attack of the "canoe craze," which resulted in my becoming the rather dissatisfied possessor of a 10½×26 decked canoe, splendidly built, and fitted with mast, sail and jointed double paddle. I was dissatisfied because I wanted all this at a weight of under thirty pounds, and though I never weighed them I found they varied from sixty to two thousand pounds, according to the distance I had to move them overland. I used this canoe one or two afternoons, and in August, being reduced to 110 pounds by a combination of fever and book keeping, determined to make a short voyage for rest. Looking over the map of Massachusetts, I found that the Taunton River ran in about the direction I wanted to go, and judging (from the same authority) that it must be about the right size for a start at Brockton, I expressed the canoe there.

Taking train next morning at Boston with a basket of blankets, food, etc., I reached Brockton at 9 A. M. Here I hired a team, loaded the canoe on it and started for the Taunton River, which is about two miles (by map) east of Brockton. My good friend, Mr. Nye, who owned and drove the team, didn't remember any river crossing the road, only a small brook; but having great faith in the map, and no other running water being near, I decided that the brook was my river and would soon grow. So launching the canoe on a stream 8ft. wide and two deep, I bade farewell to my friend, who looked as if he bade good-bye to all hope of ever seeing me alive, and was very particular that I should promise to write to him if I ever got any where. I have no doubt he expected me to give it up or get lost inside the first mile.

Soon after starting I found the brook (Taunton River) badly choked with bushes, and in some places with old fence rails, needing all the little strength and large amount of patience I started with to scrape, slide, crawl or float under, over or through the obstructions. The "brook" was narrow, the bushes and bugs thick, the day hot, and during the first two miles I took in an assorted cargo of leaves, twigs, spiders, bugs and beetles large enough to last a whole season. After four or five miles of this style of locomotion the stream gradually broadened into a long mill pond, with swampy land covered with bushes on both sides. The bottom of the pond contained a thick deposit of sawdust, easily stirred up by the paddle, while its surface for nearly a mile was almost covered by lilies; in some reaches were countless numbers of the small ones hardly an inch in diameter, but very perfect and fragrant. At the lower end of the pond the water was very deep, ending at a dam which was also a road to an old deserted mill standing just below the dam. After a rest and lunch in the shade I walked down through the woods and brush, which was very thick, to see how I was to get along further. The stream running from the dam was shallow, but over a steep, rocky bed and extended a quarter of a mile, where it would have been almost impossible to get the canoe through. Going back to the dam I dragged the canoe across it and the old road and through a rough opening to the old mill race, where it was stoned up on both sides some eight or nine feet, and at the bottom of which a little water was running. After carefully lowering canoe (endwise) and baggage down the perpendicular wall of the race, I waded, floated and dragged along about a quarter of a mile to where the race joined the stream, where it had a smooth, pleasant current, banks about fifteen feet apart; then little whirls past or between small rocks, and once a broad gravel bank with not enough water to float in, and just below this a dash under a little dark bridge where you could not see through until fairly under it, and, as the current slowed up, a little bridge of stringers and boards just high enough to squeeze under, then out into a pond with a narrow channel among lilies to a gate.

Just here was a very peculiar formation, partly natural and partly artificial. A ridge ran along about three or four hundred feet, forming part of one side of the pond, and had been strengthened into a dam, with a narrow but deep gate in it, the land on the other side of the ridge appearing to be twenty or thirty feet lower than the pond, and sloping away to meadows still lower. Leaking through the gate was enough water to make a small, rocky brook, and further along, at the end of the dam, an almost straight brook or river (probably artificial), about twelve feet wide, leading along about a third of a mile to a round pond that ended at another ridge or a bend of same one, and looking out over the low meadows beyond. A wooden planing mill and an icehouse stood along the sandy edge of the pond, and below on the slope one or two dwellings. My "river" appeared in the shape of a small brook, winding along in the meadow about four or five hundred feet distant. No one here could or would tell me the name of the settlement, perhaps it hadn't any, and after a rest I started to drag the canoe overland to the river. During the course of that drag I took a lesson in "weights and measures" not laid down in any arithmetic. The sun was broiling hot, the road I crossed sandy, and several men who didn't offer me any help stopped working long enough to wonder and even ask if I "wasn't a fool to be playing with a little boat like that." One even walked down behind me to see that I found the brook, perhaps to be ready to help if I gave out.

Since then it has sometimes occurred to me that perhaps I was a fool to have been there, instead of in the doctor's hands, but doctors can't cure the "canoe craze." I was trying to cure it, and plodded along dragging a canoe that, all loaded, weighed about six; from here and a visit to a house for a drink of well water I paddled down to the road which runs below, and is really part of the dam.

Below this was a carry or drag of an eighth of a mile before good water could be reached owing to rocks and other obstructions. Four or five boys who were swimming above the dam quickly dressed at the word pay, and with the help of about six on the painter I crossed the road and started down the other side and through the grass on a run, which soon became a walk and then a drag, finally reaching water at a very slow pace. Here the boys stood quietly around waiting to see the canoe float away; perhaps they were wondering how they should invest their wealth; but it seemed more than likely they were studying out the problem of increased weight, which had so nearly overcome me at my last carry. And just here, from an eighth to a quarter of a mile below the dam at East Bridgewater, is where I should have started instead of at Brockton, and any one who lives in Eastern Massachusetts and can float from East Bridgewater to the next village below (Elmwood) and don't do it, will miss something worth going miles to see. The river at first is about fifty feet wide, and soon runs between rather high wooded banks, and is very beautiful; the last half is a little more narrow with banks from three to eight feet high. The trees along the banks and in the fields have been allowed to grow, and in August, when the grass had started up on the sloping banks after the first mowing, it was like drifting through a beautiful park, new views at every wind and turn, making pictures that were constantly changing, beautiful and unexpected. From the shore you may see part of the water and the opposite bank, from the canoe you see both banks, every ripple, shadow, low-growing flower or wild plant, and many of the strange double pictures caused by reflections in the water.

On reaching Elmwood, a small but very pretty village, I landed above the small dam, walked across it and back of the old wooden mill to the main street, stopping at the store and post office to get supplies. I found milk and ripe peaches, and posted a short letter for home, though it never reached there; then back to the canoe (left in charge of a boy), and making a very short carry, pushed off below the dam and floated down under a small, but handsome granite bridge, built with one (half oval) arch, but very strong. A man on this bridge asked where I was from and where bound, and when I replied, "From Brockton to salt water," he said I'd never reach salt water in that egg shell. In one sense he was a true prophet, for I did not reach salt water by way of the Taunton River, owing, however, to my branching off lower down; but that egg shell was in salt water in Buzzard's Bay the same week and behaved as she did everywhere else (except at carries), as well as any boat of her size could. Below Elmwood for several miles the river, about seventy or eighty feet wide, was a fair average stream, with a clear, comfortable current, but no such "park" as above the village. There may be many just such "parks," and I hope to find them, but I don't yet know where to look. That one was unexpected, and it seems to me that in all outing the unexpected is the most interesting.

About 6 P. M. I reached a place where a bridge had been commenced. The side abutments were partly up, and had reduced the width of the river about one-half, and from one to the other a bed of rocks and stones had been dumped in unevenly, making a drop or fall of about a foot where the water ran over them. Not wanting to make a carry, and being anxious to try the canoe and a rapid, even if a tame one, I steered for the apex or V of the rush. All went well and rapidly till I reached the point of the apex, when I ran high up on a hidden rock and stopped, with the water going by and around me rapidly, and the canoe just balancing and treading on the small keel. Reaching the paddle carefully down a slight push against the rock lifted all clear, and the current then took charge again, and staid by till nearly 9 o'clock, when, as it began to grow dark, it lost itself in a rambling pond with low, wooded, swampy shores and many inlets and coves. The current had got lost; even the pond-lily stems bent in different directions. There was no bank in sight high enough to land on, and night was settling down thick. I was sure I was lost, and I wasn't sure how near I might be to a fall or dam. Just as I had determined to tie up to a bush for the night, I heard the sound of people coming my way in a boat, and from them learned the way down stream. Paddling carefully along in the dark, I ran close to a tent-boat bank, on the top of which grew a large oak, which was dimly outlined against the dark sky. Camp No. 1 was at the top of that bank under the oak, and a very tired crew had a hearty supper and rolled into blankets beside the canoe and among mullen stalks.

For several hours it thundered and lightened in the distance, and about midnight the lightning got so familiar with the oak tree that the chance of a soaking seemed preferable to a dose of electricity roughly administered, so the camp (canoe and all) got up and adjourned to the open field; the crew got between decks, covered the cockpit with the rubber blanket and mosquito netting, and slept.

This place must have been very remote from any dwelling, for though snakes runs no sound of cattle, dogs or fowls was heard at midnight or in the early morning. About 4 A. M. the cushion bed grew hard, so the crew turned out for a bath and breakfast. After this launch and paddle of a mile in the dusk of the morning to a long (paper mill) dam, landing on the right bank (the mill was at the left). A very comfortable down-grade carry of some 300 feet ended at an eddy that joined the river some distance below the dam, which latter must have been 400 feet long, and for about 150 feet the water poured over it down eighteen or twenty feet on to rocks, which churned it into hard, lasting foam that floated down the river, which for several miles was about 100 feet wide, with a steady current running between high, heavily-wooded banks. The foam in bunches, many of them as large as a man's hat, floating down stream as far as one could see in the early morning light, gave the impression that the boat was just at the head of a sharp decline, and would the next moment plunge forward into a grand whirl or rapid ahead, much as one with a good sled starts away from the top of a steep coast on a moonlight night. Even in looking back it seemed like looking up hill. Floating along in clear air, first the birds got up, one or two at a time, then the sun, and as the river grew wider and the banks lower, the wind got up and blew the surface of the water clear of foam, and started little dancing ripples in its place.

In passing down among the foam, where the current was steady, much such a stop occurred as at the small rapid the night before, only this time it was a strong stake that caused it, the canoe stopped, the river didn't. Directly under the cushion was one end of a strong stake or branch, the other end solid in the river bed. The balance was so exact that an inch out of perpendicular meant a probable capsize, and it was several minutes before the end of the paddle found just the right place against the side of the slippery stake, and the voyage was resumed.

About 7 A. M., soon after passing under the Old Colony Railroad bridge, I reached the mouth of the Namasket River, which here empties into the Taunton. It is a very rapid stream, about forty feet wide, winding up about six miles to the card mill on the east edge of Middleboro. Along the banks of both rivers, but principally on the Taunton, where the banks were low and marshy, were large quantities of wild hollyhocks growing directly in the water, as seed had floated there and rooted. The plants were not over four feet high, but the blossoms, seldom more than two on a stem, were monstrous, fully twice as large as the largest I ever saw in a garden, while the cardinal flowers far surpassed anything I ever saw in the meadows, spikes eight to ten inches long, of solid perfect blossoms, every petal brilliant and full, almost dazzling in the sunlight and water reflection.

Up the Namasket River, which was a hard paddle except in reaches where the wind was going my way, so that I could sail against the current, I had but one carry to make, and as there were a number of men and boys working and fishing there, all willing and anxious to see and handle the "beautiful canoe," my task was easy and pleasant. Here they knew what a canoe was, though none had ever seen one so complete and handsome.

Arriving at the card mill and being tired I hired a team and took the canoe to the express office, and an hour afterward was aboard a train speeding toward the bay, where the canoe joined me at night, after the most pleasant and beneficial water trip I ever made. The time actually used on the water was from 10:10 A. M. at Brockton, Wednesday, till 10:50 A. M. at Middleboro, Thursday, and the same amount of time used in starting from East Bridgewater, and following the Taunton, would have been much more easy and restful, and is a plan that has haunted me all the wintry days, while snow, ice and slush have made it seem as if summer would never come. I hope to make that trip some time, but if I can't go I can heartily recommend it to others who can. DAD.

IANTHE C. C.—Newark, N. J., July 24.—*Editor Forest and Stream:* The first annual regatta of the Ianthe C. C. will be held on Saturday, Aug. 22, on the Passaic River, commencing at 2 P. M., open to all canoeists. Rules of N. Y. C. C. to govern. Course from Point House ½ mile to and around buoy and return, or 1 mile. Race No. 1, paddling, for single canoes 24in. beam and under; entrance fee 50 cents. Race No. 2, paddling, for single canoes 24 to 28in. beam inclusive; entrance fee 50 cents. Race No. 3, paddling, for single canoes 28in. beam and over; entrance fee 50 cents. Race No. 4, tandem paddling, open to all canoes irrespective of size or beam; entrance fee 50 cents. Race No. 5, sailing, open to all single canoes irrespective of size, class or rig; entrance fee $1. Race No. 6, obstacle, open to all single canoes, the occupant to tumble out of his canoe into the water up to his chin at the discharge of the starting gun, which will occur twice. The prizes will be announced later. All entries must be sent to the Commodore on or before Aug. 6, or they will not be accepted. The boat house is situated on the Passaic River, foot of Grafton avenue, and to reach it take the N. Y. L. E. & W. R. R. to Woodside or any of the railroads to Newark, and take the cars running north to Grafton avenue.—F. A. PHELPS, Jr., Commodore, 140 Lincoln avenue, Newark, N. J.

SHERBROOKE, Quebec, July 25.—The Sherbrooke Boating and Canoeing Club was organized this spring and starts with a 30×60ft. house, twenty rowing and sailing skiffs, five canoes (including she that was the Allegro), and a sneakbox, the whole the property of fifty odd members. While there has always been more or less interest in canoeing here, we have only just begun to appreciate the benefits of organization, and if there are any other canoeists scattered in twos and threes throughout the country who think they can do nothing, tell them about our club, and add that the subject was first agitated by two a year ago. We had the pleasure of entertaining four members of the Harvard Club last month, and will always be glad to see canoeists and those interested in FOREST AND STREAM at all times. —JOS. G. WALTON.

PURITAN.

IF any evidence were needed of the general interest felt by the American people in the defense of the Cup, sufficient would be afforded by the models, designs and suggestions that have poured in from all quarters since the first news of the proposed races. Not only about New York, where yachtsmen naturally feel a strong local interest, but from the lakes and even the interior far from yachting waters have come plans, suggestions and inquiries that bear evidence of a widespread interest in the proper defense of the Cup. Models of all sorts, many of them requiring the expenditure of much time and trouble, have been freely given, and various offers of assistance have been made, which in one notable case have taken a practical and substantial form. The New York Y. C., as direct custodians of the Cup, were in duty bound to provide a suitable opponent for the challenging cutters; and their fleet affording no boats of sufficient size, the club at once took measures to build a large sloop. While every possible care was taken to secure success, there is always more or less uncertainty about a new boat, especially in this case, where the yacht was to be much larger than any sloop built in many years; and it was felt by many that our chances of successfully meeting Genesta would be much greater if there were several yachts to select from in case of the failure of the New York yacht to meet the expectations of her builders, or in the event of any mishap to her; and this feeling, with a desire to do a share of what they looked at as a national rather than local matter, led some of the leading members of the Eastern Y. C., of Boston, to undertake the task of building a second yacht to take part in the trial races, and to be ready if required to meet Genesta or Galatea.

The only party on whom the duty of providing a yacht rested was the New York Y. C., but looking at the matter in its national aspect, and having in view the prestige of American yachting, threatened this year as never before, the Eastern yachtsmen volunteered to provide a second boat for the contests. With the leaders in the enterprise, Messrs. J. Malcolm Forbes and Chas. J. Paine, were associated a dozen other members of the E. Y. C., each contributing an equal share of the expense, the management of the new boat being left largely in the hands of the gentlemen named, two of the most expert yachtsmen in the East. In putting their plan into execution they called to their aid Mr. Edward Burgess, known not only as a thorough yachtsman and skillful sailor, but as the designer of a number of the smaller class yachts so numerous about Boston, in which work he has shown special skill, both in the modeling of the hull and in the economical and tasteful arrangement of the interiors. The problem before these gentlemen was no easy one; given Genesta with her known dimensions and record, to find a yacht of a totally different type and of a size with which American yachtmen are not familiar, which should beat her under a length and sail area rule. Two imperative conditions were imposed by the circumstances of the case, the yacht must be a sloop to the extent of comparatively wide beam and moderate depth, and she must have a centerboard and not a keel only. In other details the designer was untrammeled, and that he has boldly and judiciously exercised the liberty allowed him in the selection of details is shown by the success already attained by the Puritan.

Disregarding the traditions of the old sloop builders and unimpeded by the worship of ideas long since exploded, Mr. Burgess has sought

to incorporate in the new sloop the best points of existing yachts, regardless of their origin. The new boat is not a "representative" sloop in the meaning so long attached to the term; the big jib is conspicuous only by its absence; details of rig are all those of the thorough cutter except the raked bowsprit and laced mainsail; underneath is a heavy lead keel, the plumb stem shows up clean and sharp compared with the long snout covered with gilding, once a prominent feature in American sloops, while worst of all, the stern, instead of being sawed off to a length consistent with ancient traditions and prejudices, flaunts a long jaunty counter, symmetrical, graceful and —"English you know." In the old narrow sense she is far different from the "representative" sloop, but in a broader sense she is thoroughly representative, a representative of American enterprise, progress and ingenuity, both in conception, design and construction. No American yachtsman can object on the grounds that she is not a fitting champion in every way, or that she is unworthy of the task before accomplished by America, Columbia, Magic and Mischief.

Puritan, as the new boat has been named, is a centerboard sloop 80ft. on waterline, 23ft. beam, 8ft. 2in. draft, with a lead keel of 25 long tons, inside ballast of lead cast to fit, 20 tons, and a displacement of 105 long tons. Her frame and planking are of white oak, and her oak keel is a stick 2ft. square, under which is the lead keel, secured with Muntz metal bolts. She was built by Lawley & Son, of South Boston, builders of Adrienne, Rondina, Edna, Fad, Melusina, Medusa, Harbinger, and many other successful yachts, and she is constructed in a thorough manner. She is fitted with a mainmast of Oregon pine, 77ft. heel to head and 18in. diameter, and a standing bowsprit 38ft. outboard and 16in. diameter. Her boom is 70ft. long and 14in. diameter, also of Oregon pine, and her gaff is 47ft. long and 10in. diameter. Her sails were made by McManus & Son, of Boston, the canvas being specially woven for her. The mainsail is of No. 1, 14in. wide, and the foresail of No. 2, and jib of No. 3, the area of lower sails being about 5,000ft. The jib sets flying with an outhaul and traveler, the forestay leads to the stemhead, and the mainsail, though laced, is also fitted with outhaul and traveler. Inside the yacht is neatly and plainly fitted, convenience in working and handling sails, and the comfort of her crew being the main considerations. The deck, of course, is flush from stem to stern, with low hatches and skylights. Outside the Puritan is painted white, the only white sloop or cutter of any size; but even without this help there would be no trouble in picking out her shapely hull and stylish rig anywhere among American yachts.

In one feature more than any other is she a marked departure from American practice, the low position of her ballast for a boat of her beam, and in this feature we believe there lies a strong chance that her performance in a sea will not be satisfactory. Thus far she has been a success in smooth water, a surprise to all; but all experience with smaller yachts tends to show that in boats of less than four beams, with little depth of body, low weights attained by outside keels are detrimental to speed in a seaway. Thus far Puritan has hardly been tested in this respect, and, while we hope otherwise, we do not expect that when out in really rough water she will attain a speed proportionate to that she has shown thus far.

Her record down to date has already appeared in the FOREST AND STREAM; her first performance under sail, her first race on June 30, when she appeared in the Eastern Y. C. regatta, outsailing the fleet, and again in the schooner race, when she sailed in company, beating the others badly to windward. In her own class she has as yet been untried, but wherever she may be placed after trial, there can be no doubt, from her performances thus far, but that she is a very fast boat in any ordinary conditions of wind and water. In a few weeks we shall be able to form a more correct estimate of her merits in her class, and perhaps before the season is over we may see her measured by another standard, that of Genesta. Whatever the result may be, there is no doubt, from what she has already done, but that she will prove a credit to the spirit and enterprise of the gentlemen who built her, as well as to the skill of her designer.

BENT TIMBERS AND YACHT CONSTRUCTION.

Editor Forest and Stream:

I noticed in a recent number of the FOREST AND STREAM a communication from a contributor (Mr. Shephard) on the subject of steamed and bent forms in yacht building. I indorse most emphatically all Mr. Shephard says in favor of their merits. In the course of an experience extending over a period of twenty years, I have tested thoroughly the great advantages of bent oak frames over any other kind, for lightness and strength as well as holding fastening. In San Francisco, where I have had built not less than a dozen yachts, large and small, steam and sailing, by William I. Stone, a most skilful mechanic, the frames were in every instance of bent oak. By using oak frames weight can be reduced at least one-half and strength proportionally increased. In other words much greater strength can be obtained from timbers 2x3 of oak than 4x6 of sawed material or sawed timbers. It is a common error to suppose that heavy timbers and thick planking are essential to strength, and that there is great merit in a heavily built hull. My own experience is quite the contrary. It has been urged that great weight in a hull acts as ballast, a great mistake. A heavily timbered boat is always loggy, dull and seldom a fast sailer, whereas a lightly timbered and planked boat is lively, rides at anchor easily, handles easily, and is buoyant in a sea way. She moves easily, feels the lightest breeze, steers easily if properly sparred, in short, gives perfect satisfaction.

As to enduring qualities, I can give the following as one instance of many that have come under my observation. In 1867, Stone built for me a centerboard schooner, 55ft. over all, 51½ft. deep, 17ft. beam. Her timbers were of white oak 2x3, set 12in. from centers, planking 1½ scant before planing, which reduced the thickness to about 1¼, as she was planed two or three times; fastening, galvanized iron. Everyone acquainted with the Bay of San Francisco can testify to the heaviness and strength of the winds and rough water encountered in yachting. It is, in fact, a rough school for the yachtsman, and a severe test of the staunchness and strength of boats. I used the yacht constantly for five years, during which time she pounded on sand bars frequently, and was often left high and dry for a tide on uneven bottom; in short she had rough usage, during all of which time she never leaked a bucketful; the pump was a useless piece of furniture. After using her as a sailing craft for that length of time, I concluded to lengthen her and convert her into a steam yacht, and did so, and used her that season under steam. Became disgusted with steam and the annoyances consequent in the way of inspectors and the absurd requirements under the law, which should except steam yachts from its ridiculous provisions. I had lengthened the yacht 33ft. forward, but had not increased the size of the frames of the added section, and when I restored her to a sailing yacht, which I did the following spring, she was 88ft. long. The addition of the 33ft. rendered the quantity of sail formerly carried seemingly inadequate and ridiculously out of proportion, but I had a theory that dispensing with ballast would give greater buoyancy and consequently greater speed, so I put back the same spars and sails formerly on her. By lengthening, the stability was of course greatly increased, and I dispensed with one-half the ballast, leaving only about two tons. The result was astonishing; she fairly flew.

In a regatta, the very day she was launched from the ways, after the restoration, she took part and ran away from the fleet easily. She started a half hour after the other yachts had got off, overtook, passed them, and had anchored, furled sails and the boys had had time to get quite jolly over a big bowl of punch before the foremost of the fleet arrived. It was really a wonderful exhibition of speed, which character she maintained. Soon after I sold her, to go to the South Sea Islands. The old salts shook their heads and said she would never get there, and that she was unsafe to cross the bar; nevertheless she sailed on her voyage. Her first port was Honolulu. A crack pilot-boat, the Fanny, was bound to the same port, and a little side bet of $500 was offered that she would beat the yacht down. It was accepted. The yacht encountered rough weather, the pilot-boat's best play, but nevertheless she beat the pilot-boat 48 hours, making the run of 2,100 miles inside of 9 days, calm and trade winds inclusive. From Honolulu she sailed for the Navigators, and made the most remarkable sea time of 9 miles per hour average from the day she left San Francisco until the voyage terminated, over 5,000 miles. She was afterward used in voyages among the islands, beating up in a rough sea against strong trade winds, carrying all sail when other vessels had in double reefs, and until the day she was lost on a reef, nearly two years later, she never leaked a barrel of water. I would mention also that during this whole period of service she had a deep, open cockpit and never shipped a sea. So much for the theory that it is unsafe to venture outside with a low cockpit; but in this case I attribute the immunity from "combers" and occasional "toppiers" to her buoyancy, for she was like a cork on the water. While at Upolo, Navigators Islands, an English yacht of much heavier tonnage came over from the Fijis and challenged the Peerless for a race twenty miles to windward. The English craft was a deep, sharp keel, drawing nearly 12 feet of water. The Peerless drew 4 feet and sailed under jib and mainsail only, and before they had gone ten miles the Peerless had sailed around her twice. The English yacht gave it up and paid the money.

I take no credit to myself for the speed this vessel developed; she was an accident; but it goes to show and prove the principle that light construction, good material, good work, thorough fastening, light spars, moderate sail and absence of heavy ballast give buoyancy, and buoyancy great speed. It may be asked how will it work in heavy weather? The question is easily answered: Reduce sail correspondingly. The one great error in yacht sparring is over-sparring, requiring heavy ballast to make them stand up. The idea seems to be the more sail you pile on, the greater speed. The craft is over-pressed and buries, whereas by reducing sail greater speed can generally be obtained; more sail requires more ballast; more ballast more sail, and so it goes on until the boat is overloaded and over-taxed with both. In light winds she is lazy and heavy, and in heavy winds she is wet, hard to manage and requires a double crew. Our experience in California is that the lighter the spars the better, and let the rigging do the work. The leverage aloft of a heavy pitch pine mast is very great. Every pound you can lighten up in mast and upper spars leaves your sail-carrying capacity so much greater.

Another very great advantage to be gained in boat and yacht building is derived from thoroughly painting every timber in the frame when set up, and also the planking ceiling on both sides, and the more coats the better, as it keeps the wood from water-soaking, keeps your boat light and buoyant and preserves it from decay. I know boats that have been in use for twenty years, in which when overhauled and lengthened, the wood was as sound as when put in. Build your boat of dry material, paint well and there will be no rot.

It is not necessary to use even dry oak for frames, if you are going to steam and bend, as the steam drives out the sap, and timbers of small size will season in a few days if exposed to the air and wind. If you want a good boat and a durable one build her of light bent white oak frames, plank lightly, fast in thoroughly, have your spars as light as possible, of spruce if you can obtain it, paint every piece and timber as you build. Heavy planking is a mistake. If you strike a rock you are bound to knock a hole in your craft, whether your planking is two inches or one, sharp pointed rocks are not particular, they will do your business in either case effectually. In the next chapter I will talk to you a little about the yawl rig. PODGERS.

YACHT RACES ON LAKE ERIE.

CLEVELAND Y. A. REGATTA, JULY 16.

This season the proposed meet at Put-in-Bay has stirred up lake yachtsmen, and efforts have been made to make the regattas more than usually attractive. The chief workers in the matter of the meet, the Cleveland Yachting Association, invited all lake yachts to their regatta at Cleveland, on July 16, offering handsome prizes, and also made arrangements for a sail to the rendezvous at Put-in-Bay. The yachts were to sail over a course of 20 miles for first and second and 15 miles for third; the first course starting from the pier off Cleveland, thence N. E. 5 miles, W. 5 miles, S. W. 5 miles and E. 5 miles. The shorter course returned direct from the second mark. The classes were: First, yachts 35ft. and over on waterline; prizes, Gardner Challenge Cup and first prize, $75, second prize $50; entrance $10. Second class, yachts of 25ft. and under 35ft.; first prize, the Association Challenge Cup held by the Fanchon of Put-in-Bay, and $50, second prize $40, third prize $20, fourth prize $10; entrance $5. Third class, yachts under 25ft., first prize $25, second prize $10; entrance $3. Entries were open to all yachts on the lakes, under the C. Y. A. rules. The time limit was six hours. No shifting nor starting of ballast allowed. Twelve yachts started on Wednesday morning in a very light wind which continued all day, making almost a drift. The full times of the race were:

	Length.	Start.	Finish.	Actual.	Corrected.
FIRST CLASS.					
Cora	51.04	10 35 00	4 01 00	5 26 00	5 05 06
SECOND CLASS.					
Fanchon, Put-in-Bay	33.02	10 30 00	3 37 45	4 58 45	4 09 32
Kate Graham, Toledo	31.08	10 32 45	3 51 45	5 19 00	4 27 18
Scud, Toledo	35.01	10 32 15	3 54 45	5 22 30	4 35 54
Osprey, Toledo	33.10	10 35 00	4 09 30	5 35 30	4 46 48
Daisy, Cleveland	26.09	10 35 00	4 31 00	5 56 00	4 55 30
Com. Gardner, Clev'd	23.05	10 35 00	4 45 00	6 10 00	5 02 14
Lulu, Cleveland	30 09	10 33 15	4 36 15	6 03 45	5 10 53
Oberon, Toledo	34.08	10 33 00	4 36 00	6 03 00	5 15 50
Ida, Cleveland	33 06	10 35 00	Distanced.		
C. J. Minnett, Sandusky	34.08	10 35 00	Distanced.		
Rover, Cleveland	35.08	10 35 00	Carried away masthead.		

After the race the squadron sailed for Put-in-Bay, where nearly 50 yachts anchored over Sunday, coming from the various lake ports. On one side of this beautiful little harbor is an island, Gibraltar, on which is the handsome stone residence of Mr. Jay Cooke. This island partly shuts in the harbor and makes an excellent anchorage. The classes were the same as in the Cleveland race, with the Herreshoff table of allowance, one fifth overhang only being measured.

The first class prizes were a silk flag presented by the citizens of Put-in-Bay, and another by the C. Y. A., also ⅓ of all entrance money; second prize, ⅔ of entrance money; entrance $10. Class II., silk flag by C. Y. A. and solid silver cup, presented by citizens of Put-in-Bay, with ¼ of entrance money; second prize, four-ninths of entrance money; third prize, two-ninths of entrance money; entrance, $3. Class III., silk flag presented by C. Y. A. and half of entrance; second prize, four-ninths of entrance; third prize, two-ninths of entrance; entrance, $3. The courses were for first and second classes, from a stakeboat off Rattlesnake Island, N. W. W. 7 miles to stakeboat, thence S. W. ½ S. 7 miles to stakeboat, thence E. ¾ S. to finish, 21 miles. Third class yachts only round the first boat and return, 14 miles. All marks were to be left to port, 10 minutes were allowed to start in, times being taken as the yachts crossed. The Regatta Committee were Messrs. H. D. Cuthinberry, W. Scott Robinson, R. E. Mix, Fred. Brewster, H. G. Phelps.

Tuesday morning was clear and calm, there being very little wind. Twenty-five yachts started when the signal was given at 11:11 A. M. Scud leading over the line, followed by Fanchon, Wanderer, No Name, Cora, Mischief, Vixen, Alert, Maud S., Ripple, Oberon, Kate Graham, W. J. Partridge, Osprey, Cora V., Jennie J., Crescent, Tidal Wave, Petrel, Lulu, S. H. Ives, schooner; Louise, schooner; Stella, Madelline and Mazeppo, to latter two being handicapped. To first mark was a broad reach with a very light wind, most of the yachts carrying balloon jibtopsails, while Cora, Fanchon, Stella, Ripple, Lulu and Cora V. all tried spinnakers to port, set well forward. The Cora, Kate Graham and Alert all carried water sails hung from their booms. When a mile had passed the wind came fresher, while a squall showed up in the West, a signal at which kites came in and some topsails were doused. Over the rest of the first leg the squall came down at times with great force until some were glad to lower everything in a hurry, while others turned in one or two reefs. Cora lowered her mainsail and set it again, then turned in two reefs a few minutes later. Fanchon's crew did excellent work in reefing, and in fact showed the value of thorough drill in the way they handled their boat all day. Within a quarter of an hour after the worst part of the squall all reefs were out again, and from that time out there was little wind, and the race was a drift in. Cora winning easily in 2.33:35 corrected time. The full times were:

	Length.	Start.	Finish.	Actual.	Corrected.
FIRST CLASS.					
Cora, Cleveland	51 04	11 16 00	2 19 12	3 04 02	2 33 35
W. J. Partridge, Det.	35.11	11 17 36	3 24 55	4 07 20	3 19 39
S. H. Ives, Detroit	55.00	11 19 15	3 21 52	4 02 37	3 35 06
Louise, Detroit	56.06	11 19 25	withdrew.		
SECOND CLASS.					
Fanchon, Put-in-Bay	33.02	11 14 06	2 35 22	2 22 22	2 30 32
Scud, Toledo	35.01	11 13 00	2 55 50	3 42 50	2 53 54
Oberon, Toledo	34.08	11 17 05	3 16 15	3 59 10	3 03 29
Osprey, Toledo	33 10	11 17 40	3 12 58	3 55 18	3 04 31
Alert, Sandusky	29 08	11 15 40	3 22 59	4 07 19	3 09 32
Cora V., Put in-Bay	31.04	11 18 05	3 22 47	4 04 42	3 09 51
Stella, Toledo	31.02	11 19 40	3 27 25	4 07 45	3 12 38
Crescent, Toledo	27.09	11 18 13	3 48 58	4 16 45	3 15 17
Jennie J., Detroit	30.04	11 18 13	3 34 10	4 15 57	3 19 21
Petrel, Detroit	33.02	11 18 55	Not timed.		
Lulu, Cleveland	30.09	11 19 10	Withdrew.		
Kate Graham, Tol.	31.08	11 17 10	Not timed.		
THIRD CLASS.					
Madeline, Detroit	21.02	11 22 00	1 24 32	2 02 32	1 11 05
Tidal Wave, Kelley Island	17.08	11 18 13	1 19 02	2 10 49	1 11 50
Maud S., Kelley I'd.	18.00	11 16 45	1 27 30	2 10 45	1 12 32

Ripple, Put-in-Bay	19.02	11 16 55	1 37 04	2 20 09	1 24 37
Wanderer, Middle Bass Island	16.07	11 15 00	1 41 30	2 26 30	1 24 46
No Name, Put in Bay	19.00	11 15 08	1 40 10	2 25 02	1 29 08
Mischief, Put-in-Bay	18 00	11 15 11	Withdrew.		
Mazeppa, Put-in-Bay	23.04	11 22 00	Capsized.		

Besides the racing yachts the steam yacht Twilight, a little side wheel boat of steel, Lillie, of Toledo; and Cyclone and Winnifred, of Cleveland, were present. In the evening the yachtsmen were all at the ball at Wehrle's.

On Wednesday some sailed for home, while quite a number laid in the harbor or at Ballast Island, where they could view the canoe races. On Wednesday evening, the crews of all the yachts met at the Beebe House, at Put-in Bay, and prizes were presented. Vice-Com. Rhodes, C. Y. A., presided, with Mr. Williams as secretary of the meeting. In Class I., Cora took two very handsome silk flags and $10; second prize, W. J. Partridge, $27. In Class II., Fanchon took first, a silk flag, a silver cup and $20; Scud took second, $27, and Oberon third, $13. In Class III., Madeline took first, a silk flag and $20; Tidal Wave second, $14, and Maud S. third, $6. Com. Hart, of the Michigan Y. C., addressed the meeting, urging the importance of forming an association of lake yachtsmen, and on his motion, a committee of 7 was appointed to consider and present to a subsequent meeting a plan of organization. This committee included Messrs. Williams and Downie, of Cleveland; ex-Com. Baker and Mr. McLoud, of Detroit; Hepburn and Ketcham, of Toledo, and Gast, of Put-in-Bay. After their appointment the meeting adjourned, the committee to meet on the flagship Louise on Thursday evening.

The main event on Thursday was a race between pound boats, the local fishing craft of the lakes, a sort of primitive second cousin to a sharpie. These boats are flat-bottomed, straight-sided, with high freeboard and light draft, with centerboard and balance rudder. The rig is very peculiar, two masts stepped as in a sharpie, the sail laced to the boom, and at the height of the gaff in an ordinary sail a batten is placed, fitted with jaws as a gaff. Above this batten the sail extends in a triangular shape like a topsail, the sail being in fact a mainsail and topsail in one. No peak or throat halliards are used, simply a "topsail" halliard rove through the masthead and fast to the upper cringle. By this the sail is hoisted, and when it is cast off it comes down at once. It sits flat and is very simple and easily handled, and the fishermen sail them very skillfully. The course for these boats was from Put-in-Bay around Green, South Bass and Ballast Islands, finishing at start, 16 miles. The prizes were $20, $15, $10 and a keg of beer. The four boats starting were owned by Johnson, Sikes, Miller and Parker, a fifth boat that was entered withdrawing. The start was made at 10:35 A. M. One boat carried a borrowed balloon jibtopsail belonging to a yacht, and one improvised a maintopmast staysail out of an old blanket. The wind was light but steady. Johnson's boat finished in 5.43, Sikes 5.48, Parker 6.18.55, Milller 6.21.50.

At 7 P. M. the committee met in the cabin of the Louise, Mr. C. H. Walker taking the place of Mr. McLeod in the latter's absence. Mr. J. S. Williams presided, with Mr. G. H. Ketchum as secretary. The outlines of the constitution of the Interlake Yacht Association, for the encouragement and advancement of yachting on the northwestern lakes, were prepared to be submitted to the various clubs interested for their approval and suggestions on measurement and similar points. The Association will be open to any yacht club on lakes Ontario, Erie, Huron, Michigan, and connecting rivers, having on its register three or more yachts of 18ft. or more measurement and a roll of ten members in good standing, on a unanimous vote of the clubs in the Association, the entrance fee being $10. Commodore Gardner was chosen as Commodore of the new association, with Commodore Hart, Michigan Y. C., as Vice-Commodore, and Commodore A. W. Mochen, Toledo Y. C., as Rear-Commodore. Mr. J. S. Williams was chosen Secretary and Treasurer. After the meeting a display of fireworks from the yachts followed, with a supper for the yachtsmen and canoeists at the Beebe House later on. On Friday most of the yachts left for home.

The association is now well on the way to a permanent establishment, with the hearty support of the yachtsmen of Cleveland, Detroit, Toledo and Put-in-Bay. Next year a cruise and regatta will be held at Put-in-Bay, and there is no doubt but what the other sailors of Lake Erie will come in shortly. With Commodore Gardner at Cleveland, and Commodore Hart at Detroit, both active and enthusiastic yachtsmen, the interest in the matter will not be allowed to flag, but the association is sure of a steady growth. On Tuesday next the Toledo Y. C. will sail their third annual regatta, a number of very handsome prizes being offered.

BEVERLY Y. C., JULY 25.

A FRESH S.W. wind was blowing on the morning of the race, but toward noon the wind lightened and heavy rain clouds appeared in the west. Precisely at noon the preparatory gun was fired from the flagship Foam and five minutes later the first class was sent off. Gem crossed the line almost at the flash, closely followed by Atalanta and Eugenia, while Countess and Expert were caught some distance up the harbor and lost some three minutes. Their course lay out to Half-Way Rock with the wind well aft on starboard quarter. Gem and Expert set balloon jibtopsails, while Atalanta, Eugenia and Countess sent out spinnakers. Eugenia crawled on Gem and established an overlap, and in rounding the harbor buoy Gem refused to give way and a collision occurred; cross protests were filed and decided in favor of Eugenia.

After rounding the rock they ran to Southeast Breakers, then jibed and had a beam wind to Gale's Ledge, a closehaul to Bowditch's Ledge and a beat home across the harbor. The breeze was quite fresh over the whole course, and the 16½ miles were made in good time.

In the second class Peri, Spider and Witch went over promptly; Fad was close to line, but on wrong tack and lost time in jibing, while Caprice was late.

In third class Mr. Charles J. Paine's new keel catboat put in an appearance for her maiden race. She has not yet been named, but around the club house she is commonly dubbed the Little Puritan from some fancied resemblance to the large boat of that name. She was modeled by Mr. Edward Burgess and built by Lawley, the builder's measurements being 18ft. waterline, 7.6 beam, 4 draft, with a lot of lead on her keel, being in fact a cat-rigged cutter. She led off in this class, being closely followed by Bluebell, Psyche some way astern.

As the boats ran in toward the Beverly shore round buoys 3, 5 and 7, Peri and Spider led close together, then Witch, Puritan some way astern, with Bluebell a couple of hundred feet astern, then Fad and Psyche, with Caprice bringing up the rear. As the Curtis Point stakeboat was neared, the leaders ran into a calm and all bunched together, finally rounding stakeboat in an eastern puff close together as follows: Peri, Spider, Witch, Bluebell, Puritan, Psyche, Fad and Caprice.

All tacked in under the shore, then off into a calm spot. After a while Peri and Spider worked through into an S. W. breeze on starboard tack. Witch got out on port tack, took S. W. breeze and tacked for Bowditch's Ledge Beacon.

After some minutes Bluebell and Psyche got the breeze and went off scupper down, Bluebell ¼ of a mile ahead, leaving the others in a stark calm. Caprice got it after a while, but Puritan and Fad were more than a mile behind Psyche when it struck them.

Spider reached the beacon first, then Peri and Witch, the latter putting her bowsprit through Peri's sail, tearing it to pieces, forcing both boats to lower away and finally sending Peri back to Beverly a wreck. Witch protests Peri and Peri Witch, which cannot be decided for a few days. By this time Atalanta, closely pressed by Countess, had rounded the beacon, then came Gem, and immediately after Bluebell rounded one way as expert went round the other.

Here the former got into trouble through a misunderstanding of orders; the crew started to trim down sheets for the starboard tack as the skipper put down helm to go about on port tack. The result was that she went in irons close to the beacon, and had to be forced back on starboard tack to avoid touching it. This took much time, and Psyche slipped by during the operation, while Puritan, going very fast, was getting dangerously close. In the meantime Witch had got off again ahead of Psyche. On the beat up Puritan showed great speed, outpointing and outsailing Psyche and passing Bluebell easily. Fad also did well, gaining some six minutes in the beat.

	Length.	Actual.	Corrected.
FIRST CLASS.			
Atalanta, sloop, I. R. Thomas	29 07½	2 15 18	2 07 33
Countess, sloop, Geo. B. Chase	31 06	2 25 25	2 19 19
Gem, sloop, H. W. Savage	26.09	2 30 46	2 20 11
Expert, sloop, L. Whitcomb	24 09	2 31 26	2 18 38
Eugenia, cat, I. S. Palmer	28 03	2 33 17	2 23 13
SECOND CLASS—CENTERBOARDS.			
Spider, cat, Walter Abbott	20.00	2 30 03	2 16 22
Peri, cat, Henry Parkmay	20 07	Disabled.	
SECOND CLASS—KEELS.			
Witch, cutter, B. B. Crowninshield	23.06	2 30 20	2 19 12
Fad, yawl, Geo. A. Goddard	22.00	2 39 12	2 27 35
Caprice, sloop, John B. Rhodes	19.11	2 45 28	2 31 41
THIRD CLASS.			
Psyche, cat, H. M. & P. S. Sears	19.14	2 25 50	2 11 23
Not named, cat, C. J. Paine	19.06	2 28 16	2 14 00
Bluebell, cat, W. Lloyd Jeffries	18.07	2 33 45	2 18 25

If protest is decided in favor of Witch, prizes go as follows: Atalanta, Spider, Witch and Psyche first prizes; Expert, Fad and Mr. Paine's boat second prizes. Atalanta takes pennant, tieing Expert; Spider and Psyche take and hold pennants. If Witch is ruled out, Fad and Caprice take prizes in that class. Judges—John Dane, Geo. L. Peabody and Arthur W. Wheelwright. Judges' yacht, Foam, B. Y. C.

LAKE ONTARIO AND BAY OF QUINTE.

Editor Forest and Stream:

The yachtsmen of Ontario and the Bay of Quinte are, at the time of writing, busily preparing for the series of matches which are to be held by four out of the five clubs comprising the Lake Yacht Racing Association, the first of which, namely, that of the Royal Canadian Y. C., will be held at Toronto, on the 30th inst. The B. Q. Y. C. will be represented by the big Atalanta in the first class and Iolanthe in the second class. Both craft are now on their way and ought to win in their respective classes. Our fleet would be more largely represented at Toronto, but for the length of the journey. Fifteen miles west of here is a narrow neck of land which separates the Bay of Quinte from Lake Ontario. This necessitates a trip of about 50 miles eastward to the lake, thence south 15 miles, thence northwest a long distance around the peninsula of Prince Edward, the coast of which is dangerous even for small craft, there being no harbors and the wind generally blowing on it from the southwest. As, however, a canal is now being dug through the isthmus, and as it will probably be finished next year, the trip to Toronto will then become quite easy of accomplishment.

At Oswego, on August 4, the bay fleet will have two additional second class representatives in the Gracie (Commodore Roy) of this

port, and the Surprise, of Trenton. At Kingston, on the 7th, ex-Commodore R. J. Bell's well known sloop Norah will be added to the racers in the first class, and here on the 12th the cutter Sylvia will make another addition to the second class. The circuit will wind up here, let us hope, in a blaze of glory.

The only race of the season so far was a little affair over a 3-mile course here on the 22d inst. The wind was very light. There were three starters, namely, Iolanthe, Gracie and Surprise, of Trenton. The race was sailed without time allowance, and the Iolanthe won by 2min. 39sec., while the Gracie beat Surprise by 16sec. Neither of the cutter craft was in racing trim.

The Gracie, which was rebuilt and remodeled last year, appears to have been considerably improved. The cutter Sylvia, which has also been rebuilt, promises to be more speedy than heretofore. Her meeting with the other craft, and especially with Commodore Mott's (Oswego Y. C.) cutter Cricket, will be looked forward to with interest. Meantime all the lake yachtsmen are deeply interested in the cutter Genesta, and look to your columns for full information as to her doings. PORT TACK.

BELLEVILLE, July 27.

PILGRIM.—*Editor Forest and Stream:* The little sloop for Dr. Winslow will be called Pilgrim, and will fly the South Boston Y. C. flag. She is calked and received first coat of paint Saturday. Cockpit floor high, 6in. below deck, giving lots of room below deck. Transoms run aft underneath floor, dead lights in deck aft, water tank under cockpit floor. She looks very fair and gives promise of speed, although only a cruiser. Mast 25ft. heel to truck, 6in. diameter, gaff 13.6, boom 21ft., bowsprit 11ft. outboard, hoist mainsail 15ft., patent blocks, folding boat, grating between transoms for cushion, 3,310 outside.—E. L. W.

GREENWICH Y. C., JULY 27.

Editor Forest and Stream:

The following-named yachts started in the Greenwich Y. C. regatta on the 25th inst., at 11:30 A. M.: Class II., sloops Nymph, Adelina and Eleanor. The last-named being of the Oyster Bay Corinthian Club, present by invitation. Class II., catboats 17ft. long and over, Brahmin, Zelda, Wanda, Telephone. Class III., catboats under 17ft., Jennie, Flirt, Louie Belle. The course sailed was for Class I. and II., from Greenwich Harbor to Matinicock Point and return. For Class III., starting from the same place to make the circuit of the Captain's Islands twice.

The start was fine, and very pretty work was shown for about an hour, when a squall struck the fleet with great violence. Nymph's topmast was carried away and throat halliards parted. Adelina tried to carry sail too long and finally had to cut halliards to lower sail quick enough when the wind struck her. Telephone parted peak halliards. Zelda took in all sail and came to anchor. Jennie had already run to shelter. Flirt anchored in lee of Captain's Island. Brahmin kept on her course under shortened sail, and Wanda never flinching carried all her canvas right through the blow. Zelda soon followed Brahmin, having reefed down closely, and as the squall cleared away they found themselves in the wake of Eleanor, all running down to Matinicock buoy right in the teeth of a roaring southwest gale, such as craft of their kind do not often venture to face.

Wanda had been blown two miles off her course. Adelina, on the approach of a second squall, hove to, so there were but three left in the race. The running of Brahmin and Zelda was, however, of so exciting a nature as to atone for the absence of the rest. Commodore Rendle shook the reefs out of Brahmin's sail right in the face of the squall and rushed down toward the buoy like an express train, while Capt. Asten did the same for the Zelda, and gradually gained not only on Brahmin but on Eleanor. Those who witnessed the race were much surprised at the plucky sailing of the two catboats. The finish was as follows:

	Elapsed.	Corrected.
Eleanor	4 44 29	4 43 37
Zelda	4 47 05	4 46 13
Brahmin	4 47 38	4 47 38

Adelina and Wanda both finished an hour later. Louie Belle was the only one to finish in her class. Thus ended the regatta of the youngest yacht club on the Sound. The judges were Messrs. J. W. Miley and John M. Tracy. LANDSMAN.

COLORS AT HALF MAST.—Seawanhaka Corinthian Y. C. General Orders No. 2, Flagship Bedouin, New York Harbor, July 23, 1885: Out of respect for the death of General Grant, yachts will half-mast colors while at anchor for 30 days from this date. By order of the commodore.—C. C. DEMING, Fleet Captain S. C. Y. C.

ANSWERS TO CORRESPONDENTS.

G. D. L., New Jersey.—Use kerosene and a wire scratch brush; then use gun-oide.

W. E. J., Massachusetts.—You cannot surely tell a dog's age by his body and condition of teeth.

J. J. C., New Haven.—Rub on every day or two some of the grease that exudes from wagon axle. Rub it in well with the fingers.

M. H. G., Rockville, Conn.—Is the helgramite, or dobson, poisonous to handle? I have used them with bare hands, but have been told that they were poisonous if they bite. Ans. They can pinch hard, but are not poisonous. We have often been bitten by them.

DEAFNESS its CAUSES and CURE, by one who was deaf twenty eight years. Treated by most of the noted specialists of the day with no benefit. *Cured himself* in three months, and since then hundreds of others by same process. A plain, simple and successful home treatment. Address T. S. PAGE, 128 East 26th St., New York City.

SELECTED PATTERNS FROM ABBEY & IMBRIE'S

Standard American Trout and Bass Flies.

Named and Numbered, with full description of material, color, etc.

Extract from FOREST AND STREAM.—"Useful for reference."
Extract from *American Angler*.—"The most accurate and otherwise satisfactory plate of American trout and bass flies that has yet been offered to the angling brotherhood."

The two points that have been kept constantly in view in making this selection are: First, the presentation of flies which are well known and highly approved by our most experienced anglers. Second, the selection of flies that are typical, that is, such as represent classes to which the great majority of really good flies can be referred.

PRICES:

In Black and White	25 cents per copy.
With Flies Colored by Hand, by W. Holberton	$1.25 "
Same as above, on extra wide paper, suitable for framing	2.00 "

CANOE HANDLING.
By C. B. VAUX ("DOT").

A complete manual for the management of a canoe. The author begins at the very beginning, describes and explains the rudiments in the simplest and plainest way possible. Everything is made intelligible for beginners; and besides this A B C teaching there are so many hints and wrinkles that the oldest canoeist afloat will find pleasure and profit in the study of these. The book is complete and concise—no useless duffle between its covers. The subjects treated are the choice of a canoe, paddling, sailing, care of the canoe, recipes and rules. The text is further elucidated by numerous practical drawings, and the beauty of the book is enhanced by the many ornamental vignettes. Pages 168; uniform with "Canoe Building." Price, postpaid, $1.00.

NEW YORK: FOREST AND STREAM PUBLISHING CO., 39 Park Row.
LONDON: DAVIES & CO., 1 Finch Lane, Cornhill.
NORRIE & WILSON, 156 Minories, E. C.

PREJUDICE IS A THIEF,
And will rob you of many good things.

Our cigarettes are as fine as can be produced. They have lately been improved, are not hard nor dry. Will always smoke free and moist. Will not crumble in the pocket nor "catch you in the throat." If you are not opposed to a change and cannot obtain them of your dealer, send to the manufacturers for a sample.

Enclose Three Red Stamps. **WM. S. KIMBALL & CO., Rochester, N. Y.**

"FOREST AND STREAM SERIES."

DEER HUNTING.

BY JUDGE JOHN DEAN CATON.

BY and by it will be time to hunt antelope and deer. It is always time to read about them. Judge Caton's book on the antelope, elk, deer, moose and caribou of America discusses in a readable way the life history of these animals and the methods of their capture. It is the work of an enthusiastic sportsman who has had a wide experience and has devoted the leisure of years to studying these interesting game animals. The volume is very fully illustrated, and is a perfect storehouse of information and entertainment. The first edition was sold by the Boston publishers at $4. Price $2.50.

WOODCRAFT.

BY "NESSMUK."

A COMPACT pocket handbook of condensed, boiled-down, concise, clear, comprehensive, sensible, practical camp gumption. "Nessmuk" has been "in the woods" in Michigan, New York, Pennsylvania, and South America, and this is a book for outers, wherever they kindle their camp-fire. The author believes in "smoothing it." He has learned how; now he tells others. It is much easier to learn from "Nessmuk" than from Dame Experience. We should not be surprised if "Woodcraft" completely revolutionized the methods of camping out. If you are going to the woods, read "Woodcraft" before you go. It may add to your trip a hundred fold. Price $1.00.

DOG TRAINING.

BY S. T. HAMMOND.

HE was a promising puppy, and when you turned him over to the breaker to be educated, you thought he was bound to make "the best dog in the world." And you'll not soon forget how disappointed and disgusted you were when the dog, the breaker and the big bill—all three turned up together, and you saw that the animal's spirit was broken and it would take a steam calliope to make him mind. Now, this could not have happened if you had been wise enough to buy a copy of Hammond's book, and in your odd leisure moments *train* the dog yourself instead of having him *broken* by some one else. We are selling edition after edition of this book, and it is revolutionizing the system of preparing dogs for work in the field. Price $1.00.

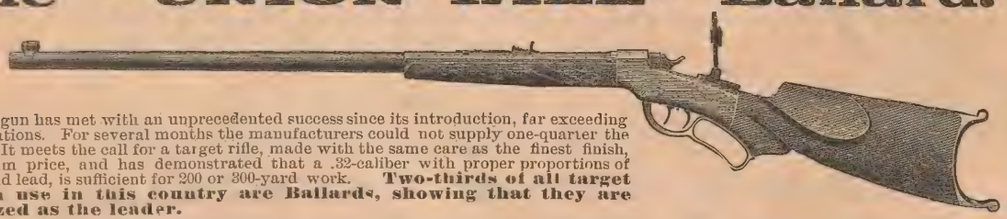
SHORE BIRDS.

A PAMPHLET for those who "gun" along the shore. Tells of: I. Haunts and Habits—Where the bay birds live and what they do at home. II. Range and Migration—Where they go to breed and where to spend the winter. III. A Morning Without the Birds—An episode of shore shooting. IV. Nomenclature—A list of our American species of *Limicolæ*, with a description of each specie-. V. Localities—Where to go to shoot them. VI. Blinds and Decoys—How to shoot them after you have reached the grounds. 45 pp., paper. Price 15 cents.

ANGLING TALKS.

BY GEORGE DAWSON.

AS a political writer of conceded power, Mr. Dawson wielded a trenchant pen; when he turned from the conflict of parties to the praise of the favorite pastime of "simple wise men," his essays, limpid as the crystal streams, are aglow with the soft summer sunlight and melodious with the songs of birds. When angling was the theme, he wrote from a full heart and in closest sympathy with the scenes and pursuits described. These "Talks" are brimful of manly, wholesome sentiment; there is in them all not a particle of cant. Their sincerity and overflowing spirit at once win the reader, and he perforce shares the author's enthusiasm. The effect is magical, like that of the mimic players in Xenophon's *Memorabilia:* he who reads, if he be an angler, must go a-fishing; and if he be not, straightway then must he become one.—*Extract from Publishers' Preface.* Cloth, price 50 cents.

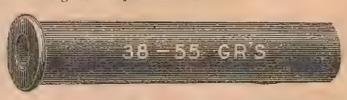


CANOE "AURORA."

BY DR. C. A. NEIDÉ.

A CHARMINGLY written and always entertaining account of a canoe cruise from Lake George, New York, down the Ohio and Mississippi Rivers to the Gulf of Mexico, by the Secretary of the American Canoe Association. To read the cruise of the "Aurora" is the next best thing to having made it; and the reading is decidedly more pleasant than would have been participation in some of the misadventures related. 216 pp., cloth. Price $1.00.

Any of the above books can be obtained in London of Davies & Co., 1 Finch Lane, Cornhill.



The "UNION HILL" Ballard.

This gun has met with an unprecedented success since its introduction, far exceeding all expectations. For several months the manufacturers could not supply one-quarter the demand. It meets the call for a target rifle, made with the same care as the finest finish, at a medium price, and has demonstrated that a .32-caliber with proper proportions of powder and lead, is sufficient for 200 or 300-yard work. **Two-thirds of all target rifles in use in this country are Ballards, showing that they are recognized as the leader.**

Prices: No. 8.—Half Octagon Barrel, Pistol Grip Stock, Cheek Piece, Nickeled, Off-Hand Butt Plate, Double Set Triggers, Graduated Peep and Globe Sights, 9½lbs., 28 and 30 inches $37 50
No. 9.—Same, but with Single Trigger 33 00
Can be furnished with Vernier's Mid-Range and Wind Gauge Front Sights for $6.50 extra.

EVERLASTING SHELLS, 32-40, Cts. Each.

ALLEN'S DECOY DUCK FRAME—Is a simple device for holding the dead duck in a natural position in the water. Price $4 per doz. **SEND FOR CATALOGUE FREE.**

Hornbeam Rods

A SPECIALTY.

W. HUNTINGTON,

WILTON, CONN.,

Makes a specialty of the manufacture of FINE HAND-MADE RODS of Hornbeam for fly fishing. Every fly-fisher should have one of these rods, for whatever preference he may have these are the only thoroughly reliable rods, secure against breakage and capable of real hard usage. With one of these rods a sportsman may venture into the woods for a season and take no other rod, and be fairly sure of returning with it in a serviceable condition. As made from wood of my own cutting and seasoning, they are powerful, easy in action and full of endurance. For circular send to WALLACE HUNTINGTON as above.

3-Piece Fly Rod, Brass Click Reel,

100ft. Linen Trout Line. 6 Flies, 6 Hooks to gut and Leader, complete, by express, $4.50; by mail postpaid, $5.00. 3 Sample Flies, by mail, 25 cts. CANOE

THE FOREST AND STREAM began a year ago the publication of a series of papers on canoe construction, by Mr. W. P. Stephens, of the New York C. C., widely known as an expert on canoe design and building. These papers, having appeared through the year in our columns, have since been rewritten, and with numerous additions are now published in a handsome volume under the title of "Canoe and Boat Building for Amateurs." Mr. Stephens is peculiarly fitted for the preparation of such a work, beginning as an amateur, and having after a long experience of the difficulties attending a learner, taken a prominent place among canoe builders, due both to the model and workmanship of his canoes. Realizing fully the difficulty of explaining to a novice an art in itself far from easy,

AND

and with which he is entirely unfamiliar, the book begins with a description of the various classes of canoes in general use, with their main features and dimensions, and definitions of the terms used in connection with them. Numerous examples of canoes are given, and in connection with them, such plain instructions in designing as will enable the beginner to select intelligently the proper craft for his pur-

BOAT

pose, and to plan her dimensions, details and fittings. To this end designs of all classes of canoes are given, with full dimensions and details. The object has been not merely to enable the tyro to build one boat as described, but to teach him the principles of designing and building in such a way that he may construct such a craft as he desires, following the chapters on designing, the construction of a canoe is taken up in detail, the tools and appliances being first clearly described, as well as the various materials, after which follows the actual work of building. Every operation is taken up in order, from the selection of the keel to the varnishing of the finished boat, and illustrated with numerous diagrams.

A chapter on sails describes all the varieties in use by canoeists, down to the new Mohican settee, with directions for making, rigging and measuring them, while the method of proportioning the sails to the boat is clearly explained, all the calculations

BUILDING

being worked out in detail. The many minor points of a canoe, paddles, steering gears, rudders, aprons, and camp outfit are also described at length, while a chapter is devoted to canvas canoes.

The subject of boat building is fully treated, a rowboat of the usual construction being taken as an example, and described in all its parts in such a manner as to make clear the principles involved, and their application to any form of boat, either lapstreak or carvel build. Each of the numerous technical terms belonging to the subject is defined clearly when it first occurs, and as the index is full and complete, the book is in itself a glossary.

In addition to the numerous diagrams in the body of the work, twenty-four large plates are printed on bond paper, containing the working drawings of canoes for paddling, sailing, cruising

FOR

and racing, with their sail plans, rowing sailing boats, large canoe yawls, and various boats for special purposes, such as gunning boats, yacht boats, and the widely known sneakbox.

The canoe yawl, a boat between a canoe and a yacht, is illustrated by examples of various craft from 17 to 20ft. long, and suitable for a crew of two or three on a cruise. This class of boat, while little known among us as yet, is admirably fitted for cruising, and will meet the wants of many who object to a canoe as being too small, and yet desire a boat with the same excellent qualities. The boats and canoes illustrated are in all cases among the best of their class, the list of canoes including English, Scotch and American craft, and are all drawn

AMATEURS.

to scale, so as to be available as working drawings. The plates, for convenience in using, are placed loose in a tough manilla envelope and accompany the book.

Pp. 168, with 24 plates of working drawings. Price $1.50. Address,

GRATEFUL—COMFORTING.

EPPS'S COCOA.

BREAKFAST.

"By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast tables with a delicately flavored beverage which may save us many heavy doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame."—*Civil Service Gazette.*

Made simply with boiling water or milk. Sold only in half-pound tins by Grocers, labelled thus:

JAMES EPPS & CO., Homœopathic Chemists, London, England.

The English "Fishing Gazette."

Devoted to angling, river, lake and sea fishing, and fishculture.

Every Friday, 16 pages, folio, price 2d.

HINDS'

BLACK-FLY CREAM,

For Repelling

Flies, Mosquitoes, Midges and other Insects, and protecting the Skin from Sunburn, Irritation and Infection.

No Tar. No Stain.

GLENS FALLS, N. Y., June 15, 1884.

Mr. A. S. Hinds, Portland, Me.:

DEAR SIR—I have not sooner acknowledged the receipt of box of "Black-Fly Cream," as I desired to first test it; this I have now done on two fishing trips where I found the Mosquitoes, Black Flies, Punkies and Moose or Deer Flies in great abundance. Although all these pests swarmed about me, I found the *Cream a perfect preventive* against their bites when it was applied to face, hands, ears and neck. For many years I have sought after *the* insect repellent, and have tried all manner of compounds, but yours is the most thorough, at the same time cleanly and not disagreeable.

Yours truly, A. NELSON CHENEY.

Price, 25 Cents, Postpaid.

SOLD BY DEALERS IN SPORTING GOODS.

ANSWERS TO CORRESPONDENTS.

A TRAJECTORY TEST.

THE demand is general among riflemen for something definite on the question of trajectories, especially with reference to the rifles of to-day. There has been no end of speculation and wild empyrical writing on this matter, and the pages of every paper devoted to matters of field sport are overladen with letters and communications upon this topic. That it is an important one is evidenced by the desire shown by every rifle buyer and rifle owner to get exact data of the particular arm which he may possess and of other arms in comparison with it. Many experiments have been made from time to time by various marksmen, and the details of these tests given in the back volumes of FOREST AND STREAM; they have been very valuable contributions as far as they went; but they were not complete, especially in the matter of comparative results, and so the whole question is still an open one, ready for the careful and satisfactory answer which can only come from a thorough and well-conducted series of tests under well-defined conditions, and managed by experts about whose ability to make an exact report there can be no question.

Such a series of tests the FOREST AND STREAM proposes to make. Those who have studied the problem most carefully are the most thoroughly convinced that the time has come for such an effort. The rifle manufacturers make all manner of claims for their respective out-puts, and some of them are so strong that one is tempted to believe that the law of the attraction of gravitation is suspended, while this or that particular rifle is sending out its charges.

It is with particular reference to hunting rifles that our tests will be undertaken. In military arms the reports of the various examining boards have given a mass of statistics which fully inform us how imperfect those weapons are in the matter of flat trajectory. In hunting arms, however, where more than ever a flat line of fire is most essential in getting killing hits at the varying distances fired over, there is no such collection of figures, and it is this want our trial of arms is intended to supply.

The matter has been under consideration for some time past, and many of the arrangements have been completed. The trial will be in charge of a gentleman connected with the U. S. Proving Ground at Sandy Hook, where the various tests are so carefully made on large ordnance by the U. S. War Department. The range at Creedmoor has been pointed out as a desirable place, and except for its present inaccessibility no better place could be chosen. The tests will be made over 200 yards, and every precaution will be taken to have every possible element of error carefully eliminated or accurately noted. The present idea is to use the more popular weapons of the various makes and thoroughly test each, using the service ammunition, or rather such as is sold for general use in the various rifles. It is not to be a test of what results may be secured by special rifle, loaded with special cartridges and fired under improbable conditions, as compared with the ordinary surroundings of a man in the field after game at catch-shot distances. We hope that our results when tabulated will make a report which will be of value to every rifle owner in the world.

It is intended to have the tests follow on after the annual fall meeting at Creedmoor. In this way all interference with the preliminary practice of teams preparing for the matches of the fall meeting will be avoided, and ample time will be given for complete discussion of the tests and the offering of hints and suggestions from those having them to make. Such suggestions we cordially invite, and we will open our rifle columns for all who may have them to offer.

Before the date fixed for the trial we will give full details of the manner of making the tests, the conditions under which they will be conducted and the particular arms to be tested. All who wish may come and witness the trials. The expense connected with them will be borne entirely by the FOREST AND STREAM, and our effort will be that when made they will be under such skillful management as to compel the data reached to be accepted as standard in this department of the art of rifle shooting.

WEAK KNEES.

IT is never difficult to find persons perfectly willing to tell in a vague, general way of game and fish law violations, but when it comes to actually giving the proper official definite information for his guidance, that is found to be quite another thing. Most men who pay any attention to game and game seasons, and who see the birds killed out of season, are quite content to write a complaint about it to a local or distant paper, to set up a wail over the evils of the times, and to suggest that "something ought to be done about it." But these same men will not themselves do the first thing to help the game warden detect and punish the offenders. There is an unaccountable hesitation to assume any personal responsibility in the matter. The men who often talk the loudest about the wisdom of game laws and the enormity of the poacher's offense are the very last to give active assistance to the execution of the law. All game officials can testify to the truth of this. We are in receipt of constant complaints made by wardens and constables that they are left in the lurch by weak kneed informers, who back out before anything can be accomplished.

Every man—no matter whether he be a sportsman or not—owes it to the community of which he is a member to give prompt information of game law violations and to render the officials such aid as may be within his power. By and by this simple principle will be understood better than it is now; and then the game and fish destroyers will not have things all their own way.

SALMON AND SALMON NETS.

THE Canadian salmon season has been a very successful one for the anglers on most of the rivers. Many Americans have visited the streams this year, and the reports of their catches are in most cases favorable. The fish have been found in goodly numbers, and for the most of the time the rivers have been in fair condition.

The numbers of salmon returning to the mouths of these streams are amply sufficient to afford constant sport to the rods, if only their passage were not barred by the obstructing nets. So persistently are the streams netted that the supply of salmon in the upper parts of the stream where they are angled for is constantly diminished. The law requires the netters to raise their nets from Saturday night to Monday morning, but this provision is constantly evaded, and the result is that of the salmon caught in the upper waters of some of the streams four out of every five show the marks of the net through which they have forced their way. On a recent expedition of the officials to the netting grounds, early one Sunday morning, the nets were found in the stream contrary to law, and worst of all the Government net was there too. The destruction of these nets was followed by a marked improvement in the fly-fishing; and a similar sudden increase in the supply followed the destruction of the nets by the breaking away of a boom of logs.

The time now prescribed for the raising of the nets is too short. Another night, say Wednesday night, should be added. It is very poor economy to give so much of the salmon crop to the net fishermen. The Canadians who derive a revenue from the annual visit of the fly-fishermen, should have more consideration shown them. If the fishing is such as will attract an increased number of anglers, these people share in the proportionate gain, and the salmon revenue, though taken from the netters, is by no means lost, but is more widely distributed among the people. It is urged by those who are conversant with the condition of affairs that the Dominion Government make such changes in the present law as shall secure a more suitable division of this revenue.

FISHING ON SUNDAY.

ON the occasion of his recent visit to the Woodmont Rod and Gun Club's lodge on the Potomac River, it was reported in some of the newspapers that the President had gone fishing on the Sabbath; and straightway a great pother was made over it, which was not allayed until it was discovered that the alleged Sunday fishing had not been indulged in. The objection of those who criticised the supposed sport would have been, however, quite well taken. Whatever a private individual may determine to be proper for himself with respect to Sunday fishing, there is no question that participation in such an amusement would be improper in a high public official like the President of the United States, who is required to have a due regard for the feelings of the Sabbath-respecting portion of the public he represents.

What is true of the President is true of those in other official positions and places of influence. Even in such a matter as angling in the backwoods, a man is bound by his position and by the effect of his action, if made known, on others. If there be a law on the statute books forbidding Sunday fishing, that law should be strictly observed by such men, in no half-hearted manner, but cheerfully and to the letter, that by such respect to its provisions the claims of the statute on others may be enforced. From Canada comes a story of a Sunday fishing law violation by men in high positions, who were detected. One of them, Sir Roderick Cameron, of New York, was fined, while the other, a Supreme Court judge, escaped through a technicality. When a Supreme Court judge, because he happens to be in the woods, is willing to violate the statutes, what, pray, is he to expect of humbler folks who have no ermine to keep clean?

THE UBIQUITOUS SPARROW.—A colony of English sparrows have their abode in the music stand at Manhattan Beach, Coney Island, where their discordant clatter jars on the nerves of Gilmore's audience at the afternoon concerts. In the midst of the gloom of the New York City Hall, with its funeral draping for the Grant funeral, last Monday a nestful of young sparrows in the plaster ornament about the central chandelier in the vestibule were chirping loudly for food. The parent birds apparently feared to enter the place, though a space in the drapings had been left for them. Elsewhere we publish the English sparrow report of the American Ornithological Union. The committee's verdict is against the bird, and it is advised that measures be taken for ridding the land of the pest.

FROM THE RICHELIEU TO THE TIBER.—Mr. W. L. Alden, the newly appointed Consul General to Rome, will sail from this city in the Servia next Saturday. Mr. Alden's appointment, besides giving general satisfaction, is of special interest to canoeists, who have reason to feel grateful to that gentleman for his part in introducing and making popular the sport of canoeing in this country. Mr. Alden is the originator of a practical device for long distance cruisers, and the author of several books on canoeing. His canoe has long carried the colors of sunny Italy, and now that his paddle will be dipped into the tawny flood of Father Tiber, the good wishes of canoeists will go with him.

AN ADIRONDACK HOTEL KEEPER is reported to have said that he could with $40 buy off the game protector of his district, so that his guests could club hounded deer. This is a pretty cheap price for a game protector, and the landlord may possibly have a larger contract than he anticipated. But it shows what a law-abiding landlord he is.

THE PERILS OF ANGLING.—New angling perils are constantly developing. A Buffalo bank book-keeper was recently reported to be a fugitive defaulter, who had fled to Canada, when the fact was that he was up in Canada fishing, and as the fish were biting well had ventured to overstay his time.

The Sportsman Tourist.

FROM TOLUCA SOUTH.

(Concluded.)

AT last I parted sadly from my gentle friends of the Calvario hacienda. My way lay through the barranca of of Malianaltenango. The gulch is about five hundred feet deep and shows for that distance a fine geologic section. The name, which means "surrounded by water," is applied to a village on a point of land which juts out from the east bank, and round which flows the Salado. The great cut gouges through the plain far to the south, opening at times to show the houses and fields hidden away in the flat below, and again closing to a width of perhaps not more than three or four hundred yards on top.

Tonatico, where we stopped at night, offered nothing remarkable except a church font made out of the carved sacrificial stone of the early Indians. This was locked up and I will not answer for it.

I was told that former races lived in an old town in ruins near by, but that, disgusted by the Spanish conquest, they had buried themselves alive. As a proof of this, skeletons and coarse dishes are said to have been dug up by ploughmen. The proof may not seem cogent and the alleged antiquity of the ruins was a bubble I could prick myself, for I rode over eager to see some strange thing. Certain laborers were at work near by, and, like most of us moderns, searching always for jewels of silver and jewels of gold in these remnants of the past, they asked me with great interest, when they saw me looking over the ruins, whether I had not some skill in the discovery of treasure. I fear I dealt a cruel blow in telling them that the old walls had not been built by early natives of fabled wealth, but were of Spanish times. Very beautiful was the dismantled church and the two or three towered and buttressed fragments of masonry near by. "Amata" trees had grown over the tottering walls, spreading wide their clinging trunks like molten metal "stiffened in coils and runnels" as it flowed, but the treasure house of the races before the conquest is not here.

Further down, as we journeyed along the next day, we passed the old trenches raised by Alvarez, one of the family of hereditary governors of Guerrero (of which at least three generations have held power), when he drove back Santa Ana. The Alvarez with their "pinto" troops, have indeed, until very lately, held themselves to be independent sovereigns and permitted no meddling. Before the revolution of Mexico the State of Guerrero formed the southern part of the State of Mexico, and, after the division was made, the men of Guerrero for long kept the name of the "pintos del sur."

Every one here knows what "pintos" are, either by sight or repute, but definitions are conflicting. Some hold that certain Indian tribes are parti-colored by nature, but educated opinion inclines to the belief that "pinta" is a skin disease. Pintes, though found in other places, live mostly on the west coast, from Sinaloa to Oajaca. They are thickest in Guerrero, where the majority of the people, from the governor down, are spotted.

The discolorations appear first on the ankles, then the waist, the wrists and afterward on the face.

The blotches of varying size are sometimes violet, yellowish, or of a dark blue like a powder burn. The borders are indistinct, and though the flesh swells slightly, there are no pustules or eruption. The skin scales off after a time, in some cases to such a degree as to be a plague in itself.

The disease is inherited and somewhat contagious, and develops, at times, comparatively late. It is supposed to be caused by drinking bad water.

In Huitzuco, in Guerrero, where the scanty water is quite brackish, "pinta" is virulent. Mosquito bites are said sometimes to carry the contagion, and any bite that shows poisonous swelling should be burned with carbolic acid.

Pinta has no effect on the general health except to make the patient more susceptible to cold. It is curable at first. If left it runs a certain course. The whole body gets spotted. Then the spots turn rosy. In both these conditions the disease is communicable. After this the spots become of a milky color and so stay. The borders of these white blotches are distinct. This stage has no remedy. Few of the cases that I saw were striking. Many seemed to be only disagreeably sunburned or to be dirty. Here either the trouble was but beginning or the phase of the moon, which, curiously enough, is said to influence the malady, was not favorable. The well marked instances seemed, as the name implies, really "painted." Passing the trenches of Alvarez, I saw on an isolated hill a brown pyramidal mound which my guide told me was but natural stone. My suspicions of the guide's ignorance were confirmed on riding nearer and asking an intelligent native about the matter.

Here at last was genuine antiquity. This mound, which was called Cuautlambiejo was a "momostli" or sacred structure of the Indians. It was, as nearly as I could guess, some forty feet high and about one hundred and twenty feet across at the base. Near the top a hole made recently in search of treasure could be seen. Nothing was found except rough, solid masonry. Around were old stone foundations, buried skeletons, the coarse dishes called "apastli," the usual companions of these remains.

My informant told me that his father once in a similar mound discovered two vases full of a certain powder. Supposing the powder to be a poison or an evil charm he scattered it, but a Spaniard afterward told him it was gold dust, that it was the custom of the ancients to preserve their treasures thus, and that the finder, "like the base Indian, threw a pearl away richer than all his tribe."

Nothing else interrupted this day's travel except a moment's stoppage to look at one of the "coal" mines of obsidian that are not uncommon in ill-explored districts. Before noon we had passed an extensive limestone "pedregal" or stone heap, and were bearing down to the little village of Cacahuamilpa.

Near here is the great cave. As we approached I noticed on the hillside opposite and southwest of the town two large sinks, marking spots where the surface had fallen into the hollow mountain. A great limestone ridge here bars the egress of two rivers that flow from the north, and have burrowed tunnels through the opposing mass. Probably the cave is the ancient bed of one or both of these streams which have now cut for themselves different channels.

On the east of the ravine you go down to get to the cave, strata of schist alternate with the lime, but the pitch of these bodies shows that they have been worn away from the hill where the cave is. The ravine is cumbered with masses of dirt and trunks of dead trees swept down five years ago by a stream of water which burst out from a land-slide and then subsided. At the same time a flood near Tenango, coming after a similar land-slide, and stopping as suddenly, cost many lives. The scar of still another extensive slide, occurring at the same moment, is seen opposite Mogote, and shows that the earth action was widespread.

Getting at last to the bottom you find yourself in the gorge of a brawling river. "Zopates," a kind of rattan, grow thickly. Mingled with the limestone lie a few porphyritic boulders, whose source I could not see, and at the right, not two hundred yards away, rises a sheer wall from the caverns at whose foot dash the rivers of Cuautepec Harinas and Tenancingo.

These streams enter the other side of the mountain by different mouths quite distant from each other. They come out not more than fifty yards apart, but that they have never mingled is shown by the fact that the Tenancingo keeps its distinguishing reddish color at the mouth as well as at the entrance of its tunnel.

The cliff toward the west is some seventy feet high, rising to twice that height as it bends to the north. The top of the arched mouth of the Cuautepec is thirty-five feet or so from the water, while the arch of the Tenancingo is still higher.

It is extremely impressive to stand, with the roar of the water in your ears, looking down these great caverns, partly coated with seeping lime and rough stylactites. The jutting rocks grow dimmer in the gathering shadows of the mountain's heart, and out of the blackness, foaming among the fallen boulders, rush the headlong streams.

It is a long climb to get back from the river to the mouth of the present cave, which, by the way, has no water in it at all except one dripping pool, called "agua bendita." Outside, on the high places, are more Indian "momostlis." Within, on going down the great heap of *débris* time has piled at the entrance, skeletons were found, and with them the usual coarse dishes which perhaps had once held the food prepared for the journey to another land.

The Empress Carlota visited this cave in her short reign. Later President Lerdo, in order that republican simplicity might not be outdone by the decaying royalty of an effete world, gathered together all that was distinguished among his adherents in civil and military life, summoned several regiments of soldiers and a number of bands of music wholly disproportionate to the force, and camped in the very entrance to the cavern.

The soldiers were perhaps necessary, for the pronunciados were still rife and, if they could but have caught the entire government at once in the mountain, they needed only to get the range of the opening and bag them all; but the bands of music I fear must be admitted to have swelled the national debt for the mere purpose of personal delight.

Lerdo is also guilty, among the other vulgar, of writing his name on a conspicuous ornament, the only palliating feature being that he wrote it small. Poor Carlota is almost blameless in this matter, as her name was set down by another hand.

I have never been to the mammoth cave of Kentucky, but from the accounts I have read of it, it is clear that Cacahuamilpa is far inferior in size. Still the latter is extensive. We went in about half past five o'clock and walked slowly but steadily for nearly three hours. Probably we penetrated the mountain about two miles, and there was said to be a good distance more (perhaps a mile) that could be visited with little profit before the ground became impracticable. The roof is lofty throughout, say twenty or thirty feet, and in one place the small rockets we carried were unable to reach the top. From the time they took in their ascent, I fancy the roof there must be seventy feet or more high.

The guide divided the cave into ten "salones," for each of which he had a name. We visited eight. The stalactite formations were not very numerous, but some were beautiful. One I remember looked like a jelly fish floating in the water with all his tentacles hanging tangled down. One was a white curtain rippling and waving like an aurora borealis, and one, called the Panteon (a name corrupted to mean cemetery and then as here sepulchre) was like a great shattered column.

Near Cacahuamilpa is a village called San Gaspar. It holds about two hundred men besides women and children. It is noticeable for the fact that here the people speak the native language entirely, and hardly, if at all, understand Spanish. Nor has the ancient blood lost its old hardihood. The many crosses that testify to murderous robbery along the road, have, in great part, been raised to the memory of victims of this determined band. Last month even there was a dispute about the ownership of some land near by. So hot the matter grew that two prefects, one from Tasco and one from Tenancingo, came to interpose their authority. The bold San Gasparenians were not to be bluffed by empty titles. They held their ground until finally the difference was healed by profitable compromise. Surely we have here high qualities, both warlike and diplomatic. Signs of no mean augury for the survival of the conquered race.

Our next stop was at Ixtápan. Ixtatl, in Mexican (*i. e.* in Indian) means salt. From this comes the modern name Ixtápan de la sal. There are several towns thus called. In my Ixtápan there are many acres of salt works. Three principal springs have from 96° (36° centigrade) down to about 70° of heat.

At all these springs tanks of masonry have been built, and the water boiling up from the bottom piles itself over the surface in bubbling mounds. The working is primitive. First the water which besides 1½ per cent. of salt contains iron, magnesium, lime, soda, etc., is run over the ground at intervals for seven or eight days. Then the salty dirt is shoveled into cylinders of masonry with a little well below and water is soaked through the mass. From this strong brine a coarse salt is got by evaporating over the fire or in the sun, and brings an average price of $6 per carga (about $40 a ton).

The salt works are of great age. The little canals for flooding have been raised by constant deposits from the flowing water much above the surrounding level. Here Aztecs worked and perhaps bathed. Here their descendants follow their consecrated methods, talk the monotonous falsetto of the native tongue, and also at times bathe, undisturbed by variety of sex and unshamed by the common lack of fig leaves.

On the way to Tenancingo it began to rain. This gave me a chance to see a classic garment in use. You remember seeing pictures of Indian warriors clad in mantles of split palm leaves that look like a shredded mat? Well, these cloaks, though no longer used for continuous wear, are put on to shed the rain. I saw a good many of them, and was told that the present, at all events the local, name for them is "pachones."

Beyond here you again begin to find many magueys. There are three principal kinds: the "mano larga" (long hand), the ceniza ("ash," probably meaning ash colored) and the "tlacamelo." The first two have bluish leaves, and are used for making the inferior kind of pulque called "tlachique." The "tlacamelo" produces, either alone or mixed with the sap of the others, the "pulque fino" of Mexico.

Three broken down horses and two men sufficiently disorganized to command respect at last reached Tenancingo.

Gumecindo soon came to me with the news that two robbers, who had attacked a pack train on the road immediately after we had passed in the morning, had just been brought in by the "rurales" (the federal volunteer cavalry). Either "a martial and a swashing outside" or the evident leanness of our treasure chest had guarded us from assault.

Justice here, when it is anything but the shadow of a name, takes the form of government lynch law. The people have not the energy to right themselves. The courts are so much of a farce that, on the occasion of a recent ignoble murder, the friends of the victim were compelled to get letters from influential men to the judge in order that the assassin should be tried at all. But when crime is so common as to need strong repression, the government strikes with a heavy hand. There are three ways of going to work. Either a colonel is sent down with a detachment of soldiers, or men called "agentes de seguridad" (a committee of safety) are intrusted with power, or a single man worthy of confidence receives a more permanent appointment under the name of a "comisionado." In the hands of these officers is placed complete control. The misdoer is condemned beforehand, caught and shot and sometimes hung afterward as a terror to his fellows.

Here my trip ends. My stud is sold. We have taken places in the coach and roll bravely over the sunlit plain, while on the horizon gather rain clouds, and behind darkly looms the great volcano wrapped in his robe of storm.

My tattered but still magnificent servant leaves me, seemingly not ill-content to be rid of the imperious rule of the restless Saxon.

I part with him without regret. Others I grieve to lose.

Ah! Don Ramon! Don Cypriano! Men moulded of earth's choicest clay and tempered by heaven's directest fire, if you ever wander may you meet your likes. I can wish you no better fortune.

Everywhere I found friends. Everywhere I left friends. No one except the traveler seemed to weary of his company, and if he, as the tombstone says of the drunkard, was his own worst enemy, the kindly souls who cheered his journey and lightened his rest are not the cause of that.

God bless their hospitable hearts. H. G. Dulog.

A DAY ABOARD THE "SNEAK."

THERE were three of us, Seven-up, Sneak and the Skipper. Seven-up was a dog, alleged a setter, but certainly a dog; Sneak was a 14x4 sneakbox provided with a lug sail, a dagger board and oars; the Skipper—as Joe Emmet says—"dot vos me." The skipper had gambled for the dog and won him at a game of seven-up, hence his name. The Sneak had been cruised in, fished from and hunted out of, knocked about in lumber wagons and bumped about in freight cars for four seasons. The skipper owned his first canoe in '72, had owned half a dozen others since, and had just made the important discovery that there were better craft than canoes for single-hand cruising in open waters.

We hadn't intended that Seven-up should be a passenger, and the skipper had driven him home from the boat-house and reasoned with him about the matter with a trunk strap, but the Sneak hadn't gone a mile on her course along shore before the dog was seen loping across the fields to head off the boat at the point. Arriving there first he jumped into the water and swam for the Sneak. Such heroism and fidelity could not go unrewarded, and the skipper slipped the boat-hook in his collar, used an oar for a skid, and yanked Seven-up in out of the wet.

The breeze was light and a catboat containing a party of happy girls and boys walked past us easily. The merry crowd laughed derisively at the clumsy, plodding boat as they swept by, and as a little Skye terrier on board sent back a shrill yelp of triumph, Seven-up arose in all his majesty and hurled forth from his dripping form such a hoarse roar that the Skye sank back in affright and the skipper was forced to subdue the irate setter's wrath with the bight of the sheet. As we reached the lighthouse and rounded what a certain lady cruiser calls "the corner of the land," the breeze sensibly increased, and we made good time for ten miles, when the sun's height and the skipper's stomach both declared that dinner-time had arrived.

Now all well-regulated sneakboxes have a large-sized cuddy in the stern for carrying half a hundred decoy ducks. When you are cruising instead of ducking, that is just the place to have your alcohol or kerosene galley stove, with all cooking appurtenances, and this is the very spot where the Sneak's galley outfit was; but the skipper prefers to cook ashore when he isn't in a hurry—and he can't recollect that he has ever been in a hurry yet on a cruise—so the tiller was shifted just a half inch, the sheet was paid out, and we squared away for a shelving beach. Now the tide was strong ebb, half out. The Sneak is a heavy boat and the skipper a light man, who has had one foot in the grave for nearly thirty years (and only kept the rest of his body out by poking around in a boat at every available chance), therefore it is certain that if the receding tide leaves the Sneak high and dry while dinner is receiving attention, she will stay high and dry till the returning tide floats her off again. The skipper has been caught in this trap once, and while he was sitting on the sand for half the night among the doodlebugs and mosquitoes, waiting for high water, he invented a shore-anchoring device that has accompanied him on every tide water cruise since. As the Sneak approaches shore he prepares this device for use. The sail comes down first and then the anchor is hove from the stern in a fathom or more of water. The anchor rope runs through a galvanized block attached to the anchor and has one end permanently fastened to the stern. As the anchor falls the skipper pays out the slack rapidly, the boat has way enough to draw the line through the block till her nose is ashore, the skipper lands, passes the slack of the rope around a rock and ties the end to the boat's bow. As soon as dinner outfit is ashore the Sneak is pushed off and the skipper on shore hauls her out to her moorings, stern foremost, by pulling the rope through the anchor block, and there she rides in water enough to float her at the lowest tide, while the skipper makes fast the double line ashore. A pull on the portion of the line attached to the bow will bring the Sneak ashore, and a pull on the portion rove through the anchor block and attached to the stern will send her back again to her moorings.

Driftwood makes a poor cooking fire, as it burns quickly

to ashes instead of coals; but there is no better wood handy, so while Seven-up displays his defective early education by chasing tip ups along the shore, the skipper rolls a dampish log close to a big stone, builds a driftwood fire between them, sets the coffee-pot over where the blaze has subsided, fries some bacon, and in the boiling fat that is left crisps some slices of raw potato, cut thin as wafers. There is nothing very appetizing about this dinner, but the coffee is good, and hunger makes the diner wish he'd cut up one more potato and fried one more slice of bacon.

"Seven-up, you low-bred rascal, for decency's sake don't count every mouthful that I eat and watch my every sip of coffee as if I were some wonderful automatic sausage-machine. It's embarrassing, hang it all, to keep your eyes on a fellow when he's dining. Oh, yes, I dare say you're hungry, but if I'd owned you a week you wouldn't be sitting there staring and licking your chops. Here, there's a slice of bacon that I want myself, and there's some good brown bred cut up with it. What! won't eat it? Well perhaps I can cure you of over-daintiness by the time the cruise is over. At any rate we'll put away that bread and bacon for a future trial. You shall have some fresh water when we're aboard again."

While the skipper washed up the dishes the sun was obscured by a dark cloud, and stray puffs of wind scattered the ashes and sand in every direction. Evidently a storm was brewing, so the Sneak was hauled ashore, the traps were got aboard, we pushed off and hauled out to our moorings. After swinging the boat's bow into the wind, the centerboard was lowered, the sail hoisted, the anchor raised and the Sneak crawled away from shore on the starboard tack. When a sufficient offing was secured, we bore away with the wind on the quarter and flew up the Sound against the tide. The blow was kicking up quite a swell by this time, so the apron was set up on its stick on the forward deck, and the cockpit apron was unfolded in anticipation of a rain storm. The sky was black above, the water beneath looked like ink; even the dead-grass color of the Sneak seemed of a darker tint than usual, and only the white sail relieved the gloomy aspect. But still the rain didn't come. Past the fort we shot, then across the bay, and by the little shipyard where they make oyster sloops, faster than the brave little "box" had ever traveled before. Then a good-sized village was sighted, overtaken and passed, and as the course was laid across a bay wider and deeper than usual, where the wind got a broader sweep, the Sneak seemed almost lifted out of the water. In a canoe of her length in such a blow, even double-reefed, it would have required all the physical and mental effort of the skipper to keep her from capsizing, and the happy sailor could not help contrasting his easy posture and knowledge of perfect safety aboard his present craft with the gymnastics he had performed in a canoe under similar circumstances, when compelled to make hasty leaps to windward to keep his double-ender right side up, and dodging back and forth between deck and cockpit in response to sudden gusts and unexpected lulls.

Just here something happened.

Seven up had been uneasy for some time. He had evinced an obstinate disposition to stand up and the skipper had repeatedly ordered him to "charge," but after a moment in the reclining position he would be up on his feet again, leering at the skipper with the dull, vacant look in his grizzled eyes peculiar to the last stages of inebriation. Deeming this act on the dog's part an evidence of mutiny aboard ship, the skipper determined to make an example of him, and was reaching for a convenient rope's end when the animal suddenly assumed an extraordinary, weird and uncanine attitude. His nose was pressed to the floor boards, his tail was caressed between his legs, and his body arched up like an enraged cat's. As the skipper gazed in mute surprise, the center of the arch seemed to rise higher and higher, the nose and tail gradually came nearer together, and just as the skipper had made up his mind that the brute was going to stand on his head or execute some other gymnastic feat, there came a gurgle, a cough, a gasp—a noise as though his whole interior had broken asunder—and Seven-up was seasick! The skipper's first thought was to hurl the invalid overboard, his second was to let him alone in his misery; and the second thought prevailed. Big drops of rain were by this time falling, so the skipper drew the apron over the cockpit and a veil over the indisposed dog at the same time, donned his rubber coat and lit his pipe, and proceeded to make the best of a bad job as philosophically as possible.

The Sneak had overhauled a craft of nearly twice its size at this juncture, and the latter was made out to be the cat boat containing the merry young folks who had laughed so derisively at the plodding Barnegat ducking boat in the morning. But they were not so merry now. With two reefs tied in her sail their open boat was heeled nearly on her beam, and the boys and girls, with white faces, were clinging to the windward rail with the rain beating mercilessly down upon them. It was a puerile but perhaps a natural satisfaction to the skipper that he could glide close up and allow them to see how comfortably his derided little ship could weather the storm both of wind and rain; and when, as the Sneak left the fair weather boat behind, and the drenched Skye terrier uttered a plaintive whine, the convalescing Seven-up thrust his nose from beneath the apron and opened his huge jaws in what seemed a sarcastic grin of mammoth proportions, the revenge for the morning's insult was complete. Some time after the little craft had passed a famous summer resort on the lee shore, the skipper saw the catboat's passengers and crew land at its pier and drag their soaked coverings up to the big hotel on the bluff.

All the rest of the afternoon it rained, and it blew, and Seven-up whined, but the skipper cared not. The rubber coat felt cold on his shoulders, as though the persistent drubbing of the drops had beaten through, and the oiled-muslin apron conveyed a somewhat similar sensation to his knees. But the tobacco kept dry and the old pipe burned bravely. The skipper knew that he could trust to his fittings to keep the rain and sea out of his cockpit, but the mischief done to the interior by the seasick dog could as yet only be surmised. However, there was no use worrying about it now, for it was done, so the skipper turned his attention to picking out a suitable anchorage for the night. He wished to halt early, as there was much to do before bedtime, but no haven appeared that met all the requirements until nearly sundown, when the Sneak was run into a nook cut off from the storm by a high point, where the beach was fine gravel and sand instead of mud, where it was wild and lonely enough to guarantee a freedom from inquisitive visitors, and where there was a large cornfield close to the shore. After anchoring out the boat's tent was fished out of the locker, and much care was spent in the endeavor to get it up without giving the rain a chance to penetrate the interior, an endeavor which was only partially successful, however. Then the few remaining minutes of daylight were expended in "renovating" the scene of Seven-up's indisposition, and when all was clean and ship-shape again, the boat was pushed ashore and we climbed in the darkness and the rain up to the cornfield. It proved to be field corn but still green, and the skipper gathered a few tender ears for the evening meal, after which the shore line was secured, the Sneak pushed back to her moorings, the galley (three flamme forcé alcohol stoves) was produced, and the water put over to boil. It here occurred to the skipper that Seven-up, from the late thorough evacuation of his stomach, might be in a fit condition to receive nourishment, so the tin basin containing the bacon and brown bread before-mentioned was hauled out of the locker and offered. The dog gave one sniff at the dish and seemed to be taken with a sudden convulsive spasm. The back again arched up, the head and tail were again lowered; but as the first warning gurgle was heard, the skipper gave vent to a wild and startling yell that would have done credit to a Comanche. The gurgle never reached the gasping point, and Seven-up, frightened out of his threatened relapse, sank on the floor in a heap, panting.

The meal the skipper prepared would have sufficed for four men of his kind in the city, but the solitary voyager found it none too much to satisfy his cruising appetite, though he marvelled much that his hunger should be so intense the first day afloat. There was Julienne soup (canned, of course), green corn, boiled potatoes, brown bread, ginger snaps and hot coffee. Poor Seven-up manifested not the least interest in the dispatch of this meal, but hanging his chin (or at least what answers for a chin among dogs) on the bow deck, he sat with his head out of the tent-flap in silent meditation.

When the dishes were washed up and put away it was bedtime aboard the Sneak, but for an hour the skipper and the dog sat by the tent opening and listened to the rain and watched the lights on the vessels that occasionally passed out on the open water. As he rubbed on his hands and face a plentiful allowance of "mosquito dope," the skipper, considering the events of the day, acknowledged that it might have been a pleasanter one if the seasick dog and the continuous rain could have been eliminated; but even allowing that the scrubbing on account of the former had dampened the cabin floor pretty thoroughly, and that the latter kept the crew confined to quarters, there were redeeming circumstances in plenty. A dry rubber blanket could be spread over the floor as a foundation for the bed, and dry mattress and blankets over this; the quarters to which the crew was confined were not cramped as in a canoe, but gave room enough to move about, sit or lounge in any position; there was a sense of victory over the elements that was hugely satisfactory in this, that, let it blow as it would or rain as it may, the staunch little sneakbox with her appurtenances would be as dry and comfortable as an ocean steamer; and above and greater than all was the joy of an open-air existence, the feeling of liberty and freedom, the happy-go-lucky power to go when and where he listed and do as he pleased, that made the skipper hug himself with delight, and feel glad that he was there. And this gladness and enjoyment were present throughout the remainder of that fortnight's cruise, notwithstanding the fact that nearly every one of the following days was almost a counterpart of the one here described, that it rained almost constantly, and that fogs, mosquitoes and contrary winds did the very worst tricks they were capable of. It may be added, in justice to Seven-up, that his seasickness did not return, that he enjoyed his cruise, and learned many valuable points of canine good breeding that he has never forgotten.

SENECA.

SPORT IN THE SIERRAS—III.

ON the following Monday afternoon the water had subsided to a proper fishing stage, and was quite warm, so that reasonable hopes of a great catch were entertained by all hands. I chose to go up stream about two miles and fish down. Not daring to wade the river, from reasons before stated, fishing was hard work, as the banks were very brushy, excepting in a few spots. The trout rose freely, and an enjoyable afternoon and a creel full of fish rewarded my labors. Evening arrived before I was half way toward home, and reeling up my line I left the stream and struck across country to the road. At that place the road formed the arc of a circle, the circumference of which was the river, and in consequence I had quite a distance to travel. The chapparal soon became terribly entangling to work through, and at length almost impassable. In the angle between the river and the road rose a steep and bare granite dome, about 500 feet in height, down which had slipped many a slice of rock, loosened by the agency of frosts and storms. This loose and broken material had formed a wide talus at the base of the dome, around which I was trying to work my way. Rocks, soil, caves and pitfalls were all covered from view by the dense coat of chapparal, which was nowhere more than four feet high. If the reader has ever attempted to force his way up a mountain side through a similar growth, he will realize what a very large-sized contract I had on hand. The brush all pointed down hill, owing to winter snows weighing it down and sliding over it, and to force one's way upward is like pushing against a *chevaux-de-frise*.

Darkness was setting in and I struggled on, knowing that it could be but a few hundred yards to the road. The rough and sharp-edged rocks gave an uncertain foothold at the best, and weighed down with the creel full of trout, and handicapped with the rod, which had to be saved from injury at all hazards, I received a number of very severe falls by being tripped in springing from rock to rock. Not being very strong yet, I was fast getting wearied out when, to make matters more interesting, just as I had taken another tumble and lay staring rather dazedly at the darkening sky, *skir-r-r-r-r-r!* went a rattlesnake at my very elbow. To my frightened ear the rattle rose to a perfect whirlwind of sound, which was under, over and all around me. I lay without motion, as though already paralyzed with the poisonous fangs, and the infernal din gradually ceased. A branch settled and cracked under my weight, and the noise again aroused his ire. By this time I could no more have remained quiet than if a red hot poker had been applied to my spinal column, and making a desperate effort, fairly rolled and tumbled away from the danger. After gaining a safe distance I could still hear him singing away, but as I had never lost a rattlesnake in all my life I had no desire to find any, and left him to sing himself to sleep if he so desired. I shall never know why he did not strike me, because I am certain that he was lying directly beneath me. I have always thought that the mat of bushes upon which I fell prevented him from striking, and thus saved me from a dangerously painful, if not fatal experience. Either the chapparal was not so thick after that, or there was more mettle in my heels, for I was not long in gaining the road and the house.

On the ensuing morning, Will, the Terror, and myself planned a visit to the little lake forming a source of the river, and distant about nine miles. So Will harnessed his horses to the buckboard and we started. We had to ascend nearly 3,000 feet, the heaviest grade lying in the first five miles. When nearly at the summit, and within a mile of the lake, we left the road and drove over fallen timber, through underbrush, large trees and deep mud holes, down into a beautiful little meadow, at the head of which we stopped. The horses were unharnessed and one was turned loose to graze, while the other was tied to a tree in the shade, the supposition being that the free one would not leave his companion. How this resulted the sequel will show. A tramp of another half mile brought us to the lake, a small body of water—nothing more than a respectably sized pond, in fact—surrounded by a fringe of timber, backed by the eternal peaks. We found the only boat in possession of a professional fisherman, who made his home on a larger lake, some three or four miles distant, and who had come here a few days previously for the purpose of skinning this one. He proved a good fellow in his way, however, and readily came ashore when hailed, and gave the Terror and myself seats in the boat. Will skirmished around and found an old raft on which he trusted himself on the "wild rolling tide." The professional, whose name was L., would not fish anywhere only in the deepest water, and with an anchored boat. Of course, under those circumstances, my flies were of no use, and I sat and bobbed with bait in some fifteen feet of water, a very disgusted individual. However, after 3 o'clock P. M., we did better, as L. left to carry his trout over to meet the stage in order to forward them to market. After getting control of the boat we took Will in and had some excellent sport, getting sixteen trout that averaged almost a pound each.

At 5 P. M. it was time to leave, so packing up our rods, etc., we started. A few moments' walk brought us to the place where our horses had been. A broken halter, still attached to the tree, told us all too well the disgusting tale, that a nine-mile tramp separated us from home and supper. I proposed that we skirmish around and try to find the horses, but Will assured us it was of no use, as he knew that on getting free they would surely strike out for home at once, and that they were probably there at that very moment. Supposing that he ought to know best I acquiesced, and then we held a council of war as to the next best thing to be done. Will proposed that we place the harnesses and our own duffle upon the buckboard, secure it from falling off, and then pull the vehicle by hand back to the road. "Then," said he, "we can go home down the grade as easily with the buckboard as without it, and as soon as the horses get home Henry will start up the road with them and meet us." This sounded well, so to it we buckled. Will took the pole, the "Terror" and I each caught a whiffletree, and away we went. We accomplished the first hundreds yards very well, after which came some soft ground, and then a steep ascent through brush and timber to the road. My profession as a medical man renders it necessary to spend a goodly portion of my time behind a horse, but in all my life up to that hour I had never before experienced so lively a feeling of commiseration for that noble and much abused animal. Reader, there is no doubt about it, you have got to have the toothache yourself before you know how it hurts. We spit on our hands, tugged, grunted and sweated until at last, three weary mortals, we had the infernal vehicle upon the road. Then it was that the labor of holding back came in, and which was the worst upon our tired muscles was hard to decide. At last, after descending a bit of very steep grade, I "bucked" on the proposition of any longer making a horse of myself, so shouldering our rods and fish we left everything else by the side of the road and struck out for home, which we reached at 9:30 P. M., tired and hungry. There we found some new guests, among whom was Will's brother. The whole household was in a state of anxiety about us, as the horses had not returned home. They were no doubt quietly grazing in our immediate vicinity at the very moment we were discussing their probable course. And, in fact, they did not arrive until after daylight the next morning. This little adventure has taught me not to be too ready to accept another's opinion where the chances are that he may be mistaken.

On the following day the different guests went off their separate ways in quest of sport, and I was left to go down the river alone. The trout rose very freely to the fly, and had I been able to wade the stream would have soon loaded myself down with more than I could carry. As it was, I filled my creel in about two hours' fishing, besides stringing a few larger trout on a willow fork. In fact the temptation to make a "trout hog" of myself was very great. It required a deal more effort to stop, with the trout rising at every cast, than any one never subjected to the trial can easily realize. I did it, however, and can now look back with pride to the fact.

Hitherto I had no companion in my sport upon the stream, as the Terror proved to have little of the angler in him, and preferred dancing attendance upon the pretty O. to any sport requiring much effort. But to-morrow B. will arrive, with his wife and little daughter, and then I will have congenial companionship. B. is not a skilled angler, but dearly loves the sport, and is a king of good fellows.

The next day is given to deer hunting by Will, his brother and myself, but without result. B. arrived late that night, and on the following morning was too tired to leave the house, so Will and I start out for the lake again to have a combined hunt and fish. Taking my own team this time, on our arrival I secure the horse so that no funny business shall occur, and shouldering our rifles we start out for a hunt. Taking the dog, Will follows around the base of a large mountain to the right, my course being straight up. After half an hour's climbing I came out upon a spot where the mountain side is hollowed away into a huge basin, the bottom of which lies 1,000 feet below. Here, where I can have such an extended view, I take my stand. What a glorious sight! With my back toward the Sierras' crest, I look out over the central valleys of the State. On this spot the air is as pure and clear as ether, but down there all things are covered with a quivering yellow haze, that tells of the intense heat which is scorching the poor harvesters in the broad wheat fields below. At my feet lies this great basin, filled with a gigantic forest growth, hemmed in on three sides by granite walls, with immense banks of glittering snow lying in their angles.

But hark! far below sounds the voice of Turk, mellowed by the distance into sweetest strains. In a few moments it swells out louder and clearer, and my pulse quickens for the deer must be coming this way. Yes, there he comes!

fully half a mile away, bounding up the mountain straight as an arrow for the very spot I stand on. A noble fellow; on he comes until within range, when he disappears behind a patch of mountain birch and fails to emerge. He must have caught a glimpse of me, I fear. Gazing intently, after a time, I discern his head through a screen of leaves. It is turned back over his shoulders, with ears set to catch the voice of the hound. I quietly wait for him to jump out into the open ground, which he soon does and a bullet rolls him over. The thrill of delight which follows a successful shot was mine at last, and I advance to cut his throat. I have to force my way through a patch of brush, and on emerging imagine my chagrin when there is no deer in sight. A hasty glance reveals him making good time up the mountain side, 200 yards away. Another shot fails to stop him, and he disappears among the timber. Of course I load him with abuse for being so infernal mean as to try and preserve his own life and deprive me of venison. He fell like a log and lay without motion until I entered the bushes. How did he get away? There is considerable blood upon the ground, showing that he was badly wounded as well as stunned. I must have creased him across the neck, for as all hunters of any experience know, a creased buck will fall as one dead, but after a few seconds they will get up and bound away as if untouched. Turk soon followed along, and on getting scent of the blood uttered howls of delight and disappeared on the track. I follow on until all traces of blood cease, and the hoof prints can no longer be discerned on the bare granite, and have to desist. The dog also goes out of hearing, and I have to abandon all hopes of my game. After a time the dog comes back dripping wet, showing that he has lost the track in some of the numerous little glacier lakes which stud these summits. I return disappointed to the carriage, where Will soon joins me. Partaking of luncheon, we repair to the lake. A thunderstorm is coming, and its mutterings fill the air. It is turning chilly now that the sun is obscured, and chances of sport are doubtful. There are no fish to be had, and after getting thoroughly wetted and then chilled with a pelting hailstorm, we give it up with just one half-pound trout, which Will succeeded in catching. On getting back to the team the sun had come out again bright and warm, and noticing some caddis worms in the stream issuing from the lake, we roll up our sleeves and gather a supply for future use. Having filled our bait cans with fine fat fellows we return home. AREFAR.

California.

KUDJEE-ME-KUDJEE.

At Caledonia, Queens county, Nova Scotia, I heard of some great catches of trout at the "Eel Wier," and a party of four—Mr. P., Dr. C., Mr. B. and the writer—decided to try their luck, and test the truth of the various fish stories in circulation. Starting one beautiful morning from Caledonia we drove to Kempt, six miles, and there secured the services of David Truman, the celebrated guide. After a short drive we arrived at Grafton Lake, and having loaded up the boat, partook of our noonday meal, with spruce logs for table, the bark for table-cloth and black flies for sauce. Many and lusty were the calls for "the tar," but having once thoroughly painted up, we could laugh at the insinuations of the vicious little brutes. A row of a mile and a half across Lake Grafton brought us to "The Run," where for a mile the waters rush with great rapidity and ever increasing hubbub and roar to Lake Kudjee-Me-Kudjee. Pausing a few moments to thoroughly stow cargo, Dave takes the bow and Doc, who is also a thorough woodsman and perfectly at home at this kind of work, the stern, while the rest of us squat in the bottom of the boat and prepare to enjoy the scenery.

"All right," sung out by Dave and answered in the affirmative by Doc, we shove out from shore and enter the rapids. To one unaccustomed to this sort of work it would seem sheer madness to enter such a place, but with Dave it is mere child's play. Taking the wildest waters always, with now a shove on this side to clear a huge boulder, and now one on that to escape a half-submerged log, down we rush. Past huge rocks and under overhanging trees, we round a turn in the stream and float out into a beautiful pool. Dave gives his hat a shove further on to the back of his head, wipes the perspiration from his face, and, having received a "Well done, Dave," from Mr. P., and "All right" from Doc, shoves the boat to the outlet of the pool and we again enter the boiling, rushing torrent. On, on, we go. Missing rocks that would be our destruction should we strike them by barely an inch, but guided ever by the strong arms and practiced eyes of our guide and the Doctor, we at last glide out on the broad bosom of beautiful Lake Kudjee-Me-Kudjee, a lake seven miles long by two broad, and dotted with over three hundred islands.

Now comes the serious part of the trip, as we have before us a six-mile pull down the lake, and the wind is dead ahead. As all things have an end, however, so did this hard pull, and at last we arrive at the outlet of the lake, called by the Indians the Eel Wier, our objective point.

The sun is but half an hour high, and Dave insists we have no time to fish, as camp must be made before dark; but who cares about camp with trout jumping by dozens on all sides of us? so we out rods and at them, while Dave gives us to understand we have but an hour at the most to fish, as that camp must positively be made before dark. Mr. P. gets to work first, and at the first cast hooks a beauty, then comes Doc with a double, while the writer, neglecting the old adage "to make haste slowly," tangles up his casting line and gets in at the funeral five minutes late. For ten minutes there is lively work, Dave using the landing net as fast as he can ply it in a one, two, three manner, often all three of us having a trout on at the same time, and at the end of that ten minutes fully a dozen fine trout lay gasping in the bottom of the boat. Certainly one cannot be blamed for some little excitement on such an occasion, and Doc seeing three trout rise at once, one to each of his flies, strikes too hard, and although two of them are hooked, his rod is hopelessly smashed, the second joint going into three pieces. He winds up his line a sadder man, and as miserable a member of the profession as Nova Scotia can for the time being produce. We two fortunate ones keep at it, and at the end of Dave's hour go ashore and count up an even seventy-five trout, of an average of one pound each.

"Bustle around lively, boys, and get up the shelter tent, and bring in wood for the camp-fire" is the word, as it is nearly dark, while Dave, judging our appetites by his own, selects ten of the largest trout and proceeds to cook them as only Dave can.

Supper by camp-fire. How many of your readers know what solid enjoyment those four words convey, and what a good-will feeling comes over one as, having swallowed the last of your second pound-and-a-half trout, and drained your second or third cup of coffee, you lie back on your blankets, light your pipe, stretch out your feet to the fire, and forgive your worst enemy *pro tem.* With stories from Dave of his many adventures in this very neighborhood with the moose and the bear, the evening is passed, broken once for a few moments, as if to verify Dave's stories, by a terrible crashing of the underbrush made by a moose, which, coming to the river to drink, sees the light from our fire, and starts off on a bee line for the next county. Gradually we drop off to sleep, all but poor Doc, who burns the midnight campfire in vain efforts to splice his rod. Vain, indeed, he finds his labor, and seeks his blankets in disgust.

Up again at five in the morning, in answer to our guide's call of "hot trout," we take a hasty dip in the clear, cold river, and swallow our breakfast as only impatient fishermen can, for the trout are jumping by hundreds before our very eyes, and we can hardly wait to refresh the inner man, so eager are we to be out and at them. Doc prefers to remain in camp, as his tackle cannot be made to work. So leaving him with the remains of the breakfast, we push out from shore, and in less time than it takes to write it we are both hooked to fine fish, Dave drops the anchor, grabs the net and prepares for business. The exact details of that morning's fishing are indeed foggy to my mind, and swallowed up in the general result, but enough I can remember to know that scarcely could a fly touch the water without raising a fish, and several times we were both rewarded with doubles. At last the long looked-for moment came to me. Three beautiful trout rise at the same time, one to each fly, and each one secures the object sought for and hooks himself hard and fast. Reader, have you ever hooked three large trout at the same time in water running like a mill race? You know the thrill which comes over you, the ecstasy with which you watch every leap and wild rush, mixed with many pangs of regret that you had not changed your well-worn casting line five minutes ago, as Dave suggested. This time, however, the line proves true to its owner, and after many wild plunges and two magnificent leaps by the largest trout, and probably ten minutes' careful but exciting work, they are reeled up to the boat, and fortunately having two nets, the two lower fish are carefully netted, and the third lifted over the side. The largest fish of the day is one of them, and the three together weigh 44 pounds. A wild hurrah from the bank greets our ears as the fish are safely landed, and turning in that direction we are just in time to see the Doctor, who has taken up his stand on a large boulder to watch operations, wildly clutching the air for something to hang on by, and not finding the aforesaid something, with a terrible splash go head over heels waist deep into the river.

Half an hour more of the sport, and Dave announces that it is 9 o'clock and time to make a start for home, so after catching our "one more trout" several times, we reluctantly reel up our lines and go ashore to pack up, as two of us must be back at Caledonia that same evening. Reluctantly indeed we reel up, for hundreds of trout are still there to be caught and could be caught before night could we stay, but we have enough at any rate, and Dave soon announces 136 trout as the morning's catch, and 211 counting those of the evening before. Selecting two and a half dozen of the finest fish to present to a friend, the remainder are carefully cleaned, the tent struck, hampers packed, and the homeward march begun. Although none of them were large, the average was considerably over a pound each, as counting out forty-five fish which were eaten in camp, and given away without being dressed, the remainder, which were dressed (and after being cleaned), tipped the scales at 153 pounds. Not bad fishing for five hours with two rods. Kudjee-Me-Kudjee, one of the finest of the Nova Scotia fishing resorts, should be made known to your American readers, for although in Nova Scotia, it is much easier to reach than many of the Maine resorts, and nothing in Maine can rival it in the numbers of trout. Leaving Boston in the morning by International S. S. Co. you reach Annapolis the following afternoon at 3 o'clock, fare $5. Then by Caledonia coach to Kempt, thirty-nine miles, reaching there the same evening at 8:30, fare $2.50. At Kempt sportsmen can put up at David Freeman's till ready to go into the woods. Freeman is a thorough and genial guide and perfectly equipped with canoes and camping outfit, and any one securing his services can rest assured of having a good time and returning with something better than the well-known "fisherman's luck."

A party from Caledonia who visited this place a few days before we did, returned with over 400 trout, the result of nine or ten hours' fishing. W.

"That reminds me."

159.

Several years ago it was my large privilege to be pastor of a certain church on the shore of New Hampshire's most famous lake. One morning I drove to the residence of Sidney G., a member of my choir, for a few hours' trout fishing on one of my favorite streams. After reaching the meadow I cautiously approached a deep pool, well screened by high banks and bushes, where I had often caught the king trout of the trip. Dropping in there quickly came a tremendous tug. Standing where I could see into the pool, I knew that the trout had not touched the hook at all, but was venting his strength on the sinker. Sidney, however, who stood somewhat in my rear, was in ignorance of the true condition of affairs, and forgetting in his excitement over my non-action that I was his pastor, he fairly yelled, "Pull, you devil! Pull, you devil, pull!" I lost the fish, but the bursts of laughter which followed were equal to a week's vacation. J. Frank Locke.

Some thirty years ago a couple of hunters in St. Lawrence county were spending the fall hunting in the South Woods, as was their custom, when one night one of them, P., got in so late to the shanty that he did not draw the charge from his rifle as usual. During the night a large owl awoke them by his hallooing *Whoo! Whoo! Whoo!* and his music kept them awake, until P. got up in his anger, seized his rifle and stepped out of the shanty, saying, "Cuss you, I'll let you know who," and drew up and fired at the sound, in the top of a large hemlock standing near the shanty. In a jiffy he heard a rustling in the bushes, and a thud on the ground. The next morning he went to the tree, and there lay a big owl, shot right through by a chance shot. Bullpout.

THE ENGLISH SPARROW.

VERDICT OF THE AMERICAN ORNITHOLOGISTS' UNION.

At the meeting of the Council of the American Ornithologists' Union, held in Washington, April 21, 1885, the committee appointed in September, 1883, to inquire into the question of the eligibility or ineligibility of the European house sparrow in America, rendered its final report, which was accepted and adopted as the sense of the Union on the subject, and the committee was discharged with the unanimous thanks of the Union. The report, which was accompanied by a large quantity of valuable data, is here given:

Mr. President and Members of the Union:

Your committee appointed to inquire into the eligibility of the European house sparrow (*Passer domesticus*) as a naturalized resident in this country, has the honor herewith to submit its report. After due consideration, your committee adopted the following form of circular letter, which was framed to elicit information from all quarters and from all interested persons:

The American Ornithologists' Union, an organization resembling the British association of similar name, and including in its active membership the most prominent ornithologists of the United States and Canada, purposes, among other objects already engaging its attention, to determine as nearly as possible the true status in America of the European house sparrow (*Passer domesticus*), commonly known as the English sparrow, in so far as the relations of this bird to mankind are concerned. The Union hopes to secure through the solicited testimony or others, as well as the personal observations of its members, the facts necessary to settle the question of the eligibility or ineligibility of this sparrow as a naturalized resident of this country. The question of the European house sparrow in America is regarded as one of great economic consequence, to be determined primarily by ascertaining whether this bird be, upon the whole, directly or indirectly, injurious or beneficial to agriculture and horticulture. Its economic relations depend directly and mainly upon the nature of its food; indirectly upon the effect, if any, which its presence may have on useful native birds and beneficial insects. The accompanying formula of questions is respectfully submitted to the attention of those who may be able and willing to record statements of positive facts and value derived from their own experience. Concise and unquestionable answers returned to the undersigned on enclosed blank, or otherwise, or communicated to any member of the committee, will be appreciated and prove of high value among the data upon which it is hoped that this vexed question may be set at rest. The evidence thus obtained will be carefully considered by the committee in preparing its report to the Council of the Union, and a digest of the same, with recommendations, if any, will be submitted by the Council to the mature judgment of the Union at its next annual meeting. The following named active members of the Union were, at the first congress, appointed a committee to investigate and report upon this subject: Dr. J. B. Holder, of New York, chairman; Mr. Eugene P. Bicknell, of New York; Mr. H. A. Purdie, of Boston, Mass.; Mr. Nathan Clifford Brown, of Portland, Me.; Mr. Montague Chamberlain, of St. John, New Brunswick; the committee having the power of increasing its membership at its discretion.

Dr. J. B. Holder, Chairman.

American Museum of Natural History, Central Park, New York city, Feb. 2, 1884.

DATA CONCERNING THE EUROPEAN HOUSE SPARROW FROM.....

1. Is the European house sparrow (*Passer domesticus*) known in your neighborhood, and if so, about when did it appear? 2. Is your neighborhood city, suburbs or country? 3. Is this sparrow abundant? 4. Is it increasing in numbers? 5. How many broods and young, yearly, to a pair? 6. Is this sparrow protected by law? 7. Is it artificially fed and housed? 8. Does it molest, drive away or diminish the numbers of native birds? 9. If so, what species? 10. Does this sparrow injure shade, fruit or ornamental trees? 11. Does it attack or injure garden fruits and vegetables? 12. Does it injure grain crops? 13. Is it an insect eater or a seed eater? 14. What insects, if any, are chiefly eaten by this sparrow? 15. What is the principal food it carries to its young? 16. What insects, if any, are carried by it to its young? 17. Does the food of the old bird vary with the seasons, and if so, in what way? 18. Does the food of its young vary, and if so, how? 19. If any insects are eaten, are they beneficial or injurious species? 20. Does the sparrow eat the larvæ of the vaporer moth (*Orgyia leucostigma*)? 21. Does it eat ichneumon flies? 22. Do you determine the nature of this bird's food and that furnished by it to its young by inference, direct observation or dissection? 23. Have any injurious insects been exterminated or materially lessened in numbers by this sparrow? 24. Have any injurious insects increased in numbers, or appeared where unknown before, in consequence of the destruction of other insects by this sparrow? 25. Have these sparrows in your neighborhood been destroyed systematically or otherwise, and if so, by what means? 26. What bounty, if any, has been offered for their destruction? 27. What is the general sentiment or balance of public opinion respecting the European house sparrow in your locality? 28. On the whole, in your judgment, is this sparrow an eligible or ineligible species in this country?

In order to secure a thorough presentation of the subject to those most likely to respond satisfactorily, each member of the committee assumed the duties of correspondence in his own section of the country, as well as in certain allotted sections of the entire United States and Canada. Copies of the letter were sent to the agricultural papers, to the various journals having columns devoted to zoological and rural matters, and to the press at large. The greater part, however, was directed to individuals believed to possess facts pertinent to the subject. About one thousand copies were thus sent out.

A large proportion of the answers received are of one import, written by persons having no definite data to communicate, but who, having experienced annoyance from the bird's uncleanliness and unmusical notes, desire to see it exterminated. Under this head belong the numerous petitions which have reached us from several quarters, notably from Philadelphia. The subject is regarded sufficiently important by the inhabitants of that city to warrant the issue of printed forms, which, with long lists of subscribers, have been submitted to the consideration of your committee. The paucity of replies to many of our questions renders it impossible to report upon them decisively. Others, however, are fortunately very fully answered.

Returns to the first question give some data of interest in relation to the time of the sparrow's first introduction into this country. The earliest date of importation known to us is 1858, when Mr. Thomas A. Deblois liberated a few individuals at Portland, Me. These disappeared shortly afterward, and were not successfully replaced until 1875. In 1858 sparrows were liberated at Peacedale, R. I., by Mr. Joseph Peace Hazard. They were first introduced into Central Park, New York city, according to Mr. Conklin, the superintendent of the menagerie, in the year 1864. In 1860 Mr. Eugene Shiefflin turned loose twelve birds in Madison Square, New York city. In 1868 the species was first introduced into Boston Common. In 1869 a number were given the liberty of the parks of Philadelphia. Somewhat later a successful attempt was made to establish a colony near Great Salt Lake, Utah, and about the same time the birds became resident at Indianapolis, Ind.

In a period of about ten years the sparrows reached nearly all the large towns and cities of New England and the Middle States, and many of those of the Western States, without artificial assistance. It also made its appearance in suburban towns and even country villages. From the Southern States

and the Western States beyond the Mississippi River we have received but few returns, and most of these state that the sparrow has not been observed. In Canada it has become generally distributed over the southern sections of Quebec and Ontario (it is abundant in the city of Quebec), and in 1884 several flocks invaded New Brunswick.

Few observers have definitely determined the number of broods hatched yearly by this bird, and the number of young to the brood. We have, however, returns from several ornithologists. The maximum given by Mr. H. B. Bailey, of Orange, New Jersey—six broods in one season, with from four to five young in a brood—probably indicates the extent of the bird's fertility in this climate. The usual number of broods in the latitude of New York and southward appears to be four. In more northern districts, three broods yearly would probably be near the average.

There is an overwhelming mass of testimony to the effect that the sparrow molests and drives away certain of our most valued species of native birds. Many statements have been received giving accounts of conflicts provoked by the sparrow in which it was cruelly victorious. It is affirmed that from some localities native species have been completely banished by the attacks or by the mere presence of the foreigner. We have also evidence of an opposite character, declaring the sparrow's peaceable disposition and its association upon amicable terms with other species of birds.

Most of our correspondents state that they have never known the sparrow to commit depredations upon crops, but well authenticated instances are furnished showing its ability and disposition to accomplish great destruction to grain. Mr. Stewart, of Hackensack, New Jersey, relates the destruction of a wide margin of wheat in the field. Hon. G. A. Bicknell, of New Albany, Indiana, says, "When the grain ripens the sparrows leave the city and attack the wheat fields in the suburbs. I have seen hundreds of them at once in my fields and they got about half the crop." Mr. T. G. Gentry, in his exhaustive work on the sparrow, gives similar instances. That the bird feeds upon fruits is amply attested.

Our thirteenth question calls for information as to the sparrow's preference for food. Is it an insect eater or a seed eater? Every reply to this question, which is based upon dissection, agrees in attributing to the bird a diet almost wholly vegetable. The statement of some observers, that it devours canker worms and a variety of insects, is unaccompanied by reports of examinations of the stomach.

The question as to the food of nestling sparrows elicited pretty uniform testimony, animal matter in some form being said to constitute the bulk. Dissections by a competent person, however, show "barely a trace of insect or animal food, but in lieu, fine gravel and vegetable fibre."

Responses to questions seventeen to twenty-one inclusive, are too meagre to be of value.

It is claimed by several of our correspondents that the measuring worm, so abundant at the time of the sparrow's introduction into this country, was well nigh exterminated by the bird, so that for a considerable period it was unobserved. Since it is a well-known fact that the worm occurs in very variable numbers in different seasons, credit for its comparative extermination in this case can hardly be given to the sparrow upon the doubtful evidence before us.

The experiment has recently been tried in Philadelphia and elsewhere of substituting sparrows for pigeons in trap-shooting, but, of course, without seriously diminishing their numbers. In other localities the birds have been poisoned or otherwise gotten rid of to some extent by indignant citizens in defiance of laws.

The balance of public opinion is strongly adverse to the sparrows. Our returns, however, show protective laws (usually the same statute which provides for the security of other small birds) in Maine, New Hampshire, Vermont, Rhode Island, New York, New Jersey, Ohio, Michigan, the District of Columbia and Canada. The Massachusetts law has lately been repealed, and specially exempts the English sparrow from protection.

So much for the evidence. We have learned the capacity and disposition of this bird to injure grain and fruits, and that when gathered in large numbers it threatens very seriously the interests of the farmer and horticulturist. Although testimony of a certain kind indicates that its young are fed with insects, actual dissection shows that vegetable substances are mainly employed. The adult birds feed almost exclusively upon seeds and grains. They drive away from their accustomed haunts, either directly or indirectly, many of our native insectivorous species. It may be added that they have proved in recent years so destructive of crops in other countries, as to render it necessary to enact laws looking to their extermination. In view of these facts, your committee believes that the European sparrow (*Passer domesticus*) is an ineligible species in this country, and that it was a mistaken policy to introduce the bird. And we would respectfully recommend:

(1) That sheltering or otherwise fostering the sparrow by the public be discouraged, and that its introduction artificially into new localities and its sale for such purposes be forbidden by law.

(2) That all existing laws protecting the sparrow be repealed, and that bounties be offered for its destruction.

(Signed) J. B. HOLDER, Chairman,
EUGENE P. BICKNELL,
H. A. PURDIE,
NATHAN CLIFFORD BROWN,
MONTAGUE CHAMBERLAIN.

[The Michigan law protecting these birds has been repealed.—ED. F. & S.]

GROUSE AND YOUNG AGAIN.

Editor Forest and Stream:

In my article of July 16, under the caption of "The Cock Grouse and Young," I stated plainly that it was a male bird which returned after the female had given up the attempt to draw me away from the vicinity of her young. In an editorial note at the end of the article you ask, "How did our correspondent know the bird to be a male?" My answer is, that I knew it to be the male by the same means that I should distinguish the turkey cock from the hen—by the general appearance. While admitting that the difference between the cock grouse and the hen is not so marked as in the case of the barnyard fowls, yet to the close observer, familiar with the partridge from boyhood, there is little chance for mistaking the sexes, especially during the incubating and brooding seasons. At this time the plumage, as well as the behavior, of the hen grouse is greatly changed. Her feathers fade and her body becomes thin. In short, to use a familiar expression among country people, she looks like "a sitting hen."

"Jay Bebe," in taking sides with the editor, in his article in the FOREST AND STREAM of July 30, mentions this "peculiar condition" of the hen bird at the incubating season. But although he has once in his life been so fortunate as to have poked the hen partridge with his cane at this peculiar season, yet he does not pay my capabilities of observation much of a compliment when he decides that the magnificent plumaged cock, which returned after the rusty, "old sitting hen" had left the vicinity of her young, in the case in question, "was in reality the hen which he had seen."

But, dear friend "Jay Beebe," the sitting partridge was one of the first terrible experiences of my childhood, when she actually drove my brother and me in terror from the thicket. But alas! we grow older in a neighborhood in Maine where partridges were so plenty as to be almost a staple article of food—certainly a luxury which could be obtained at almost any season of the year. The little fowling piece, costing the whole of $3.50, slew the male grouse at all seasons, the hen never, from the opening of spring till the chicks were old enough to become a part of the game bag.

Has "Jay Bebe" ever plunged headlong into the brushwood the moment he heard he peculiar cry of the hen grouse, and secured two of the little fledglings, one in each hand, before they had time to hide? Does he know that the hen partridge never utters that peculiar cry till the young are hatched? Has he ever had two or three cock partridges at a time marked down by their drumming, the logs located and the nest ambush-mapped out to approach each bird within gunshot of the little fowling piece—not more than four rods—but waited till the office of the male bird was not further needed that season, but the bird himself was needed for the table? Has he ever crawled, before daylight in the morning, into a hollow stump within ten feet of a drumming log and watched the drumming and courtship of the male grouse. If he has had these experiences, and yet will write to the FOREST AND STREAM that he believes it to be possible for any man of like experience, owning a pair of fairly good eyes, to mistake the cock partridge for the hen, why, then I shall feel obliged to confess that—that—that his powers of discernment are not so good as his article indicates.

The cock of the ruffed grouse, although Murphy and other writers have not mentioned it, is a larger bird than the hen. The plumage is darker, especially the tail, which is longer; the ruff is darker, more glossy, and far more prominent. In some parts of New England the hen grouse scarcely has the ruff at all. Indeed, from a bevy of young birds, admitting that they be full grown, it would be easy to pick out the males by the marks I have mentioned. But I am very much obliged to the editor of FOREST AND STREAM and "Jay Bebe" for suggesting that I may have been mistaken in the case of the birds near Richardson Lake; for it has brought to memory a number of interesting partridge experiences long forgotten, but which I may now wind occasionally into FOREST AND STREAM with the good editor's permission.

SPECIAL.

QUAIL IN CONFINEMENT.

Editor Forest and Stream:

In mowing a field of grass last year the machine exposed two quail nests, one with eighteen and one with twenty eggs. The quail did not return to the nests, and I took the nest with twenty eggs and placed them under an old hen. She proved to be a bad mother, deliberately killing the quail as fast as hatched. This year I located the nests in the fields before mowing, and so saved them, but I unexpectedly found one on the lawn near the house in cutting the grass in June. I put these eggs under a small young hen, and after sitting full three weeks she hatched fourteen out of fifteen eggs. The quail all came out of the shell in one day, but kept under the hen until the next morning. I took the hen off the nest and cleaned away all the shells. The quail scattered in all directions, except two that were too weak to run. These two died the next day; and on opening their crops I found they had eaten nothing. The remaining ones kept up a plaintive peep, but the hen could not induce them to eat, although I had put near them ants, ants' eggs, cornmeal and sugar to attract insects for food. They preferred to creep under the hen to keep warm or to hide.

The second morning the hen came off the nest and began to pick up the ants and other food and call the quail's attention to it, and she soon taught them it was good to eat. After eating for a time they crept under the hen again, and for most of the first four days spent their time there.

On the fifth day it was suggested that we give them, with the cornmeal, the yolk of a hard-boiled egg. I gave it to them twice. They ate very heartily of it, and three died. On opening their crops we found each one very much distended and the food undigested. When two weeks old they began to scratch for food, and did not like to eat the corn meal. I am now feeding on cracked buckwheat and grasshoppers. We catch the grasshoppers by spreading a sheet on the grass and driving the hoppers on to it, then gather up the cloth and shake it in the quail house. The birds will eat from 100 to 200 grasshoppers a day; in fact they have never cried quit.

The quail house is about 7 by 7 feet, and 8 feet high, with openings under the roof for ventilation. The yard is 7 by 35 feet (double this size would be better), inclosed on all sides with wire cloth. The top is boarded over about one-third of the distance to make a shade and protection when they are out of the house. The wire screen or cloth surrounding the inclosure should be large enough to let in flies and grasshoppers, but not so large as to allow a quail to get its head through. The floor of the house is of earth and the yard is in grass.

The quail are now seventeen days old, strong and well, and as tame as chickens of the same age. The two quail to which the nest belonged became quite tame and could be seen at almost all hours near the house, and when the young quail hatched they would walk around the yard or sit on top of the inclosure where the young quail were confined. The female laid one egg on the top of a haycock, one near the quail yard and another one on the road near the house. I think she is now nesting again regularly. Another quail hatched fifteen or sixteen eggs under a bunch of hay within three feet of a path where children were passing at all times of day. W.

LONG ISLAND, August 1.

Editor Forest and Stream:

In the fall of 1883 I bought 75 live quail, intending to care for them until spring and then put them out for the purpose of affording increased sport in the following fall. Mr. Frank Crompton having taken a notion to the birds agreed to care for them, and before putting them out in the spring expressed a desire to try the experiment of breeding them in captivity. We selected two pair, built in a secluded part of his yard a large wire cage inclosing a few bushes and leaving the ground bare.

The birds were placed therein and agreed nicely for two months, but nesting season coming on they commenced fighting, and eventually one of the male birds killed the other one. His loss was replaced by another bird and the cage was divided by a wire screen, leaving a pair on each side. They seemed inclined to fight for a while, but ultimately commenced nest building, and one of the birds laid thirteen eggs and was about sitting when a heavy shower washed the nest out and scattered the eggs. We gathered them up afterward and placed them under a bantam and they hatched out, but all the chicks made their escape.

That summer the female bird that had laid the eggs died, and the following fall one of the male birds died. The next spring the remaining pair mated, and the female bird built a nest and laid the same number of eggs as before, thirteen, and commenced sitting on them; but in three or four days she was taken sick and died. During her sickness and after her death the male bird manifested some very singular characteristics. When she was dumpish he would pluck her feathers, seemingly endeavoring to encourage her, and after she died he would smooth her feathers with his bill; then he tried to brace her up, and would run away and call her, made queer noises, etc. Eventually he seemed to realize her death, for he betook himself over to a corner of the cage, where he scratched a hole. Returning to the dead bird by a number of backward movements of the feet, he kicked her body over to the hole and covered her up, leaving only one of the long wing feathers of one wing uncovered, after which, without further demonstration, he returned to the nest and persisted in sitting on the eggs, and at the end of three weeks to a day (Friday, July 24) he has brought out the brood of nine young quail. They can be seen by any one desiring to do so at Mr. Frank Crompton's, Main street, Belleville, N. J. One egg was bad and three were missing.

JNO. H. OSBORNE.

DOMESTICATING WILDFOWL.—Cold Spring Harbor, N. Y., July 25.—*Editor Forest and Stream:* My birds have not laid an egg this season. The wood ducks and mandarins were coupling all winter and spring, but the mallards and pintails showed no disposition to do so. At one time it seemed as if the drake widgeon and the female green-winged teal were about to strike up a match, but nothing came of it. The birds have a run in the yard which contains two fine pools of spring water, each 40x20 feet, with mud, sand, gravel and water plants; there are shade and grass also. They have been fed corn, wheat and buckwheat, and it is possible that they may be too fat to lay. They are very tame and come to the call. As I have had wood ducks lay in closer confinement than these are in, it is somewhat of a puzzle why they have not laid. Last year the minks killed off my flock in March, but this year the birds were housed at night, and there has been no loss from animals. The result this season will not prevent still further trials in the direction of breeding our beautiful wildfowl, and I will add to my flock if occasion offers. Most of the birds are now in summer plumage, and have lost their beauty for a time, but this is not the case with the mallard and pintail drakes, which do not seem to have changed. The male wood ducks have lost their brilliant plumage, while the drake mandarin, the handsomest duck that swims, looks like his sober mate, with the exception of a red tint on his bill.—FRED MATHER.

PRAIRIE DOGS AND WATER.—Danbury, Conn., July 30. —*Editor Forest and Stream:* Mr. W. E. Mallory of this town, formerly a resident of Nebraska, had a pair of these interesting animals sent him last fall to exhibit at our annual fair. Since then he has kept them through the winter in a large crockery hogshead filled with earth and placed in the cellar, and since warm weather in a cage out of doors, with place for burrowing. They were offered water on their arrival here, but have never been known to take any, either upsetting the pan or filling it with earth, grass or rubbish. The past six months or more they have had no water whatever, except such as they obtained from the fruit and vegetable juices of their food, yet they are as well and content as could be imagined. This seems to demonstrate that water is not necessary to their existence. As you have published evidence of their burrowing to water, may it not be that they seek it and its vicinity for some other reason than to drink it?—C. E. FRIEDMANN.

AN ENGLISH SPARROW EXTERMINATOR.—Sergeant Rogers is the keeper of our little Court Square Park, in the center of Memphis. Some one sent him a bird which he calls a stork, captured in Arkansas, and which stalks about the square exactly like Oscar Wilde. The bird is white and looks something like a crane or heron. It stands about four feet when erect. The remarkable feature about it is that it has declined to eat all food offered to it, and sustains itself by gobbling up English sparrows, which it approaches stealthily and seizes by a quick stroke of the bill, swallowing them headforemost. It has eaten no other food for more than a month.—COAHOMA (Memphis, Tenn.).

SWALLOW HIBERNATION.—A Hunnewell's Point, Me., correspondent writes, "I am informed that you offer a reward of one thousand dollars for satisfactory proof that swallows hibernate in the mud. There is an old gentleman here, who is reliable, who is ready to produce satisfactory proof, and will do so next winter for the above-named reward or forfeit one hundred dollars." If we ever did offer any such prize it was a long time ago, and we have forgotten all about it. Perhaps the hoop-snake prize is the one referred to.

DR. THADDEUS S. UPDEGRAFF, chief of the staff of the Surgical Institute at Elmira, died last Monday, aged 46 years. He was an eminent microscopist, and two years ago was made a Fellow of the Royal Microscopical Society of England. He was an angler and an angling writer. The FOREST AND STREAM, in former years, published several communications from his pen. His book, "Bodines, or Camping on the Lycoming," contains some of these papers.

A correspondent of the Los Angeles (Cal.) *Times* reports that along the southern coast of Mexico the people have a habit of inoculating themselves with the virus of the rattlesnake or adder, which renders them absolutely safe forever afterwards from the bite or sting of the deadliest reptiles.

Game Bag and Gun.

BEAR DOGS.

Editor Forest and Stream:

"Bruin" asks about what kind of dogs make good bear dogs. In the winter of 1864–5, myself and partner killed several bears in Minnesota, east of St. Cloud. The dogs we had were a half mastiff and half blue greyhound, weight 94 pounds, and a three-quarter pointer and a one-quarter fox-hound. The first dog was considered No. 1 after bear. The two dogs were sure of their game every time we found a fresh track. The bear could run but a short distance or climb a tree, as one dog or the other were sure to snap him in his hindquarters, so after a few moments he would sit with back against a tree and fight the dogs. The sire of the dog was a blue greyhound and the dam was a mastiff. He was very intelligent, and made a good dog to capture wounded deer. A coon, fox or common wolf was only sport for him, as he was very powerful and active.

Since those days I have hunted in Kansas, the Indian Nation, Texas, Mexico and Colorado; and now I am anchored here on Bellingham Bay, where game is very plenty, but the land game is very laborious to get without hounds. Fish in the lakes and streams are numerous, and in the bays of the same both shellfish and numerous other kind are abundant, and from fall until spring waterfowl are plenty and easily captured. The climate is 100 degrees ahead of any portion of the United States that I have ever seen.

I am making a collection of birds and shells and Indian stone implements, such as may be found on this coast, and will exchange with any party that may feel disposed to do likewise. J. Y. Collins.

Whatcom, Wash. Ter.

Editor Forest and Stream:

Several bears have been seen within a few miles of this place quite recently, and one was killed not far north of the head of Torch Lake, in the early part of this week, near a public road, which he had frequently crossed of late at about the same point. A man named Picknell watched for and shot him. One of the packs of bear dogs spoken of by your correspondents might find work here, but it would be hard to ride to hounds in this neighborhood. Kelpie.

Central Lake, Mich., July 25.

Editor Forest and Stream:

When I read the exceedingly interesting letter, signed "Bruin," in your issue of June 23, I had a dim recollection that the term bear dog was not wholly unfamiliar to me. True, there is no breed known by that name in England now, and as your correspondent says we have no large and fierce game in this country, or we would assuredly have the dogs to tackle them; but the wild boar and the wolf have long ago disappeared from our forests, and we have now to content ourselves with the red deer, the fox, the otter, and the timid hare for our hunting, with the badger and lesser game to try the mettle of our terriers.

Our common ancestors, however, in the rude old days of bluff King Hal and good Queen Bess, and down to a much more recent period, imported animals our island no longer furnished, to act as makeshifts in satisfying the national and natural instinct to indulge in savage sport.

The bear garden and the bull ring are no longer English institutions, but it is to those we must look back to learn something of what our bear dogs were, and perhaps to find the material your correspondent, "Bruin," and his fellow hunters of the bear and other large and ferocious beasts, need in a dog qualified to serve them in these exciting pursuits.

"Bruin," if I understand his letter aright, seeks information and invites suggestions, and it is in the hope that I may be able to help in finding the dog wanted, or to show how he may be manufactured from existing material, or at the very least to help in a pleasant gossipy discussion of the subject that I venture to address you.

Hentzner, a German writer, who witnessed both bull and bear baiting in England, says: "There is a place built in the form of a theater, which serves for the baiting of bulls and of bears. They are fastened behind and then worried by great English bulldogs; but not without risk to the dogs from the horns of the one and the teeth of the other, and it sometimes happens they are killed on the spot. Fresh ones are immediately supplied in the place of those that are wounded or tired." The great English bulldogs were probably what we should now call a bastard mastiff; it is certain that but very few of our modern show bulldogs are fit to face a bear, even supposing them to have the courage, for they have been so bred to the arbitrary standard of fanciers, that with their narrow, upturned lower jaw, and irregular, weak small teeth, many of them could hardly make a mark in a pound of butter, let alone tickle bruin through his rough, thick coat.

The bear dog is by other writers spoken of as the bandog, mastiffs, etc., and John Evelyn, in his diary, refers to the Irish wolfhound in the same connection in these words: "The Irish wolfhound was a tall greyhound, a stately creature, indeed, and did beat a cruel mastiff. The bulldogs did well, but the Irish wolfhound exceeded."

That it was no puppy play to tackle the bear even when fastened behind, may be gathered from Lambam's description of a baiting in 1575. He says: "It was a sport very pleasant to see the bear with his pink eyes leering after his enemies' approach; the nimbleness and wait of the dog to take his advantage; and the force and experience of the bear again to avoid his assaults; if he were bitten in one place, how he would pinch in another to get free; that if he were taken once then by what shift with biting, with clawing, with roaring, with tossing and tumbling, he would work and wind himself from them; and when he was loose, to shake his ears twice or thrice with the blood and the slaver hanging about his physiognomy."

We have still the breeds of dogs that had the courage and endurance essential to bear baiting, but for the most part these qualities have been lying fallow, and it is only in physical development and beauty of form we have improved our dogs of that class. Indeed, in some instances, to a considerable extent, I think, in both mastiffs and bulldogs, essential qualities have been partly sacrificed in favor of arbitrary points.

After this long preamble allow me to offer a few suggestions on the formation of a pack of powerful, courageous and hardy bear dogs. First of all I would call the attention of "Bruin" and others interested in the sport to the work now undertaken in this country by the recently formed Irish Wolfhound Club, of the resuscitation of the old and, if not world famed, at least European famed Irish wolfhound, of which Stainhurst, in his description of Ireland, 1560, says: "They (the Irish) are not without wolves and greyhounds to hunt them, bigger of bone and limbs than a colt." Now it is not contended that there now exist Irish wolfhounds of absolute purity, but that there remains in the hands of a few, dogs with sufficient of the old and and true blood to serve as a foundation for the restoration of the breed. I believe one of the crosses resorted to in the resuscitating process is the Great Dane, a breed that not improbably has some of the Irish wolfhound blood in him.

In working up to the standard of form and size they have set for themselves, this combination of breeders must of necessity have many dogs whelped in their kennels that, being less likely than the others to suit for further breeding toward the standard, will be drafted. Now, I venture to say that this combination of the blood of such large and courageous breeds as the Irish wolfhound, Scotch deerhound and Great Dane or boarhound of Germany would make, in many respects, a most excellent bear dog. These drafts would not, I imagine, be expensive; an important consideration where a pack are to be used under conditions in which many of them are sure to come to grief.

Although all breeds of dogs learn to use the nose, it may be that your bear hunters would want an infusion of that quality from a breed in which it is intensely developed; and in that case I would strongly recommend seeking it in the pure English bloodhound, for through this cross there would not be the loss of size likely to arise in crossing with the fox-hound.

I see "Bruin" is trying a cross with the bull-terrier; but that will lead to great loss of size, and I should say instead of the bull-terrier use the bull and mastiff first cross, a fiercer and more indomitable dog is not bred; perhaps he is even too much so, but for crossing I think not.

I can see no reason, if American hunters of big game would co-operate, why a breed adapted to all their requirements should not in a very few years be established and of such distinctive characteristics as to be relied upon to reproduce their like in physical and mental characteristics bred *inter se*.

It is very probable that the Irish wolfhound, as I hope to see him resuscitated by the club, might be the most suitable dog possible for "Bruin's" purpose; and if that is likely why should not Americans co-operate with the Irish Wolfhound Club in its work? There are many gentlemen in the United States of Irish descent whose instincts as sportsmen should stimulate them to take part in so commendable a work as the restoration to us in all his pristine grandeur of the king of dogs, the old Irish wolfhound.

There are other breeds that might well enter into the composition of the bear dog, such as a judicious commingling of the blood and qualities of the large Pyrenean wolfhound, the Siberian wolfhound or barsee with our English mastiff and bulldog and a dash of bloodhound to give nose.

I may mention that the honorary secretary of the Irish Wolfhound Club is Capt. G. A. Graham Dursley, Gloucestershire, England, who has long indentified himself with the Irish wolfhound question, who has just published a most interesting *brochure* on the subject, and would, I am confident, give "Bruin" or other American sportsmen every information and help in his power. Corsincon.

England.

TENNESSEE DOVE SHOOTING.

Editor Forest and Stream:

A party of us had a very enjoyable dove hunt last week in the vicinity of Memphis. Mr. McCallum, Registrar of Shelby county, a genial sportsman and hospitable gentleman, invited a party to drive out with him to his farm, about fourteen miles east of town, where he had a hundred-acre wheat field, upon which the grain had been recently cut, and where great numbers of young doves were congregated. (The game laws of Tennessee do not protect doves.)

Our party consisted of ten gentlemen, among whom were Capt. Geo. Bookout, one of Mississippi's champion shots, and Dr. Peterson, a Texas champion. These two gentlemen had met here by appointment to shoot a pigeon match for a large stake, but failed to secure the necessary birds for the traps. There was also in the party Capt. Chas. DeGaris, a local sportsmen, who we think would push either of the above champions very closely in a match. So there was promise of a very lively contest for the honors of the day.

We left Memphis at 5 A. M. in drags and buggies, with good teams. The road is excellent as far as Raleigh Springs, nine miles distant, where we arrived at 6:30. Here we halted for breakfast, which we had in the elevated and airy hotel, and the early drive sharpening our appetites, we did full justice to the ripe cantaloupes, raw tomatoes, fresh milk and butter, broiled chicken, etc.

After breakfast we drove the remaining five miles over a rather rough and hilly road, arriving at Mr. McCallum's ranche at 8:30. The first thing to do was to prepare a pail of ice water, and uncork the demijohn of good claret, which our worthy and appreciative caterer, Nick Maletesta, had brought along. After refreshing ourselves, and having turned out our horses in the beautiful grove which adjoins the farmhouse, with good store of fresh grass for their delectation, we repaired to the wheat field, about a quarter of a mile distant.

Wheat growing is exceptional in this locality, and this is probably the only field for a considerable distance around, so that all the doves in the country about were congregated here. In a very few minutes this wheat field might have been mistaken for a battle field from the constant belchings forth of ten breechloaders. The doves were about three-fourths grown. They flew very rapidly, and soon got quite shy from so much bombarding.

We kept up the fusilade till noon, notwithstanding the extreme heat of the July sun and no shade available. It was somewhat ameliorated, however, by the ministrations of a Senegambian subsidized for that purpose, who constantly circulated among the combatants, facing death in many shapes, with a bucket of ice water, and who fittingly represented the *vivandière* of French battlefields.

At noon we all repaired to the farmhouse and refreshed ourselves with iced claret, "Lincoln county," peaches and melons.

After partaking with keen appetites of a first-rate, genuine country dinner, we lolled around in great enjoyment, relating how many birds each had killed and couldn't find, how many were killed at fabulous distances, etc., and Nick Maletesta had one fall into a puddle, and it was carried under "by a turtle or something." About 2 o'clock there came up a hard shower, and it continued to drizzle during most of the afternoon. Nothwithstanding the wetness we again took the field, which soon resounded with lively skirmishing.

About 5:30 we reluctantly drew off, most of us being "out of shells," and proceeded to show up our respective bags. Capt. De Garis led the score with fifty-three birds. Capt. Bookout came next with forty-four. Dr. Peterson, the Texas champion, was non-committal, so it is presumed he fell below those figures. Mr. Cannon, the worthy sheriff of Shelby county, brought up the tail end with a score of three birds. He also offered many excuses and explanations though, all of which were cheerfully accepted. The whole bag numbered 225 birds.

Having gotten our drags and buggies in readiness, we had a pleasant moonlight drive back to town, Capt. Bill Forest (son of the Confederate cavalry general) taking the lead with his spanking team of high steppers. We arrived at home at 9 o'clock, and after a good bath this member of the party slumbered in such blissful repose as only a weary sportsman knows. Coahoma.

Memphis, Tenn.

OVER-SENSITIVE PRIMERS.

Editor Forest and Stream:

At one of the tournaments held at Wellington, Mass., I met with an accident which you or your readers may be able to account for. It occurred in a double bird match. I was called to the score, loaded and cocked both barrels, both birds being sprung. I pulled on the left bird with the left barrel and fired. Both shells exploded, alarming me somewhat and injuring the forefinger of my hand quite seriously. Instantly turning on my heel and facing the shooters, said: "Gentlemen, you will please observe the condition of my gun; both shells discharged, the left hammer down, the right at full cock." I then broke open the gun, finding the shell in left barrel well indented, while the one in right barrel was slightly so. The gun is a 10-bore, 10 pounds, top snap, heavy strikers or plungers, without springs, and made by one of the oldest and best gunmakers in New England, and presented to me by my brother sportsmen last fall. Similar accidents have occurred during the past six months at tournaments when I have been present, and all first-class guns, but in every instance the guns had heavy strikers.

Now I ask, what caused the other shell to explode? The accident was quite a shock to me, and seriously disturbed my shooting for the balance of the day.

Some twenty years since I pulled off both barrels by my finger slipping from the forward trigger, and from that date it has been my invariable practice to shoot the left barrel first in double shooting in the brush, and in single bird shooting at the trap. Have never heard or known of an accident of this nature on guns having strikers with springs, while with the heavy positive plungers four different times has it occurred when I was present. Several theories have been advanced. Can any one tell me to a certainty?

C. H. Gerrish.

Exeter, New Hampshire.

[The probable cause of the premature explosion was that an over-sensitive primer was exploded by the shock of the firing of the other charge.]

A BEAR SUIT.

A GENTLEMAN who lives in this village returned a day or two since from a week's trout fishing in Potter county, Pa., and relates the particulars of a most amusing and novel lawsuit, at the trial of which, before a backwoods justice of the peace, he was present. Three weeks ago two young Philadelphia sportsmen visited the region and camped on the headwaters of Kettle Creek, where they expected to remain. On the evening of the second day they made their appearance in the village carrying between them on a pole a large bear which they said they had killed after a long chase and a hard fight. They became the heroes of the backwoods settlement, but for some reason they had decided not to stay in the woods as long as they had intended to and left for home next morning, taking their shaggy prize with them.

One day last week an old woodsman named Cary Bonear, who lives in the mountains ten miles from any settlement, applied to the justice of the peace of the township for a warrant for the arrest of John Hines, another hunter and trapper, who was charged with appropriating to his own use "one black bear, the property of the said Cary Bonear," the complainant basing the charge on the affidavit of George Hines, a cousin of John Hines, the affidavit being made on personal knowledge. The warrant was served and the prisoner was found working in the bark woods and arrested. He was taken before the justice, where the proceedings in the case tell the story.

The prosecution called Cary Bonear as the first witness. He swore that on the Fourth of July, a tame bear, three years old, that he had raised from a suckling cub, had broken the rope by which it was tied, and had escaped to the woods. The witness at once began a search for it, and on the 5th of July had met John Hines in the woods, where he was at work, and had told him of the escape of the bear, at the same time requesting him to keep a lookout for it, and to be careful and not shoot any bear he might see in the woods until he had satisfied himself that it was not the witness's tame bear. Bonear said he had told Hines that he would give any one $5 who would return the bear unharmed. He valued it at $40. The bear was not found, and on July 18 George Hines had informed him that John had found the bear in the woods on the 5th, and had sold it to two city fishermen for $20.

George Hines was next sworn. He testified that on July 6 he was helping his cousin John in the bark woods. At intervals during the day they heard peculiar cries that came from the valley of the creek, and which they supposed were made by some bird or animal a mile or so away. Late in the afternoon, the sounds still being heard, witness suggested that they go down in the hollow and see what it was that was uttering the cries. They went down in the direction of the sounds, which became more distinct as they drew near the hollow, and they presently discovered that they were made by human beings evidently in distress. The witness and John Hines hastened their steps, and soon came to the Burned Mill cabin, on the creek, and there found two men in the crotch of a small chestnut tree, calling lustily for help. At the same time a large bear came deliberately out of the cabin. The men in the tree called frantically to the two woodsmen to kill the bear, and John Hines was about to shoot it when it made a move by which the two recognized Cary Bonear's missing tame bear. The witness and his companion told the frightened men in the tree that the bear was harmless, and

they came down. They said that the bear had jumped into the cabin soon after they got around in the morning, and, supposing it to be a hungry wild one, they had both hurried out the back way. The bear followed them, and they lost no time in getting up the tree. The bear had lurked around all day, and they were afraid to come down and tackle it, as it kept between them and their guns in the cabin. They had been shouting for help all day. The two men were campers from Philadelphia, and they were so mad over being treed by a tame bear that they offered witness and John Hines $20 to be allowed to kill it. The two woodsmen held a consultation, and finally decided to accept the offer. The fishermen handed over $20 which John Hines accepted and put in his pocket. The fishermen shot the bear and took it with them out of the woods. John Hines said nothing about dividing the $20 with the witness, and after asking him for it several times and getting no satisfaction, he had gone to Cary Bonear and told him the whole story about the tame bear and what had befallen it, on the condition that the witness should not be held accountable for the part he took in disposing of the animal.

John Hines admitted on oath that he had received $20 from two strangers on the 6th of July to let them shoot a bear he and George Hines had found in the woods. He hadn't divided the money with George because he been short of money, but he considered that he owed George $10, which he intended to pay him as soon as he got pay for his bark. As to the bear being Carey Bonear's he couldn't say. That, he said, was for Bonear to prove. This the prosecutor was unable to do, and the justice decided that "bears isn't property, anyhow, and if they was there isn't no cause of action in this case," and the prisoner was discharged.

The lawsuit created a sensation in the backwoods region, and all the inhabitants within a radius of many miles were present to see how it came out. Much bad blood has been engendered by the result, and the general impression is that there will have to be two or three big fights over the case before it is settled.—*Olean (N. Y.) correspondence New York Times, July* 28.

THE ST. LOUIS CONVENTION.

MUCH interest is shown in the convention of sportsmen at St. Louis, Sept. 25. The *Republican* of that city has the following in regard to the meeting, we do not know with how much authority:

"To return, however, to the main object of the convention—that of devising means to obtain uniformity in the fish and game laws of the whole of the States. It might at first be thought there could be found no difficulties except those consequent on latitude and climate, but directly the broad principle of a common preservation is approached it will be seen that it is surrounded by a belt of very prickly thorns. The persons interested in game preservation are: The farmer, on whose land the game is raised; the sportsman, who wishes to arrest the wiping-out process at present pursued; the consumer, who purchases game for food as a delicacy or as a help toward health, and, finally, the dealer, who has embarked his capital in the game business. All the market hunters who work for the dealer and who might be mustered in their thousands, count in with him. Farmers are generally kindly disposed to those sportsmen who treat them civilly, and as they are also generally amply protected by the laws of trespass, those of them who are not actually enlisted among the shooting class themselves need not be further thought of in connection with the subject of this article.

Hitherto, that is of late years, the dealers and sportsmen have worked together. Neither class could have accomplished separately half the good that has been arrived at between them and it would appear that in the West at least the dealers have been so thoroughly loyal to the sportsmen that they have gradually forced the separate interest of the consumer out of the field and incorporated it in their own. They have refused to supply game out of season and with the refusal the demand has ceased. This fact has therefore narrowed down the interests concerned to two, the sportsmen and the dealers. Their joint efforts and their hand-in-hand action have procured in most of the States legislation which has been most satisfactory all round. The market hunter (proper) has found his out-of-season-game vocation gone as soon as the dealer would not receive his bag, and the sportsman found a corresponding increase in the game he met with in the following open season. It appeared a few months ago that the unwritten treaty between the two classes would never be broken, the tie between them being that of mutual interest, and it is likely enough that nothing but over-legislation will bring about such a rupture—one to be regretted by all—for it is one which will cause all those interested to suffer. The Eastern game dealers at the beginning of the year put their heads together and formed "the American association for the protection of game, game dealers and consumers." The avowed object of the corporation is that "of so arranging the laws, State and national, that game killed in season may be sold and eaten without restriction as to time, and game protected from annihilation." The *raison d'etre* of the association was the fact that dealers in New York saw that while the thousands which they had invested in their business were lying idle, owing to the fact that the sale or even the mere possession of game in the close season was an offense punished by extremely heavy fines in their city, yet in Boston, close by, game could be sold right along, provided the close dates of Massachusetts itself had not been violated by the act of killing game within its borders. It is extremely improbable that Western dealers would or will lend themselves to the fight between the game dealers of those cities, provided they are fairly treated themselves; but if they are so legislated against that their business is taken from them without any apparent necessity, it is full likely that they will be forced into an antagonism with sportsmen which will replace the previous healthy alliance between the two. There can be no doubt but that the majesty of the law can be so exercised that it must in the end overcome a defiant game dealer whose underground railroad routes for game must be detected sooner or later; but it may be asked if it is not better to look into his side of the question before forcing him into an opposition from which he will probably come out second best, but into which he should never have been driven.

The object of the convention is clearly laid down by the published circular, but it may be accepted that the root of the principle which it will adopt is the production or the selection of a body or bodies of men whose experience and sound judgment in respect to the subjects they take in hand shall be such as will lead any or all Legislatures to look to them for almost infallible opinions and absolutely correct advice in regard to game and fish preservation. In many cases the laws connected with the game question contain so much that is nonsensical that it is no wonder that they are a dead letter, nor is it a matter of surprise that dealers and even shooters are often driven into efforts to evade their provisions. In this regard it is clear that each and every State cannot but benefit by the selecting of a number of gentlemen to whom the Legislature can safely apply for suggestions and guidance in the framing of laws about game and fish preserving, and the whole country will benefit in the same way by a wise extension of a common principle to all. How necessary such a board of advisers is to a Legislature may be learned in a very few words. Those of our St. Louis citizens who wish to occupy twelve hours of leisure in the pursuit of prairie chicken must seek their sport in either Illinois or Missouri. The Legislature of the former State provided at its last session for the entertainment of a number of game constables, and it has tacked to its proper and wise measures for game preserving one that makes the possession of a bird out of season a crime. It then adds the delicious absurdity that a game constable shall seize illicit game wherever he can, and shall at once dispose of it at public auction. A is caught *flagrante delictu* with six grouse; these are sold to C and D by constable B, who should at once seize seize C and D for unlawful possession. In Missouri the absurdity of the game law, as passed by the last Legislature, is still greater. The various clubs in the State have determined that tha laws, right or wrong, shall be acted up to, and the officers of several of the sportsmen's associations already have their eyes upon different dealers in the city, and will prosecute to conviction wherever possible. The Legislature this year altered the opening of the grouse season in Missouri to the 15th day of October. This law says, therefore, that practically scarcely a single prairie chicken shall be eaten in the State this year. All of those who know the habits of our prairie grouse are aware that they pack in large flocks after the first heavy frost; that they then become extremely wild and almost invariably rise out of shot. We generally experience more than one sound frost before the 15th of October, and as the fall business has generally well commenced by that date there will be found but very few gunners, either sportsmen or hunters, who will wander to the west of the State for half a dozen doubtful shots a day. It is difficult to understand why the opening day has been set back so far. The sportsmen don't seem to appreciate it, the marketmen no doubt hate the change, and there is little doubt that the public will send up a howl when on the next mid date of September they find that they have to look forward a whole month for a delicacy to which they have become accustomed at that special season. It must be remembered that the possession of a grouse, even if it comes from the Indian Territory, is as rigidly punishable as is the killing of one on the nearest piece of prairie. It is not easy to find any one who will say that the opening of the season was so postponed on account of a diminution of the head of grouse in the State, and there is no doubt that no such special cause for a change existed, but even had it been the reason for a special act of legislation, it would have been easy to add a special rider to the bill to the effect that game exhibited and registered as such on entering the State should be marked in some way or other, and that its possession should not be unlawful when declared. The trivial expense incurred might easily have been recovered from the dealers. If Missouri had possessed a board of sportsmen to which the Legislature could have turned for advice, no such absurdly late date as Oct. 15 would have been insisted on for the opening of the grouse season, and neither dealers nor the public would then have had occasion to look on themselves as ill-used. It is quite possible that the American association alluded to above will take a hand in testing the constitutionality of a law which keeps articles of merchandise out of a State, and the results of such actions in other parts of the Union do not point to any great probability of the wisdom of the Legislature being upheld by the United States courts.

It is probable that the convention will be asked to suggest that the officers of the various fish commissions be merged in those for the protection of both fish and game.

QUAIL IN THE HAY FIELD.

Editor Forest and Stream:

An affair in my experience that occurred some years ago in relation to the destruction of setting quail in the hay field, may be of interest to those who wish to protect broods so situated. I had come in possession of my first pointer. As she was unbroken, I undertook the job with the assistance of books and such other information as I could gain from one or two who shot on the wing over trained dogs. Single quail were to be found in every lot and clearing, so we did not lack for material. One day in a hay field Fan found three sitting birds. Two of them covered sixteen eggs each, the other twenty-three eggs, the largest number I ever met with in a single nest. It seemed to me a great pity to have their nests destroyed, as they surely would be within the week, when the field was to be mowed. I immediately took steps for their protection, by driving sticks that reached well above the grass, and described a circle of ten feet or more in diameter around each nest. The mowers respected the boundary lines, and to our pleasure and surprise, each bird remained with her charge.

Five days after haying was over, in company with Fan we visited the locality. In and around the two smaller nests there was plenty of scent and there were broken egg shells, but no birds. After a short search in the vicinity we found numerous young peepers, some of them made frantic efforts to buzz off, but soon fell back on the best and most effectual game of skulk. On the large nest Fan came to a point, and peering through the grass we plainly saw the old hen on the nest. Three days after this we again visited the nest. The hen was gone; there only remained a lot of broken shells and three addled eggs, so I think we are correct in stating that fifty-two birds were the reward of this operation. As these three broods remained in the neighborhood of the farmyard we did not disturb them. There were numerous bevies on every farm and clearing in all quarters, and none to disturb them until winter with the trap; boys came on the field about the middle of October, I am certain. These protected birds wintered in one gang, and remained so more or less of the time until the pairing season in March. They were daily visitors to the outhouses and garden, and so tame as never to fly or skulk, in the usual way, on the approach of person or dog. When the first heavy snows came we placed a quantity of cornstalks in the form of a large hollow shock in an open field near the barn; it was always supplied with wheat and other grain screenings. This place was regularly visited by them, but they never remained over night, always taking to the adjoining grass fields or low scrub as twilight set in. They know best where to spend their nights out in safety. The last I saw of these birds was in early March, when I counted the tracks of twenty two birds, enough certainly to stock a good piece of country.

DR. E. STERLING.

CLEVELAND, OHIO.

THE FORESTS OF UPPER COOS.—Connecticut Lake, N. H., July 27.—*Editor Forest and Stream:* The article in last week's issue by Dr. Prime on the failing Connecticut, will apply to the valley of Ammonoosuc twenty years ago; but where on all the branches of the Connecticut have one thousand acres of pine timber been cut off, and where has the lumber been sawed in that number of years? Pine stumps are not an easy article to remove and in Upper Coos I have seen but few, and it is here that the greater portion of forest cutting has been done within the last ten years, and spruce trees alone have been the object of interest; and care is taken to cut only those over eight inches in diameter. I think it a safe estimate to make on all the lands cut over during the last ten years on the Upper Connecticut and its tributaries less than 25 per cent. of shade-producing trees, and where ten years since millions of feet of spruce were cut from the vicinity of Lower Connecticut Lake the shade of the forest is sufficient to deceive any but the spruce-tree hunter, so dense is the foliage of birch, maple and fir trees that have extended their branches to fill the vacant spaces. The lands are now owned by parties and companies who are guarding against forest fire by employing men for the purpose when there is danger of its spreading. I remember to have seen Dr. Prime at Colebrook, N. H. If he can tell at the distance (one mile) across the valley at that point where "bleak masses of rocks" have taken the place of tree cutting, I would like to see it. The forest owners of to-day are men who know the value of their lands in Upper Coos, where birch cannot be taken to market profitably via the "canal," and no other conveyance is at hand.—NED NORTON.

SMITH AND THE GAME CONSTABLE.—A correspondent to the Philadelphia *Telegram* reports: "Paul Smith, the well-known hotel man of St. Regis Lake, talking to some of his guests a few weeks ago, said: 'They wanted me to go to Albany and see what I could do to kill the bill. I went. When I got there I was asked, "What is it worth to have this bill defeated?" That was enough for me. I came home at once, for I thought it would be cheaper, when I wanted to do some deer hounding around Lake Regis, to give our game constable $40 and send him away on a visit, than it would be to buy up the Legislature.' The sentiment among such men is very strongly expressed against Governor Hill, who signed the bill, as they vow they will not vote for him if he is nominated. The law will be violated to a considerable extent, but its effect will be good in keeping the wilderness in its present wild condition. Hotels increase there all too rapidly for the accommodation of non-sporting guests, and they will close earlier if the deer-slaughterers do not come. Meanwhile the deer will increase in numbers, and sportsmen who enjoy hunting them in a sportsmanlike manner will reap the benefit." The game protector is Peter B. Leonard. We should be pleased to hear from Mr. Leonard in reference to this speech of Paul Smith.

EATING PRAIRIE CHICKEN EGGS.—Emmetsburg, Palo-Alto County, Iowa.—*Editor Forest and Stream:* I have been here over a week now, and find chickens very scarce. What few coveys there are have full number of young birds, but I fancy the breeding stock of old birds must have been very limited. I have had letters from several points in Nebraska and Minnesota, and the same general complaint is made. To one who can look back only four years ago and remember the almost unlimited quantities of this noble bird that then stocked the prairies, and then see it as deserted as it now is, the retrospect is indeed sad. It is not only the breechloader of the city sportsman—though that has undoubtedly been a potent factor in the exterminating process—but the burning of the prairies in the spring after the birds are setting destroys hundreds of broods. Then again the herdboys rob what nests they find, breaking some of the eggs to see if they are newly laid, and building fires on the plains and wasting and eating the eggs. Then almost every farmer owns a gun and makes it a point to have a mess of chickens as soon as they are large enough to fly up out of the grass. I see nothing ahead but complete extermination for these grand birds.—N. B. N.

BAY BIRD MOVEMENTS.—Philadelphia, Aug. 2.—The flights of curlew, brownbacks and creakers have been good during the past week. Many of the first named have passed down the coast in bunches of ten to twenty. Few, however, if any, of the varieties have been killed. The mosquitoes on the meadows are simply horrible in numbers and bloodthirstiness. A good and strong south wind now will bring more birds and will keep down the mosquitoes and make matters bearable. Parties that wish to have a good time with the bay birds had better go to Ocean City, Sinnepuxent Beach, during the first ten days of August. The fashion for ornamenting ladies' hats with small bird skins is declining, and the use of the long shafted wing and tail feathers of much larger species is coming in. This is good; the bay birds will have a rest, not, however, as they should until all spring shooting ceases. Grassplover are flying over Philadelphia at night in goodly numbers, so their whistles heard before daybreak and through the wee sma' hours would indicate.—HOMO.

A TEXAS GAME COUNTRY.—I have just made a trip of pleasure to see what lay between Harrold, Texas, the terminus of Fort Worth & Denver City Railroad, and Fort Sill, Indian Territory. I struck out over prairie till I came to Deep Red. There I camped for the night with plenty of firewood. Early next morning I was up after turkeys, and found them plentiful, killed three for breakfast; saw several deer. Leaving Deep Red I was on prairie again for over twenty miles; saw numbers of quail; also several herds of antelope. Stopped on a small creek for the night and killed several plover for breakfast next day. At noon I saw Cash Creek with plenty of timber on both sides its banks. Turkey signs abounded, and I saw a heard of over two hundred antelope feeding out into the open. Quail appear to be everywhere, from every thicket I heard Bob White. From Cash to Sill antelope were in view on side hills. It is a sportsman's country all over. I reached Fort Sill, and should give the distance from fifty-eight to sixty miles, and from five to ten miles shorter than from Henrietta.—ALMO (Harrold, Wilbarger county, Texas, July 28).

Chilled Shot.—In your answer to "Tinker," Decatur, Ala., in Forest and Stream of July 23, 1885, as published, are you correct? I think "chilled shot" do "preserve their form better, and so fly truer and make much better pattern," and superior penetration. Were there not superior penetration in chilled shot, which, as I understand the matter, are merely hardened shot, why should a rifleman expect superior penetration from a hardened bullet? I will further say, I consider for common purposes chilled shot, equal in effect to two sizes larger of common shot. In other words, chilled 12's equal in killing power to common 10's, but there is one point to notice, viz., the lighter single pellet of smaller size may not carry so far as the heavier, but the chances are equalized when one remembers the increased number of the smaller required to make up the weight.—Amateur. [The answer was plainly erroneous—the "not" having crept in in some way quite beyond understanding.]

The Big Buck of Buenaventura.—San Buenaventura, Cal., July 20.—Deer hunting is in full blast (if I may use the expression) and deer are brought into town almost every day. The largest buck ever brought into Ventura was killed two days ago. His antlers measured nearly four feet from tip to tip. They were about two and one-half inches thick at the base. One horn had three points and the other two. Although he was not weighed, many estimated him to weigh over two hundred pounds. He had been known for years, but was killed in six miles of town. A few deer have been killed five or six miles from town. Quail are here by the thousand.—Typo.

Cahoot.—Coralville, Iowa, July 28.—*Editor Forest and Stream:* I saw in Forest and Stream you wished the common meaning of the word "cahoots," or in what way it was used. Here it is used to indicate an equal division of the spoils of a hunting or fishing trip, or other transaction that two or more persons may be engaged in. I have never heard it used with any other meaning attached.—John Williams.

Moscow, O., Aug. 1.—The outlook now for good hunting next fall is first-class. Young quail are numerous, and rabbits, squirrels, etc., are very plenty. Fox chasing is the favorite sport here, the country being hilly and well suited for such exciting sport. Any person wanting good quail shooting can find it here in season.—G. G. J.

Hunting Club Rules Wanted.—Huntingdon, Tenn.—*Editor Forest and Stream:* Some weeks ago it was asked through your columns if some one could not give a copy of the by-laws of a regular hunting club. If you could publish such a thing it would be good reading for many.—H.

The Bear Supply of this country was augmented last month by the arrival of a band of French gypsies with ten bears and a dozen monkeys. The commissioners of emigration sent the whole lot of them back to France, so the that bear census is just where it was before.

New Jersey Game.—Hightstown, N. J., July 22.—The prospects for game in New Jersey were never better. Quail specially abundant. Our gunners are bringing in good bags of very poor woodcock.—T. A. B.

The Chamberlin Cartridge Co. issue an illustrated catalogue embellished with pictures of game birds and giving particulars of their fixed ammunition.

The Michigan Sportsmen's Association will shortly issue its annual book.

Sea and River Fishing.

Address all communications to the Forest and Stream Publishing Co.

FLORIDA SUMMER FISHING.

THERE had been a week of almost incessant rain. Everything was wet, damp and uncomfortable, and the river had become a mighty stream but little affected by tidal changes. But the fact remained that the ranch was suffering for fish. A meeting was held and "Tarpon" was unanimously elected a committee of one to supply the want.

The Linnie M. was on the ways for repairs, so the Bucktail was launched, the big rod jointed, the best spoon selected and burnished, and the committee started. The current is strong and the two miles between wharf and fishing ground are soon passed over. With good courage the spoon is sent astern, but not for long; five minutes suffice to fill the hooks with grass. Clear them and try again. No use, the river is full of floating grass, and after a half hour of patient endeavor the line is reeled in and the committee is skirmishing for bait, for we must have fish. Crabs are not to be had, minnows are hard to catch, but fiddlers are plenty, and they make good bait for sheepshead. So we'll get some fiddlers.

While searching everywhere for the needful bait, we overhaul an old wreck that was abandoned some six months ago. It is completely honeycombed in places by the *Terado navalis*, in others covered with masses of grass and barnacles.

Not succeeding in getting either crabs, minnows or fiddlers, the expedition had well nigh failed, but while almost in despair, a dingey rounds the point and bears down upon the disconsolate crew of the Bucktail. In the stern of the dingey is piled a long net, in the bow stands the motive power, in the shape of a sharp, wiry "Keywester," Watkins by name, the local fisherman and a good one. The problem was solved. We would go on the outer beach with Watkins. No sooner thought than done. The Bucktail is tied up by the nose and we are off. Thanks to the stout pole and strong arms of my friend we are soon out of the river and skirting the outer beach, we have not far to go. A school of mullet are soon seen rippling the water like the catspaws in the van of a summer's breeze. Getting directly off shore of the school, I jump overboard with one end of the net, while the boatman, making vigorous use of the pole, shoves the boat around and toward the beach. In the meantime I am tugging away at my end, and we soon meet, thus completing the circle, and as we think we have them, the fun begins. Did you ever see a flock of sheep go over a wall? Yea, verily, then you can imagine how those mullet went over that net. All of them? Well no, there was one sick one that couldn't jump; we got him, but we let him go again.

No use to mourn, there are more fish in the sea. So piling in our net we go on. Soon we sight another school, but they seem to be more compact. Following the same plan as at first, we are soon tugging away at the net again. All at once Watkins wakens, bending to his work with all his might, he yells: "Redfish! Go! Go! Double the net:" Around we go and soon have a double wall of strong twine around a compact body of redfish, estimated at from one hundred and fifty to two hundred. Now we have business. Redfish don't jump the net, but they lunge from side to side, and if they once get an opening made, good-bye.

Standing waist deep in the water, it is no boys' play to pick up a forty-pound fish and put him in the boat, and so I found it. The only way is to get your arms around him and hug for all you are worth. The first one I tackled got away from me, but it was the last one that did. We took out twenty-five when Watkins says, "Stop, we have enough." I was surprised! A market fisherman to stop fishing just because he had enough, when I have known sportsmen to kill as long as there was anything to kill. We let the rest go, and setting our sail were soon back in the river. Casting adrift the Bucktail, a half hour's use of the paddle and I am at home. There is once more rejoicing in Tarpon Ranch. Tarpon.

Tarpon Springs, Fla.

BOW RIVER TROUT.

THREE kinds of trout abound in the surging waters of the Bow, District of Alberta. These are the well-known brook trout of the East, the "mountain" and the "bull" trout. The latter names are purely local, for they all come from the headwaters in the heart of the great Rockies, and as yet no technical names have been assigned to the Bow River species, at least to the two kinds which I have especially designated.

The brook trout, so toothsome to the Eastern epicure, is, however, a rare fish in the Bow waters. Only a few specimens so far have been caught, but there have been sufficient to prove that he exists in the cold waters of this mountain-fed stream. A year ago Mr. Whitcher, well known all over Canada, and in fact, in the older States, for his connection with the piscatorial interests of the Dominion, made a hurried visit to the district, and he spent several days on the Bow making a canoe voyage to Medicine Hat on the Saskatchewan, and obtaining information respecting the finny inhabitants of the Bow, but whether his report has yet seen print or not I am unable to say, as it has not yet made its appearance in this latitude. I am therefore compelled to adhere to the local terms "mountain" and "bull" until Mr. Whitcher or some other expert further enlightens us as to the nomenclature of the species of the great salmon family which frequent these waters.

The "bull" trout looks more like a "haddock" than a distinct member of the great salmon family. The only part of him that looks like a trout is his head and mouth, which are unmistakable. Sure he has the "spots" or "speckles" which are inseparable from the species, but he has also a broad black stripe along both sides of his body which give him a decidedly "haddock"-like appearance. He is caught at all weights from two to forty pounds. He is as energetic and as powerful as a salmon, and takes the fly or bait with a jump and a rush which mean both work and sport. The biggest fish are caught as the headwaters of the river are reached. In the vicinity of Calgary the bull trout is seldom caught weighing over ten pounds. The explanation of this is that the large ones rarely venture below the falls and rapids which are numerous in the upper reaches of the Bow, and the lower stretches are being well fished. The bull trout, though good eating, has not the flavor of the trout. Its flesh is more like that of the pike, it is mawkish and watery.

The "bull" trout, however, affords a great deal of sport, for when he takes the hook he has no wish to remain. He suddenly discovers that he has business elsewhere, and he accordingly proceeds at once to attend to it. If you are an experienced angler you know how to take care of yourself; but if you are only green at the business, the other end of the line is sure to get away with line and rod at imminent risk to the angler. An Ottawa Senator, whose corpulency was a great drawback to his "fishing weight," last summer had an incontinent swim after his rod on the Bow. A bull trout took hold of the "far end" in the usually sudden way, and, having unreeled the "spare," managed to reel the Senator off the bridge, where he had taken a firm hold. As the Senator rose to the surface of six feet of water, his face looking like a rising sun, he grasped a friendly birch and remarked that the bridge was safe. It was an iron bridge on the Canadian Pacific Railway, and the Senator to this day entertains a strong suspicion that unless he had let go his hold of the structure the bridge would have gone too. The rod and line had gone, so had the bull trout, and the Senator had found the Baptists; but the bridge was safe. The Senator was a Conservative in politics and a supporter of the C. P. R., but it is not likely that he will repeat the experiment this year when he comes on his holidays.

Fat men undoubtedly have their advantages when in water. They will float, where a thin, bony individual will go to the bottom like a stone, but they are "treading dangerous water" when they are angling for bull trout off an iron railway bridge on the Bow River.

The "mountain" trout is seldom caught weighing over four pounds. He is to all appearances a genuine trout, but the fish has not the rich pink color, nor has it the flavor of the Eastern variety. The pink tinge shows itself here and there on the body, but it is not so distinct as that of the third variety occasionally found in the same waters, and which bears an almost complete resemblance to the brook trout of the East.

The "mountain" trout is the most plentiful, and the kind that is most frequently caught.

The spring of 1885 in this latitude set in unusually early. On the 28th of March, Dominion Timber Inspector Gouin, brother of Mr. Gouin, long proprietor of the Russell House, Ottawa, and now postmaster of that city, caught eighty-three pounds of "mountain" trout, varying all the way from four ounces to three pounds. They were all of the "mountain" variety. The "speckles" on the "mountain" trout are small and numerous, but not distinct.

It is the fish which the tourist finds on the hotel tables along the line of the Canadian Pacific Railway, from Medicine Hat to Golden City, British Columbia.

Mr. Gouin made his catch on the 28th of March with a little dark fly resembling a grub. In May and June there is a small dark grub about half an inch long, on which both the bull and the mountain trout feed voraciously. There is also a small, black water bug which is a favorite bait. In July, August and September the grasshopper is sure to take, and the local sportsmen avail themselves of a fly made to resemble a grasshopper, which takes well.

Mr. Gouin has noticed a peculiar fact with regard to "mountain" trout. He has found them more or less in spawn from May to October. Climatic difference, owing to sudden changes in the altitudes of the mountainous region, may account for this, but he vouches for it as a fact.

The fishing season in these waters lasts from April to October, though during the short interval of the freshets, which occur in June, when the water becomes muddy, the trout disappears; suckers, pike and a species of grayling are, however, very plentiful during the high water; but the trout reappears when the waters subside, for these again become clear as crystal, and as suddenly so as they became murky when the rise began.

During the high waters, caused by the heavy June rains, the trout hunt the deep spring holes where the water maintains itself comparatively pure and clear. A baited hook dropped into these holes during a freshet is soon seized, and the fish may be caught in great numbers, but it is not sport.

As yet the Dominion Government has done nothing to protect this fish preserve of the Bow. People fish at all times, and the Indians use the net with a reckless regard to the consequences. Two or three sawmills will soon empty their refuse sawdust into the Bow waters, and the time is not far distant when the lower waters of the river will be depopulated of its trout, if not of all kinds of fish.

I have referred to a third variety of trout found in the Bow; it is so seldom caught that its existence in these waters is doubted by many. I have, however, seen a few specimens that have been caught. They weighed from eight to twelve ounces, and so closely resembled the brook trout of the East in shape, color and flavor that it is only an expert that could point out the difference.

This season will throw more light on their presence and habits in these waters, and in another paper I will endeavor to compile the results of the investigation.

Geo. B. Elliott.

Calgary, Alberta, N. W. T., July, 1885.

AN AWNING FOR FISHING BOATS.

Editor Forest and Stream:

I send you a description of a small awning which I use on my rowboat. I used the awning yesterday for the first time and found that it added so much to my comfort that I do not think any pleasure boat is complete without one. I was out on the river between 2 and 3 P. M., and although there was quite a breeze blowing up the river the heat was almost unbearable when exposed to the direct rays of the sun. I put up my awning, took off my coat and hat, and after wetting the top of my head with river water, I decided that I was feeling about as comfortable as was possible outside of an icehouse. I met and passed craft of all kinds, from the canvas canoe of nineteen inches beam, up to the rowboat of fifty, with the long ash oars and the long, lanky oarsmen, wearing straw hats with brims as large as a sulky wheel, and almost rivaling my awning; but then the hats rested on their heads and the sun beat down most unmercifully on top of those hats. The skipper hails me with "What's your time around the island now?" I answer "30.30, what's the best for your boats?" "30." "Is that the same old record made before the Fourth of July?" "Yes." We all smile and I pass on. They are going my way with two at the oars, but they exhibit a great desire to study the model of the stern of my boat. They always do.

Presently I pass an unpretentious fishing skiff built of three-quarter-inch white pine. The oarsman is perspiring freely, and the coxswain is almost roasted. The former ceases rowing, and the latter suddenly springs to his feet, removes coat and hat, and mounts the stern seat as though about to take a header. Wishing to see the performance, I back water with one oar, come round, and repass the boat. The coxswain having reconsidered the matter, has taken his seat. The oarsman asks, "Could you tell about how much it costs to occupy such a boat?" I answer, "About sixty dollars," and he remarks, "And it's well worth it." Presently I come to a lone fisherman with his boat drawn up on the bank as far as the strength of one man can draw it. He is sitting in the broiling sun just where I saw him six hours before. "Are they biting any?" "O, yes, I've got four eels." Passing around the lower point of the island, I head for the Bridgeport locks. Two or three small boys are in sight. "O, look a' there," and in thirty seconds a score of small boys swarmed on the towpath. The lock gates are open, and I run the gauntlet quickly. I do not remember all the comments I heard in the few brief seconds I was within earshot. They were mostly complimentary, but one remark which was intended to be otherwise I remember. Failing to give a prompt answer to the question, "What kind of a boat is that?" the next thing I heard was, "O say, he's a gitten ball-headed." This latter remark did not refer to the boat.

I started out to say something about the construction of the awning. It consists of four posts 1x1½ inch cedar, two parallel bars at the top, to which the covering of thin oilcloth is tacked, and a stretcher across the middle of the top of the awning, under the oilcloth. The parallel bars and stretcher are white pine ⅞x⅞. The parallel bars are four feet long, and when in position are parallel to the longitudinal line of the boat, and are fastened to the tops of the posts with one rivet at each end, forming a hinge joint, and allowing the posts to be folded up on the bars, after which the whole may be rolled up into a compact shape, the same as a map mounted on a roller. The stretcher is not permanently attached to the bars, but is sprung in from the under side after the other part is in position. It is held in place by means of a tenon one-fourth of an inch long, cut on each end. These tenons fit into notches cut into the top sides of the bars. They fit in between the oilcloth and the bottom of the notch, the shoulders formed on the ends of the stretcher butting against the bars, forcing them outward and thereby stretching the oilcloth. The lower ends of the four posts fit into four pockets, the depth of which correspond to the width of the gunwale minus the distance the gunwale overlaps the next strake below. They (the lower ends of the posts) are inserted between the gunwale and inwale, and rest upon the upper edge of the next strake.

I inclose a diagram showing the construction of the pockets. They are made of small strips of ash one-quarter of an inch thick and fastened to inside of gunwale with brass screws seven-eighths of an inch long. The length of the pockets front and aft is one and three-eighths inches, and the awning posts being only one inch wide, the awning may be set in a vertical position, or canted forward or backward, in such a position as to best protect from sun or rain. The top of the awning is eight inches wider than the boat, and its height is such as to just clear the head of the oarsman

when canted backward or forward to its fullest extent. In a very narrow or cranky boat it might be desirable to substitute some lighter material for the oilcloth, the latter, however, possesses the advantage of being waterproof. The advantages of this style of awning may be summed up as follows: The pockets take up no room in the boat, being flush with the inwale. They are inexpensive and any one can make them. The awning can be put up while underway, in one minute, by the oarsman, without leaving his seat. For lightness, strength, adjustability and simplicity, it is probably unexcelled.

The posts are riveted to the bars on opposite sides so as not to interfere with each other when folded up; the front posts folding outside, and the rear posts inside the bars.

Norristown, Pa., July 20. E. A. Leopold.

THE YOUGHIOGHENY.

YEARS ago the Youghiogheny River was filled with sunfish, chubs, catfish, suckers, etc. Somebody stocked it with black bass. All the former denizens of the stream have disappeared. Then several years ago some one took it into his head to stock an influent of the "Yough." with what were called salmon trout." Some one knows what they are I presume, but I've never found a man who does, a big-headed, black, ugly creature, scaleless, and whose flesh is rotten within an hour after you happen to catch him. I have caught them weighing two and a half pounds, they are not gamy, though said to be when planted. They are disappearing, eaten by the all devouring bass. Now what will become of the bass when this second supply of fish food is exhausted? Will they make a "Kilkenny cat fight" out of their present quarters, and leave the "Yough." destitute of fish? I presume so.

I heard a couple of young gentlemen, who were going trouting, a few days since, inquiring for a certain fish poison at a drug store. They got it, too. Now, did those young men intend trying to intoxicate the trout with this stuff? Or were they going to use it, as they told me, in the composition of what they deemed some "killing bait?" What is your opinion? For one I should not hesitate at all to prosecute any one detected in the unlawful taking of fish or game. If we have laws let us observe and enforce them.

Somerset, Pa., July, 1885. Amateur.

FLY-FISHING FOR PIKE-PERCH.

Editor Forest and Stream:

Last year I gave a description of a fly made by myself, consisting of orange body, with band of gold tinsel, scarlet ibis tail and wings of the yellow hair from the flank of the deer, with which I had been most successful in taking bass (small-mouths) in our Susquehanna, with an occasional pike-perch thrown in.

Mr. M. M. Backus, of 793 Broadway, when about to start on his annual trip last year to Lake Champlain, wrote me regarding the fly, and I sent him a sample from which he had some tied, but using the longer and mouse-colored hair instead of the deer's flank, which I have preferred. I did not get from him the promised report of its trial, and do not know if it proved successful in those waters.

What I wish to say to your readers now is, that I have recently had great sport with this fly with the pike-perch. In all I have taken 33 as follows: On July 20, 4; 22, 9; 24, 8, and 28, 12. These fish were all taken by moonlight, and just after the shades of evening had fallen. A fly thrown on the same water half an hour earlier failed to elicit a rise, and they were all taken in swift, shallow water, not over a foot in depth and just at the discharge of the waste water overflows from the canal feeder at the lock into the river, in a narrow channel not more than six feet wide. They were evidently cornered there in attempting to make a run up stream. In size they were small, ranging from one-quarter to one pound in weight; but the experience was peculiar and I give it to my brother chips in order, if any may be similarly situated, they may perhaps be rewarded on trial with like success.

The pike perch do not fight as gamely and give up sooner than the large or small-mouths. My experience with the two basses is like that of Mather and "Cyrtonyx," that larger fish of the open countenance will rise more readily to the cast fly, but I must give the palm for fight to the small-mouths. I have yet to see the former come out of the water as frequently on the same provocation and give the dog-like shake of the latter. A. F. Clapp.

Sunbury, Pa., Aug. 3.

IN KNOXVILLE WOODS.

[New York.—*Editor Forest and Stream:* The inclosed extract from a private letter, received from a Kentucky correspondent, exhibits plainly the magnetic effect produced upon an ordinarily staid and serious Methodist Episcopal dominie by a contest with the black bass. Should it be considered suitable for your columns, you are permitted to use it.—Geo. Shepard Page.]

THE 15th of April, 1885, a good Nimrod and Ike Waltonfriend, with the writer, might have been seen boarding the Knoxville express at Danville for objective point, Knoxville Woods, eighty miles deep in the mountains of Southeastern Kentucky, to the fishing headwaters of the Cumberland. Here, amid the splashing rapids of cool, clear water, we were to find where the game black bass jump beneath the overhanging hoary mountain cliffs, and hear the reel sing soft music and lightning trills as the bronze beauties spring to the spur of the steel, and lie at last softly rippling the water in the cool recesses of the fish box.

I only paint one among many scenes. A rocky promontory, an overhanging mountain cliff, broad shadows from leafy sentinels flung over a twirling eddy of water, singing lullaby at the base of a rushing rapid. After a 4 o'clock coffee at our camp our boat has glided softly three miles and as softly now swings to rope in anchorage in the eddy. Signs good—hist! there is a royal break from the pool; there goes the silk braid flying from the end of the bamboo, until the steel sprout strikes in the midst of the heaving ripple. Hark to ye! There is a gentle quiver to lax line as it steadily straightens into the whirling current. Click! comes the first overture from the reel. Sure as you live—the fun's up! Coming! Look ye! Out and out! Sing—whiz! Got it he has, and a-going! Strike? Not yet; not yet! And still he goes! Reel is now dancing. "O, Jemima, whar did ye come from?" Forty feet of line gone, and the time is Maud S. still! He is making for that huge boulder-lair in midstream, fifty yards wide. "Getting time to milk the cows"—sure. Gently the "brake." Hurrah, what a tether! Steady, my steel! Whack! we take him. Do your duty, bamboo! Hold fast, my sprout, for springing three feet into midair comes the five-pounder! Foam and splash! Double up, bamboo! Steady, my thumb! Whoop—did, did you see that? If he didn't make a jump to come down on the slack to break the hold! Nay, verily! Come home, old chap! And with dulcet strains of "Mary had a little lamb" a landing net is thrust out beneath the quivering side of the mountain brave, and the curtain falls to roaring music. And so our three or four days go, and when the soggy basket of beauties is chucked down on the veranda of Tucky Hoe the fish are still kicking beneath the lump of ice in the basket, and a first-class soiree from the waiting welcome of boys is now in order. "Sing low," Rangeley, and come down and strike hands with thy sister Cumberland, for "Columbia's the Gem of the Ocean!"

A SUMMER IDYL.

(Exhumed near the spot where, according to the "oldest inhabitant," a picnic of high solemnity was held in the year 1785).

O! WHAT is the arc that is traced above,
Approaching the stars and things?
'Tis the fugitive flight of the festive frog,
Which a muscular maiden swings.
And what is yon opalescent gleam,
That steals o'er the sunfish nest?
'Tis a gobbet of pork on a cotton line
That slowly sinketh to rest.
Whish—splash—
The fisher hath cast his line:
But his eye avoideth the float,
Because of the ribbons and calico gown
Of the girl that's in the boat.
Yank—cuss—
And the catty is in a tree,
An ill-conditioned and snaggy sprout
As ever you'd wish to see.
But it holdeth the catty and eke the line,
Forever, eternallee.
And the chowder fiend is abroad in the land,
And a potent sprite is he.
With pan and kettle he taketh his stand
Under the greenwood tree.
Rip—scrape—
He cleaneth the perch and dace,
Though his cuticle dreadeth the goading spines,
And the scales fly up in his face;
For he feareth the rush of the ravening crew
Which cometh to dine apace.
Wink—smile—
'Tis the bass in a shady hole,
And the politic pike with the open face,
At the flash of the whirling troll.
They watch the doodle-bug's steely tail
Catch fast in the mossy sticks,
And well remember the sort of folks
That commonly pic at nics.
Hum—buzz—
The 'skeeter is on the wing,
He watcheth a chance to light,
And ever he whetteth his vengeful sting
And seeketh a place to bite.
Yet playfully paddles the picnic crew,
Though the bass in his shadowy hole
Contemptuous winks at the skittering frog,
And the spin of the lively troll. K.

July 25, 1885.

SOUTHERN CALIFORNIA SEA FISHING.

ALTHOUGH I have been a reader of Forest and Stream for a number of years, I have never yet noticed anything in its columns concerning our sea fishing on the southern coast of our favored State; and, for fear Eastern readers will arrive at the conclusion that we have little or no fishing here, I venture to write this short note, hoping it may prove of interest to the readers of my favorite journal.

I believe that we have the finest deep-sea fishing in America, and I think I will be borne out in this by every reader of this who has ever trolled for barracouda, Spanish mackerel, or yellow-tails off the Heads outside the Bay of San Diego. As one of the guests of the Florence Hotel said the other day when invited to join a glass ball shoot (and he is a man who has fished from Florida to the Banks), "I can shoot glass balls any day, but I can't catch a barracouda every day, and I'm bound for the Coronadas in the Restless if I can't hold a line," and one look at his fingers would be enough to convince any one that, however much sport there might be in trolling for barracouda, there is plenty of hard work in it too; for each of the Judge's forefingers were wrapped in linen from the nail to the second joint, and an inquiry as to the reason would have elicited the reply that pulling from five to thirty pounds of a fish twenty yards against the momentum of a boat traveling at the rate of ten knots an hour was no joke.

It is no uncommon occurrence for a party to return with 300 fish at the end of a day's sport, and in the best of the season over 400 have been taken by three persons. The troll for catching barracouda consists of a large four-inch Kirby hook with a piece of bone or white rag attached to the shank, the line being about sixty feet long; from five to a dozen lines are cast adrift from the stern of the yacht as soon as the outside of the Kelp off Point Loma is reached.

The instant a school of barracouda or Spanish (or horse) mackerel is reached the fact is made apparent by the tightening of line after line as the fish take the troll, and the fun waxes fast and furious as fish after fish comes whirling over the gunwale of the boat; and sometimes for a steady hour the fish follow the boat, attracted by the bits of shiny bone flung to them by the anxious fishers, only to be hooked and flung ruthlessly down into the bottom of the boat, among dozens of companions. Once in a while, twang will go a line, and glancing astern one can see a white object glancing through the water like a flash, and the taut line shows that the fish is "making to windward." "Yellowtail" laconically says the skipper, and you grab the line frantically and haul in a few yards until Sir Yellowtail chooses to turn back, and you wonder how in thunder he can pull so hard. After a hard fight of perhaps ten minutes you lift a noble looking fish into the boat, and stoop over to examine him. You will see a fish weighing perhaps thirty pounds, and looking so nearly like a salmon that one will involuntarily exclaim, "It's a sea salmon," and a great many give it that name.

The barracouda season lasts from about March 15 to June or July of each year. Thousands are caught here and dried and shipped to 'Frisco annually, although there is no regular fishery established here.

Besides the trolling outside, one can tie up to a "bull kelp," and lowering his line to bottom, about six fathoms, can catch a hundred pounds of sea bass, redfish, groupers, rock cod, kelp fish, and a half dozen more varieties of deep-water fish, in a couple of hours; or, not liking to go so far, particularly if one's digestive organs can't stand "old father ocean," he can adjourn to the steamship wharf in the bay, and, seated pleasantly in the shade with a light rod and proper tackle, he can land in an hour's time, twenty or thirty fine gamy mackerel, ranging from nine to fifteen inches in length, or going to bottom, with a species of crawfish for bait, he can catch the same number of "croakers," sea bass or rock cod.

If he is a "thoroughbred" and a "stayer," let him provide a good joint rod, about fifty yards of hand braided line (large size), a good reel, some A1 Limerick hooks; get everything properly "fixed;" attach a live smelt about five inches long on his hook by running the barb of the hook through the skin on the back of the fish, make a cast with the tide, and walk slowly back and forth along the wharf. The wharf runs southwest and the tide coming in or going out runs northeast or southwest. This plays his line out about thirty feet. If the day is propitious he will land from three to six halibut in the course of an afternoon, averaging about ten pounds in weight. I saw one caught on the wharf one day last summer by a boy and landed with a gaff, which weighed thirty-five pounds, and which was sold for $3.50 on the spot.

By changing the size of the hook to a lesser number, one can have glorious sport trolling for bluefish from the wharf, and I have counted sixty-three lines trolling in a space of a hundred yards. By casting a large line and hook out from the end of the wharf with a dead fish for bait, one can catch sharks ranging from three to six feet in length, and which will furnish a man all the fun he wants.

We have two seaside resorts, one the Mussel Beds, distant eight miles by land, and La Jolla (pronounce La Hoya) twelve miles distant, both popular drives where visitors can gather unlimited quantities of beautiful mosses or sea shells, or the far-famed Abalone shells, from which so much jewelry is made, and where thousands are gathered annually, the meat dried by Chinamen, shipped to San Francisco, and there sold to restaurants and hotels to furnish clam chowder for thousands. The shells are ground down, polished and sold as curios, or cut up and made into jewelry, etc. Probably no shell in the world has as many uses or is as much admired as the Abalone.

The fishing at both Mussel Beds and La Jolla is fine. Seated on the rocks, which are perpendicular in some places for twenty feet to the water, with a good braided line, large clams for bait, one can catch on a flood tide a dozen fine rock bass or rock cod, redfish or sea bass, averaging from five to seven pounds in weight, and do it without wetting his feet or clothes, or should he desire larger game, let him bring a hundred yards of heavy line, a six-inch hook, and baiting it with a piece of beef cast from the rocks out into deep water, the chances are good that before an hour passes either he is "out" a line or he is "in" a shark. Some monsters have been seen here, and bathers are very careful not to go too far out, although no one has as yet been injured by them.

If any reader of this comes out this way, let him call on the writer, and I will endeavor to show him some of the finest sport in the world on this bay and in its vicinity in that line. As the hunting season is now over, and we are compelled to lay down our guns until the first of October, we make up for it by handling rod and reel on every occasion we can, and some royal times we've had in the last month outside the heads, at Mussel beds and at La Jolla.

San Diego, Cal. Ad. B. Pearson.

THE BIG TROUT SECRET.

TWENTY-EIGHT years ago, some fishermen living on the south shore of Lake Ontario, in the State of New York, set some trap nets in Salmon River, and in one of them caught a salmon which weighed just sixty pounds. My wife cleaned, stuffed and baked it in an old-fashioned brick oven, and a party of twenty men and women sat down to the feast. I don't know how much a salmon ought to weigh, but it seems to me that it must have been a big one at all events.

Reading in your paper about bait-fishing for speckled trout, recalls to my mind some exploits in that line of old Phineas T. Goodrich, formerly Prothonotary of Wayne county, Pa., and his crony, Lysander S. Hill, a jeweler and an inveterate fisherman. The pair frequently started out before daylight in the morning on foot, and by break of day would be miles away among the mountain forests, where the brooks tumbled their coldest waters over the rocky bottoms. They usually were absent two or three days, and just where they fished was known to no one but themselves. In vain were all queries on that point; the answers were always evasive—that is, nearly always! What caused so much inquiry on that particular point was the fact that the pair always returned carrying strings of trout phenomenally large—the altogether largest speckled trout ever seen, and they were handsome, too, I tell you! No other sportsmen could find the stream where such monsters were caught. The brooks, lakes and rivers of Wayne and Pike counties were all ransacked in vain. Goodrich and Hill remained the champions on big trout. All this was years ago. A few years since I met Mr. Hill in a Western city whither he had removed, and in calling up reminiscences of the past I one day asked him where it was that he and Goodrich used to catch them big trout. He was sandpapering the butt of a fish pole he was making at the time. He looked at me for a moment with a sly look in his eyes, then laughed.

"Come, now," said I, "where was it?"

"Do you really want to know—bad?" said he.

"Yes; out with it," said I.

"Well, then, I'll tell if you must know; we caught them in all the good trout streams," said he.

"How?" asked I.

"It was all in the bait," said Hill.

"In the bait!" echoed I.

"Yes; it was a dead secret between us. We used minnows and dropped to the bottom of the still, deep pools; there's where the big fellows lie, and they would go for that minnow like chain lightning. Christopher! but they were ugly to handle."

"Shake!" said I, and we shook.

The secret of years was out. Try it.

Bah! I am disgusted. After writing the above, and calculating to produce a Waltonian sensation, upon reading the same to my wife to assure her that it was not a letter to the other girl she exclaimed:

"Pshaw! They always used minnows when fishing for speckled trout up by the Salmon River Falls, and the littler they were the better. I've used 'em no more'n an inch long, and they were the best."

Such is life. Common Sense.

CANADA SALMON.—Montreal, July 30.—It has not come to pass in many years that salmon has been a drug on the market here, but this season, owing to the splendid catches which have taken place on the Lower St. Lawrence, the poorer classes have been able to luxuriate on salmon at prices more moderate than they are accustomed to pay their butcher. The trout season, which is now at its height, is almost unprecedented for the number and size of fish taken. The Restigouche and the Cascapedia has been thronged ever since the season opened by many distinguished American anglers, including ex-President Arthur, Dean Sage, of Albany; Mr. Lawrence, of New York; Dr. J. H. Baxter, Chief Medical Surveyor United States Army; General Henry DeForrest, Collis Johnson, John DeMott, W. K. Soutter, Albert Bigelow, and H. P. Wells, the angling author, and a large number of the members of the St. Marguerite Salmon Club, New York. Ex-President Arthur is reported to have killed more fish in a given time than any other rod this year, his take within a week amounting to ninety-eight salmon, averaging twenty-four pounds each. Since the Princess Louise had such good sport in these waters it has become quite fashionable for ladies to whip the streams, and Lady Lansdowne, prior to her visit to England, succeeded in hooking and killing some of the finest fish taken during the season. Sir Roderick Cameron, of New York, who has been fishing the Restigouche with one of the Judges of the Supreme Court of the Dominion, has also enjoyed excellent sport. He was, however, found guilty of violating the fishery regulations by killing salmon on Sunday and was fined $10. The Supreme Court Judge luckily got off by a technicality, being equally guilty of fishing on Sunday, but not of killing his fish. Frequenters of the realms of the trout and salmon know that this violation of the law is indulged in regularly by people who, while under home influences, are more pretentious, if insincere, in their observance of the day of rest, and that the army of fish is not even allowed to enjoy one day out of the seven. It is hinted by a local journal here that a nobleman occupying an exalted position in the Government of the country sets this bad example, and that the magnates and millionaires of wealthy railway corporations follow in his footsteps. The same journal aptly remarks that it is these nabobs, who go to the salmon waters armed with rods, flies, gaffs and well-stocked hampers, who are the breakers of the laws which they wish enforced against the poor Indian, who knows no law of game preservation.—*Correspondence New York Evening Post.*

BROWN TROUT.—"About two and one-half years ago," says the Rochester *Democrat*, "the State fish hatcheries at Mumford imported from Germany a quantity of the eggs of the German trout, a fish greatly resembling the English brown trout. This trout is a winter spawning fish and so could be crossed with the native brook trout, and it was for this purpose that the eggs were imported. Thursday, F. J. Amsden, of Rochester, was casting the fly in the stream at Mumford, below the ponds, and captured a beautiful specimen of the German trout. It was taken with a No. 16 hook and was landed after a struggle of fifteen minutes. Although but two and a half years old, the trout weighed fourteen ounces. It has small scales which are perfectly discernible and is thickly covered with bright vermillion spots. As the German trout is such a rapid grower, the cross with the native fish will undoubtedly give a more desirable fish." The *Democrat* is in error so far as to the importation of the eggs of the "brown trout" of Europe is concerned. They were not imported for crossing, nor were they imported by the hatchery at Mumford. The eggs were sent by Herr von Behr, president of the German Fishery Association, and Herr. von dem Borne, the well-known fishculturist, as a personal present to Mr. Fred Mather, superintendent of the New York Fish Commission, at Cold Spring Harbor, and he presented a few to the Mumford hatchery. Mr. Mather is firm in the belief that this fish will prove of great value in our waters if it can be successfully acclimatized. If they have any of these brown trout at Mumford they will do well to get a pure breed established before they begin to degrade either the brown trout or our native fish by hybridizing, for in this process what is gained on one side is lost on the other. If the progeny of two species is superior in any respect to one parent it is certain to fall below the other in some other point, or to prove infertile.

TROUT SLAUGHTER.—Philadelphia, Aug. 1.—Information comes from Kane, Pa., that a great many trout are being killed in the streams of Elk, McKean and Cameron counties by dynamite. The work of the fish butcher is not confined to one county, but extends all over the lumber regions of the northwestern part of the State. They have operated on Johnson's Run, Bear Creek, Spring Creek and Mill Creek, in Elk county; West Clarion Creek, Straight Creek and Johnson's Creek, in McKean county; along the Sinnemahoning and Driftwood, in Cameron county, and on the small streams of Clearfield and Clinton counties. When the Jersey Shore & Pine Creek Railroad was being built the workmen openly used dynamite, and many large trout were secured in this illegal manner. Now it is impossible to catch any but fingerlings there when formerly it was an easy matter to fill a creel with one quarter to one-half pound fish. The penalty for fishing with this explosive is $50 fine and costs, and in default of payment, imprisonment at the rate of one day for each dollar of fine and costs. The legitimate fishermen of Kane and vicinity, we are glad to learn, have determined to see that the law is enforced, but find it a difficult matter to push, as the law-breakers are shielded by their friends. It would be well if the Fish Commissioners of this State would act in the matter.—HOMO.

WEAKFISH AT BARNEGAT.—Philadelphia, Aug. 1.—The weakfish have not been biting well this week at Barnegat or Tuckerton bays, notwithstanding it is stated there is this season more shrimp in these waters than for years past. The baymen attribute it to the hot weather which has likewise reached the coast. There is every indication, however, of there being plenty of fish in the bays, but they appear to be sluggish in taking hold.—HOMO.

IT DOES NOT PAY.—George Smith, of Lake Village, who threw a dynamite cartridge into the lake at Weirs a few days ago, killing an immense number of fish, was arrested by Fish Commissioner Hodge, of Plymouth, Tuesday, pleaded guilty, and was fined $50 and costs. George will now explode almost as bad as the cartridge did whenever any one says dynamite to him.

BASS IN CHENANGO.—Bass-fishing is reported to be good in the vicinity of Green, Chenango county, N. Y.

A BIG LAKE TROUT.—The Manchester, N. H., *Mirror and American*, of July 29, records the capture of a lake trout, (*S. namaycush*) which weighed twenty-eight and a half pounds, near Laconia, N. H., as follows: An extraordinary event took place on Lake Winnisquam, near this village, Monday, which eclipses anything in the piscatorial line ever heard of in this section. A party of gentlemen went "across the bay" and landed upon the Sanbornton shore for a fish prize. Five of the party subsequently took a small boat and took a position a short distance from shore, to catch perch. There was but one "trout gear" among the party, which Will J. Busiel utilized, and in about half an hour landed an 11½-pound trout. At this another of the party, William Belford, remarked, "I'm going to catch one that will lay you all out," and proceeded to hunt up a "tackle." It appears that there happened to be a large ball of twine in the boat, near the size of a pipe stem. Belford got hold of this and also an old rusty cod hook. These he "bent" together and attaching a "cold chisel" for a sinker, put on a good sized bull frog for bait and cast off. The eccentric paraphernalia went to the bottom, as a matter of course, very suddenly, where it lay for about five minutes, when there was a bite. Business on the boat began to be lively soon after and intense excitement prevailed. The huge trout, (for such it proved to be) was boarded in about twenty minutes, not before all hands however rendered assistance in taking him in. The trout in coming to the surface broke water some twenty feet from the boat, where he "skived" about in all directions with great energy. Getting nearer to the boat, one of the party, Jonas McGuire, dealt a powerful blow with a piece of board, which cut a gash two inches deep in the trout's back, which sort of numbed him, when John Gordon inserted his fingers into the gills, and hoisted him into the boat. Belford was "pale as a ghost" at the conclusion of the operation, and, although a powerful man, came near fainting away under the excitement. The singular part of the affair seems to lie in the fact that such a hastily improvised and uncouth rig should capture the prize trout ever landed from the waters of any lake in this section, including Winnipesaukee. The weight was twenty-eight and one-half pounds, the head alone weighing four and a quarter pounds, and the extreme length being forty inches. Mr. Belford has been the recipient of many congratulations since the event, and when approached upon the subject to make a statement, warms up to the situation almost as much as though he had another bite. Mr. Belford is proprietor of the Belknap Shoddy Mill, and a well-known devotee of the rod and gun.

DEATH OF UNCLE FRANK O'DONNEL.—Francis B. O'Donnel, an old-time fisherman and politician, died at his residence, 138 Lexington avenue, yesterday afternoon. He was born in Ireland in 1812. He came to New York with his parents when only 2 years old. When a young man he had a tenor voice of remarkable power and sweetness, and for fifty years he sang "The American Boy," at all the Tamany Fourth of July celebrations. He retained his voice to the day of his death. For a quarter of a century he was an officer of the Court of General Sessions. He was afterward an attaché of the Mayor's office. Of late years he had not been in public life. Much of his time was spent in fishing from the docks, Split Rock at Manhattanville, Staten Island, the Newark draw and other places. He was probably the oldest fisherman in New York city. He caught drumfish off the Hook on the East River forty years ago. Old John Deunet, Billy Baird, Aleck Murray and Amos Cummings were his favorite companians. Mr. O'Donnel died from aneurism of the heart. He was familiarly known as "The Captain." He leaves a widow, three sons and a daughter. A more genial, warm-hearted man, and a more patient fisherman never breathed. The Tammany Society passed resolutions of regret last night.—*New York Sun, Aug. 3.*

SALMON ANGLING IN MAINE.—The Belfast, Me., *Republican Journal* says: "Salmon have not been so abundant in the Penobscot for fifty years, and over forty of these royal fish have been taken at Bangor. Fish Commissioners Stillwell and Stanley indulged in an hour's angling with the rod and fly there, Thursday, Mr. Stillwell succeeding in capturing one fish and Mr. Stanley hooking two, but losing them both. Statements had been made that the fishway on the dam was not effective, but the commissioners proved the utility of the way by closing it and examining the interior. They found several salmon therein, one being at the head and about to enter the water above. The Penobscot salmon are now characterized by their medium and small size, which is evidence to the commissioners that they are the same fish with which the river was previously stocked. Mr. L. A. Dow, Brigadier's Island, Searsport, so far as we can learn, was the champion salmon catcher in this vicinity for the season just ended. He caught 507 salmon, averaging thirteen pounds each—a total of 6,591 pounds. It was a profitable season's work for him."

HOW TO CATCH CRAYFISH.—Memphis, July 29.—In reply to "W. L. A." the method pursued by the dagoes and negroes in lower Louisiana is novel as well as interesting. Great quantities of these crustacea are captured in that region for the New Orleans market, where they are highly esteemed for making "gumbo," a very toothsome dish when prepared by a creole cook. The modus operandi of the capturing is simple enough, as I have frequently seen it practiced. A piece of cord a couple of feet in length is tied at one end to the middle of a light stick about a foot long. To the other end of the cord is securely tied a small bit of meat, usually fat bacon. Each artist manipulates an indefinite number of these machines, perhaps two dozen. He (or she) tosses them out into the muddy ponds or "borrow pits," near the levees. Then the operator, with breaches rolled up or petticoats elevated, wades gently through the pond with a pail or basket in one hand, and visiting each line in turn, slowly raises it out of the water and drops the catch into the receptacle provided.—COAHOMA.

SAN BUENAVENTURA, Cal.—The trouting season is about closed here now. Great numbers of trout have been caught in the Ventura and other streams in this vicinity. A friend and the writer caught 115 one day last week, but many of them were fingerlings that we threw back. The largest were from eight to fifteen inches in length. A salmon trout twenty-one inches long was caught near here some time ago. —TYPO.

A LIBERAL REWARD WILL BE PAID FOR INFORMATION that will lead to the discovery of an angler who is not "a true disciple of Old Izaak," who does not go to bed "to dream of the glorious sport on the morrow," who does not "entice with his lure the finny denizens of the stream," and who does not catch "speckled beauties." I am such an one myself, but I am awfully lonely. Address SILAS SYLVAN, care FOREST AND STREAM. aug6,1t

BLACK BASS IN LAKE CHAMPLAIN.—St. Albans Bay, Vt., July 28.—*Editor Forest and Stream:* The fishing is not at its best here yet, although there are fish enough to satisfy any reasonable man. I met your correspondent, Mr A. N. Cheney, and his friend Major Butts here. Mr. Cheney went out last Saturday and took 8 bass weighing in the aggregate 19½ pounds. On Monday he took 16 bass which weighed 23½ pounds, and he reports them as very gamy. There are half a dozen anglers here but none come up to Mr. Cheney's record, and he is continually applied to for lessons in the art. In his genial way he tells them that he simply fishes when the fish are hungry and they do not; but we don't believe that to be the only reason. He is known as an expert and it is impossible for him to impart all that he has learned in many years in the course of conversation. I hope to try the fish to-morrow and will report.—THE THIRSTY PELICAN.

A SEVENTY-POUND BASS.—An enormous striped bass, caught off Noman's Land (south of Martha's Vineyard), was on exhibition in Boston last week. It weighed 70 pounds, and is said to be the largest of its species ever caught with line and reel alone.

MOSQUITOES KILL TROUT.

THE following letter to the U. S. Commissioner of Fish and Fisheries opens up a new question concerning the mortality among young trout. We have never heard of such a case, and commend it to the attention of fishculturists. It is not unusual to see fry with a large umbilicus at the surface for a few seconds while in the hatching troughs, but it is rare to see them rise thus in streams, where they are not so crowded and disturbed by their fellows:

Prof. Spencer F. Baird, Washington, D. C.:

DEAR SIR—It may be of interest to you and of some importance to science if I detail some facts that I was witness to in regard to the destruction of young mountain trout by mosquitoes. In the middle or latter part of June—I think it was—in 1882 I was prospecting on the headwaters of the Tumichie Creek, in the Gunnison Valley, Col. About 9 o'clock in the morning I sat down in the shade of some willows that skirted a clear but shallow place in the creek. In a quiet part of the water where their movements were readily discernible were some fresh hatched brook or mountain trout, and circling about over the water was a small swarm of mosquitoes. The trout were very young, still having the pellucid sack puffing out from the region of the gills, with the rest of their body almost transparent when they would swim into a portion of the water that was lighted up by direct sunshine. Every few minutes these baby trout—for what purpose I do not know unless to get the benefit or more air—would come to the surface of the water so that the top of their head was level with the surface of the water. When this was the case a mosquito would light down and immediately transfix the trout by inserting his proboscis or bill into the brain of the fish, which seemed incapable of escaping. The mosquito would hold his victim steady until he had extracted all the life juices, and when this was accomplished he would fly away, the dead trout would turn over on his back and float down stream. I was so interested in this before unheard of destruction of fish that I watched the depredations of these mosquitoes for more than a half hour; and in that time over twenty trout were sucked dry and their lifeless shells sent floating away with the current. It was the only occasion that I was ever witness to the fact, and I have been unable by inquiry to ascertain if others have observed a similar destruction of fish. I am sure the fish were trout, as the locality was quite near snow line and the water very cold, and no other fish were in the stream at that altitude. From this observation I am satisfied that great numbers of trout, and perhaps infant fish of others varieties in clear waters, must come to their death in this way, and if the fact has not been heretofore recorded it is important to those interested in pisciculture.

I remain, very respectfully yours, C. H. MURRAY.

DENVER, Col., July 23.

MASSACHUSETTS LOBSTER LAW.—Public Statutes, Chapter 91: SEC. 81. Whoever during the month of July in any year catches or takes from any of the waters of this Commonwealth any female lobster bearing eggs, shall be punished for each offence by a fine of not less than ten nor more than one hundred dollars, or by imprisonment in the house of correction for not less than one nor more than three months; but a person catching or taking any such lobster during said month of July, and immediately returning it alive to the waters from which it was taken, shall not be subject to such penalty. [As amended in 1882, chap. 98.] SEC. 82. Whoever during the month of July in any year sells or has in his possession with intent to sell, any female lobster bearing eggs, taken in this Commonwealth, shall forfeit for each offence a sum not less than ten nor more than fifty dollars. [As amended in 1882, chap. 98]. SEC. 83. The mayor and aldermen of every city, the selectmen of every town, and all police officers and constables shall cause the provisions of the two preceding sections to be enforced in their respective cities and towns. Acts of 1884, Chapter 212. SEC. 1. Section eighty-four of chapter ninety-one of the Public Statutes is amended so as to read as follows: Whoever sells or offers for sale, or has in his possession, a lobster less than ten and one half inches in length, measuring from one extreme of the body extended to the other, exclusive of claws or feelers, shall forfeit five dollars for every such lobster; and in all prosecutions under this section the possession of any lobster not of the required length shall be *prima facie* evidence to convict. SEC. 2. Any mutilation of a lobster affecting its measurement shall be *prima facie* evidence that the lobster is less than ten and one half inches in length. SEC. 3. The commissioners of inland fisheries shall have the same powers to enforce the provisions of this act as they have to enforce all laws regulating inland fisheries given them by section three of chapter ninety-one of the Public Statutes. SEC. 4. The governor may, at the written request of the commissioners of inland fisheries, or either of them, detail one or more of the district police, from any district or town he may see fit, to enforce the provisions of this act throughout the Commonwealth. Acts of 1885, Chapter 256: SEC. 1. For the purpose of enforcing the provisions of chapter two hundred and twelve of the acts of the year eighteen hundred and eighty-four, relative to the protection of lobsters, either of the commissioners on inland fisheries, personally or by deupty, or any member of the district police detailed by the governor as provided in said chapter, may search in suspected places for, seize and remove, lobsters taken, held or offered for sale in violation of the provisions of said chapter.

FISHCULTURE IN MAINE.—Three hundred thousand young salmon have been placed in the head waters of the Penobscot River; 200,000, of the Kennebec; 200,000, Saco; 40,000, Denny's. One hundred thousand land-locked salmon were liberated in Moosehead Lake, and 50,000 in Rangeley Lakes. Black bass are now very thoroughly distributed throughout the State, and but little more effort will be required in the way of increasing the numbers of these fish.

FISH FUNGUS.—Wilmington, Del., Aug. 4.—Thousands of dead fish are found floating in the streams about this place. They are attacked by the parasitic fungus called by scientists saprolegnia. They attack the fish, propagating on them and killing them by thousands. The saprolegnia are colorless parasites found attached to animal or vegetable organisms in water. They are found more especially on dead insects, frequently forming dense radiating tufts. They arise originally from decomposing matter, especially animal organism. They throw off spores in great quantities, and these are carried about in the currents and attach themselves to the fish, where they germinate and send off more spores. They eat into the fish, absorbing the animal matter of its body.

FIXTURES.

BENCH SHOWS.

Sept. 22, 23, 24 and 25.—Dog Show of the Milwaukee Exposition Association. John D. Olcott, Superintendent, Milwaukee, Wis.

Sept. 29, 30 and Oct. 1, 2.—Third Annual Dog Show of the Southern Ohio Fair Association. H. Anderson, Secretary, Dayton, O.

Oct. 5, 6 and 7.—Second Annual Dog Show of the Philadelphia Kennel Club, in conjunction with the Pennsylvania State Agricultural Society. E. Comfort, Secretary, Philadelphia, Pa.

Oct. 6, 7, 8 and 9.—Fourth Annual Dog Show of the Danbury Agricultural Society. E. S. Hawley, Secretary, Danbury, Conn.

Oct. 27, 28 and 29.—Twelfth Dog Show of the Western Pennsylvania Poultry Society, Pittsburgh, Pa. C. B. Elben, Secretary.

FIELD TRIALS.

Nov 9.—Second Annual Field Trials of the Fisher's Island Club, for members only. Max Wenzel, Secretary, Hoboken, N. J.

Nov. 9.—First Annual Trials of the Western Field Trials Association, at Abilene, Kan. Entries close Oct. 15. A. A. Whipple, Secretary, Kansas City, Mo.

Nov. 16, 1885.—Seventh Annual Field Trials of the Eastern Field Trials Club, High Point, N. C. Entries for Derby close May 1. W. A. Coster, Secretary, Flatbush, L. I.

Dec. 7.—Seventh Annual Field Trials of the National Field Trials Club, Grand Junction, Tenn. Entries for Derby close April 1. B. M. Stephenson, La Grange, Tenn., Secretary.

A. K. R.—SPECIAL NOTICE.

THE AMERICAN KENNEL REGISTER, for the registration of pedigrees, etc. (with prize lists of all shows and trials), is published every month. Entries close on the 1st. Should be in early. Entry blanks sent on receipt of stamped and addressed envelope. Registration fee (50 cents) must accompany each entry. No entries inserted unless paid in advance. Yearly subscription $1.50. Address "American Kennel Register," P. O. Box 2832, New York. Number of entries already printed **2519.**

"WILDFOWLER'S" THIEVERY.

Editor Forest and Stream:

"Wildfowler's" communication in FOREST AND STREAM of July 23 is absolutely false in every particular, and written for no other purpose than that of misleading your readers. When he tells you that I wrote him a friendly letter a fortnight ago asking him if he could supply me with a bitch, he simply writes that which he knows is false, and I challenge him to produce the letter. He cannot do this. I know he cannot do it, because I have not written him any such letter. Furthermore, if I wrote him a "friendly" letter within the past three months, then indeed I am totally incapable of expressing my indignation. What I said about the bitch is this. Clement wrote me saying he had a "very nice bitch, and would let me have her for £25." After telling him how I was put about in the way he had treated me in the dog transaction, I said: "In regard to the bitch you offer, I will be candid with you and say to you as I said to your friend in Chicago a few days ago, *i. e.*, I would be afraid to send you any more money, for fear that I should never hear from it again." If Clement can construe this into a "friendly" letter, he is welcome to do so.

Again he tells you that he holds scores of letters in which I told him I was in no hurry. I call for the proof. In my first letter to him I told him I was in no particular hurry. By that I did not mean that I was willing to wait months or years for what I wanted, and no man with the semblance of honesty about him would construe in that way, and in his answer he led me to believe he had the dog in his possession and could send it at once, saying, "He is a wonder and I should like for you to have this one."

Then he tells you that Mr. Mason is at the bottom of the trouble. This I most emphatically deny, masmuch as Mr. Mason did not even know of my having sent to Clement for a dog until after I had given Mr. McKinley an order on Clement for the money and had fully determined to expose the whole steal; and in doing this I required no assistance. I only wish that Mr. Mason had known of my intentions of sending money to the thieving scoundrel. I am confident that I would be about £40 better off now. I will now prove to your entire satisfaction that C. did not pay carriage on this dog as he agreed to do:

LONDON, March 24, '85.—*Mr. H. Muss:* Sir—We beg to advise you that one dog for you, received from Mr. L. Clement, is this day shipped to care of R. F. Downing & Co., shipping agents, New York, to whom please give early instructions as to forwarding and claiming same, and to whom please pay our charges, which are as follows: Carriage and charges London to New York, £9. Yours truly, SUTTON & Co.

It will be seen from the above letter that he was trying to get back the £5 which he had paid to Mr. McKinley and make me pay carriage besides. I ask you, Mr. Editor, and readers of FOREST AND STREAM, is this not a thieving transaction? That he did not, at first, pay the importation duty I will also prove, and by not having done that the dog was kept at the bonded stables until a certificate could be got, and for which he blames the consulate. Let us see about this:

LONDON, May 4, 1885.—*H. Muss:* Dear Sir—I regret there should have been any delay about the delivery of the dog, but my "man" was told that no certificate was necessary, and so he did not take any. I have sent for one to-day, and will forward it to agents, who will see about putting matters straight.—L. CLEMENT.

The above letter will prove to you that the importation duty was not paid by Clement, and the dog was kept at the bonded stables where additional charges accrued, until a certificate could be had. Now, I ask you again, must I pay these charges, $74.75, in addition to the amount already paid by me? But he tells you Mr. Mason is to blame for the whole trouble. This is indeed laughable. If Clement had told us that the Chicago editor was to blame for the whole trouble, he would have come nearer telling the truth, for it was he who advised would-be importers to send their money to Clement. Now let us see what he said he could and would send me for £40, after which we will take a look at what he actually did send.

LONDON, March 19, 1884.—*H. Muss;* Dear Sir—I could send you a tip top black and tan terrier, fit to win all over the world, for £40, and it would be of A1 pedigree, young, well-marked, whip-tailed, strong-loined, good-headed, and altogether first-rate.—L. CLEMENT.

The dog he sent out weighs over thirty pounds, has very heavy shoulders, poor head, light eyes, and his mouth is not level, besides which he is entirely destitute of all terrier character. The price I paid for this dog is high, and I should have had a typical specimen. Has he fulfilled his bargain "to the letter?" I have shown conclusively, I think, that he has in no way fulfilled our bargain. I now rest my case with the jury—the readers of the FOREST AND STREAM—and will await their verdict.

In conclusion let me say that I received a letter from Clement a few days ago in which he appears to be very angry because I had seen fit to expose the steal. He has only himself to blame for the exposure, since I gave him due and timely notice of what I intended to do unless he made matters right at once, without any further delay or expense to me, and to all of which I only received an evasive answer.

HENRY MUSS.

CHAMPAIGN, Ill., July 27, 1885.

Editor Forest and Stream:

In reply to Clement ("Wildfowler") I wish to state that the Mr. Mason mentioned by him is an entire stranger to me, and had nothing to do with me or my dealings with Clement. Is it not enough for Clement to swindle me out of $100, without trying to draw in an innocent party, such as Mr. Mason?

CHAS. F. KENT.

MONTICELLO, N. Y.

Editor Forest and Stream:

The fact of Messrs. Kent and Muss having sent money to L. Clement, alias "Wildfowler" is in itself conclusive proof that they never consulted my opinion. I know Clement.

C. H. MASON.

NEW YORK, Aug. 3.

Another of "Wildfowler's" trans-Atlantic swindles is given as follows in the *Sporting Life:*

Editor Sporting Life: As you are showing up the swindler "Wildfowler," and I have come across a case which it will be impossible for him to explain, even in the transparent manner he has attempted to brush aside the Kent and Muss cases, I think it best to forward the documents. The person swindled in this case was my friend Cummings, of South Acworth, N. H., and the amount he was done out of was £19. You will observe that Mr. Cummings had no difficulty in getting letters till he sent the money, which was never acknowledged. I suppose the receipt went astray like the others. The first mention about the money, which was sent in April, 1884, is in the letter of May 18, 1885, telling Mr. Cummings to draw on him for the money. This Mr. Cummings did, but instead of getting the money he only received the dishonored draft.

The particulars of the case not shown in the correspondence are as follows: Before sending the money to "Wildfowler," Mr. Cummings made inquiries of the editor of one of our sportsmen's papers and was advised that Clement was perfectly reliable, and thereupon sent him £19 to pay for a spaniel bitch bred to Obo and landed in New York. You will notice Clement says in his letter of Feb. 19 that he has a bitch and will ship her the following Saturday. Now if he had a bitch on that date and she was to be shipped on the Saturday, she must have been at Ipswich to be bred to Obo or else Clement lied. If any one cares about asking Mr. Farrow, the owner of Obo, he will find that Clement did not breed a bitch to his dog at all. In Clement's next letter no mention is made of this bitch, so it is evident that the lie was told so as to put off Mr. Cummings in view of the recent exposures.

As "Wildfowler," in his letter which appeared in FOREST AND STREAM this week, gives Mr. Mason all the credit for bringing his Kent and Muss swindles to the notice of American dog buyers, I send this communication to you over my own signature to show the *Shooting Times* editor that there is but one feeling over here with regard to his way of dealing, and that is thorough exposure of his thievery.

Yours respectfully, GEO. W. LEAVITT.

BOSTON, July 24.

The letters received from Mr. Leavitt cover a period of eighteen months. In the free "ad" "Wildfowler" has in the —— —— in return for his services as English correspondent of the official organ of the International Cocker Club, he offers cockers at six guineas. Mr. Cummings sent a letter of inquiry respecting spaniels and received the following reply:

LONDON, Dec. 29, 1883.—Dear Sir—I can get you the black slut you want for ten guineas and get her lined by Obo, and I would have her declared for breeding and pay her freight to a United States seaport all for eighteen guineas, so that you would have no trouble in the matter. The cockers at six guineas are liver and white. The black ones are much scarcer as doubtless you know.—L. CLEMENT, W. P.

The following is an extract from the next letter of Jan. 26, 1884:

* * * You have given me your instructions, I therefore know exactly what you want. Send along your remittance and I will send you a bitch to fill your bill either from my own kennel or from some other breeder's kennel. I know perfectly well what you ought to have, and I will take care that you get it. The price is ninety-four dollars. I could not do it for less considering all I have to disburse. * * * —L. CLEMENT, W. P.

The next letter is written by the man who still holds the money:

FEB. 10, 1884—Dear Sir—I have written to the man about bitch, but have had no reply, so I conclude she is sold. Besides one cannot get a good-looking bitch for that price. I think you had better do as I suggested in my former letter.—L. CLEMENT.

A month later Wolf Polkingham signs L. Clement without adding his own initials, to the following letter:

MARCH 8, 1884.—Dear Sir—Have you sent the check for eighteen guineas? If so, I have not received it. I have three spaniel bitches offered me, and one will suit you occasionally.—L. CLEMENT.

This is an extract from the next letter, signed as the foregoing:

MARCH 22, 1884.—Dear Sir—I have put myself into communication with the leading kennels, so as soon as I receive your check I will get half a dozen bitches sent me to choose from. You may rely on getting a good one. * * * I should advise you not to delay longer than you can help.—L. CLEMENT.

The letter which follows was doubtless written before the draft sent in April was received by the firm of "Tiger" Clement & "Wolf" Polkingham. The proposition reminds one of the heads-I-win-tails-you-lose proposition of our youthful days:

MAY 5, 1884.—Dear Sir—I have had several good pedigree black bitches offered me, but they are over the weight you require. Then there is another one, very handsome and under twenty-three pounds, which would do, but the owner can only give the sire's name. The dam's name he does not know, but he can give the name of the kennel she hails from. Now which would you rather have. One of the heavy pedigree ones or the last one? As soon as I hear from you I will secure the one you prefer and will arrange about the service of Farrow's dog.—L. CLEMENT.

About this time the cash which "Wildfowler" had so industriously been angling for arrived, and it was then a case of "Good-bye John," and the next letter we have is six months later and the old Kent and Muss stories are repeated of plenty of dogs before the money was sent and then a remarkable shrinkage in the hitherto abundant supply.

NOV. 1, 1884.—Dear Sir—I have been looking out for a bitch for you, but they are very hard to find. I have another one offered me and I am going to have her sent to me to look at, and if right I will have her bred to Obo. * * * You were written to before now telling you that I was doing my best in the matter, so I suppose the letter miscarried. * * I shall hurry up as much as I can about your bitch, but good ones are very scarce, except at prohibitory figures, such as £150, etc.—L. CLEMENT, W. P.

FEB. 19, 1885.—Dear Sir—I have a very handsome black cocker bitch for you and will send her on Saturday next with full details.—L. CLEMENT.

Nothing was heard further from "Wildfowler" until it was necessary to call upon Mr. Cummings to renew his subscription to the *Shooting Times*, and he was written to to that effect under date of April 4, 1885. Perhaps this reminded "Wildfowler" of his having received $90 from his correspondent a year before, so he backed the subscription letter with the following, signed by himself:

The prices of black spaniels have risen enormously. Langdale sold one for £70 lately. So you may see what difficulties I have to contend with in getting you one. I had three young ones offered me yesterday by a gamekeeper. I will see them and send you one if it is good enough. I have seen at least forty for you, but they were either bad or else far too dear. However, I hope to eventually please both you and myself in the choice. I intend starting a kennel in America, and probably will send your bitch with my first batch of dogs. I will write you again in a day or two if I secure one of the three bitches I am mentioning above.—L. CLEMENT.

Mr. Cummings next received the communication given below, which is the last he has heard from the reliable "dog broker" recommended by the editor of one of our sportsmen's papers:

MAY 18, 1885.—Dear Sir—I have put your name on our subscribers' list for a year and the paper shall be duly sent. You will see that I state the impossibility I have experienced in getting a black cocker bitch. There are now none to be had under £70 or £80 as they are so fashionable, but if you had been willing to go have (*sic*) a young bitch I had one offered me which would have suited you admirably. However, if you do not wish for one now will you please deduct from the amount the subscription fee and draw upon me at sight for the balance. Or if you want to start bassets I can send you my dog Flambeau II. at once. He ought to fetch a large price in America as he is very handsome, and is a wonderfully good dog on all game. You would be very well pleased with him and could get a rattling price for him. He can start on receipt of a cablegram, if you would like to have him, at once.—L. CLEMENT.

STUD FEES.

Editor Forest and Stream:

As Mr. Anthony desires my real name he can have it willingly, with a few additional remarks. Imprimis, let me say, that I simply chose Graphic as the example of the highest stud fee asked, and from no desire to affront his owner or injure the dog's reputation. I never denied Mr. Anthony's right to do as he pleased with his own property, and nothing in my letter should have conveyed any such idea. But in what I deem the interest of breeding and breeders, I have just as much right to question the fees fixed as the owners have to fix them. I cannot dictate to Mr. Anthony or any other breeder what fee he shall fix, but I surely can criticise his action when I base my criticism on the broad public grounds on which I did. I consider Mr. Anthony utterly wrong in thinking that a prohibitory fee will keep away all bitches of doubtful pedigree, while it certainly will keep away good bitches owned by gentlemen of very moderate means. A man can own a good dog without being a millionaire, and though we may not all own Graphics, we can at least possess blood as pure. As to keeping a secretary to look up pedigrees, that's mere talk. If Mr. Anthony does not keep in his head a certain run of pedigrees he ought not to go into pointer breeding, and surely, living as he does under the very shadow of FOREST AND STREAM'S wing, he could easily unravel any doubt without much strain on either his mind or his time. I could not, of course, gather Mr. Anthony's liberal intentions regarding the use of stud fees from the advertisement in your columns, and even now, when I grasp the idea, it rather strikes me as a species of "robbing Peter to pay Paul." The latter part of Mr. Anthony's letter seems a good deal about his dog and very little about stud fees. As I am writing about the last I shall certainly not question any of his statements, though I am free to say the one regarding Graphic's progeny is a stiff jump to negotiate. Mr. Anthony has evaded the issue I made, and seems to want to put the matter on a personal footing. This I absolutely decline, as I have no personal feeling or interest in the matter, and unless he can discuss stud fees in the abstract and a trifle more logically, I retire from the field.

T. B. DORSEY ("Surrey").

THE NEW SETTER STANDARD.

Editor Forest and Stream:

It is many weeks since Mr. Osborn, secretary A. K. C., mailed the following instructions to the standard committees:

American Kennel Club, Secretary's office, Birmingham, Conn., May 27, 1885.—*Dear Sir*—At a meeting of the A. K. C., held in Philadelphia, May 19 and 20, you were appointed one of a committee of three on a standard, for judging ————. The other members of your committee are————. Please confer with them on the subject. The instructions are to inform yourself as to the ideas of the different breeders and exhibitors, and agree, if possible, on a standard, and report to me on or before Oct. 1, 1885. Respectfully —G. EDWARD OSBORN, Sec. A. K. C.

Some weeks later Mr. Osborn, in a letter to the *Sporting Life*, said: "My instructions at the Philadelphia meeting were to request the committees to confer with the breeders and exhibitors in the matter and get their views, and I have done so." Mr. Osborn, no doubt, did as he says, but have Messrs. Taylor and Bryson "conferred with the breeders and exhibitors," and if so, which exhibitors and breeders have they conferred with. These gentlemen say they have agreed upon a standard and are ready to report. Halt! None but members of a certain clique have been consulted, and it is only reasonable to presume that an attempt will be made to juggle the Tennessee standard through the next meeting of the A. K. C.

Who are breeders and exhibitors of setters besides J. M. Taylor, J. M. Avent, Bryson Bros., C. B. Whitford and his august master? Have Messrs. Taylor and Bryson ever heard of Messrs. Smith, of Strathroy, C. H. Raymond, John Davidson, Theodore Morford, B. F. Wilson, Ethan Allen, C. S. Westcott, Dr. Fleet Speir, D. T. Charles, J. Otto Donner, Luther Adams, T. G. Davey, E. Herzberg, Blackstone Kennels, Goodsell Kennels, E. J. Martin, W. Tallman, F. Windholz, Howard Hartley, J. M. Tracy, and a hundred or more of others who have been snubbed because Taylor and Bryson know they will have none of it?

So bitter is the feeling against Major Taylor that several prominent exhibitors have stated their intention of never again submitting their exhibits to his judgment. He has not only made a laughing stock of the A. K. C., but has ended his career as a judge at Eastern shows. His decisions in favor of Paul Gladstone and Juno A. at the Philadelphia show were duly noted, and in them may be found the key to Taylor's intentions in this standard business. At the rate he is traveling he will soon have dog shows to himself, and the only entries will be those of Paul Gladstone, Juno A., Gladstone, Gladstone's Boy, Sue, etc.

If Major Taylor's intentions in this standard question are sincere why did he not consult with those who have had considerably more experience than himself? If a standard is to be framed to fit Paul Gladstone and Gladstone stock generally, what objection can be made to some qualified persons making a standard for setters? If snipe-faced weeds have a claim to be called setters, why, may I ask, did Major Taylor confer honors upon Thunder, Emperor Fred, Plantagenet, etc.? He told us they were the best dogs in the world, whereas it now appears they were mongrels. Certainly they were not setters if Paul Gladstone is a setter. Is it possible that all that time Major Taylor didn't know what a setter should be, or (what is now probable) is he giving us the second volume of "Construction"? I have ignored Mr. Higgins's name on the committee, for as "Porcupine" puts it in the *Sporting Life*, "Taylor and Bryson to outvote Higgins is much too thin."

Let me offer a suggestion. It is that you, Mr. Editor, open the pages of FOREST AND STREAM to a list of names of all persons in favor of and opposed to any change of the standard unless indorsed by such well-known breeders as I have mentioned, for the English setter. Such action on your part would insure justice to all. In the event of FOREST AND STREAM refusing to grapple this question it will become the imperative duty of exhibitors, breeders and owners to adopt Mr. Mason's plan of framing a public protest. The FOREST AND STREAM has never been behind in defending the rights of dog lovers, which makes me hopeful that my request will be favorably considered. As I hate newspaper notoriety I will at present sign myself JUSTITIA.

[We should be glad to have the views of our readers on this subject for publication. It is the duty of every breeder and exhibitor to go on record in this matter. If this is done our correspondent need have no fears that the American Kennel Club will adopt a standard that will not be satisfactory.]

PHILADELPHIA FALL DOG SHOW.

Editor Forest and Stream:

It was decided on last Saturday by the Philadelphia Kennel Club to hold a bench show of dogs in conjunction with the Pennsylvania Agricultural Society, during the week beginning Oct. 5 next.

It is the intention of the Philadelphia Kennel Club to make such arrangements as will insure this exhibition to be one of the largest ever held in the United States.

A new departure will be made from the general plan of dog shows, and instead of benching the animals in a building which cannot otherwise than be close, long and substantial sheds will be erected and each kennel will be separated, thus greatly lessening the chance of sickness. The prize list will be a very liberal one and special prizes will be offered for kennels of five or more in many classes. Trials of sheep driving will be given, and for the benefit of exhibitors an express office will be located on the grounds. Due notice will be made to your paper of detailed arrangements. HOMO.

THE ENGLISH COLLIE CLUB.

AT a meeting of the Collie Club, held at the Crystal Palace on Tuesday afternoon, July 7, the following description of the dog whose interests the members study was adopted:

"The skull of the collie should be quite flat and rather broad, with fine tapering muzzle of fair length and mouth the least bit overshot, the eyes widely apart, almond shaped and obliquely set in the head; the skin of the head tightly drawn, with no folds at the corners of the mouth; the ears as small as possible, semi-erect when surprised or listening, at other times thrown back and buried in the 'ruff.'

"The neck should be long, arched and muscular, the shoulders also long, sloping and fine at the withers; the chest to be deep and narrow in front, but of fair breadth behind the shoulders.

"The back to be short and level, with the loin rather long, somewhat arched and powerful. Brush long, 'wi' upward swirl' at the end, and normally carried low.

"The forelegs should be perfectly straight, with a fair amount of flat bone; the pasterns rather long, springy, and slightly lighter of bone than the rest of the leg; the foot with toes well arched and compact, soles very thick.

"The hindquarters, drooping slightly, should be very long from the hip bones to the hocks, which should be neither turned inward nor outward, with stifles well bent. The hip bones should be wide and rather ragged.

"The coat, except on legs and head, should be as abundant as possible; the outer coat straight, hard and rather stiff. the under coat furry and so dense that it would be difficult to find the skin. The 'ruff' and 'frill' especially should be very full. There should be but little 'feather' on the forelegs, and none below the hocks on the hindlegs.

"Color immaterial.

"SYMMETRY.—The dog shall be a fair length on the leg, and his movements wiry and graceful. He should not be too small—height of dogs from 22in. to 24in., of bitches from 20in. to 22in.

"The greyhound type is very objectionable, as there is no brain room in the skull, and with this there is to be found a fatuous expression, and a long, powerful jaw.

"The setter type is also to be avoided, with its pendulous ears, full soft eye, heavily-feathered legs, and straight short flag.

"The smooth collie only differs from the rough in its coat, which should be hard, dense and quite smooth.

SCALE OF POINTS.

Head and expression	15
Ears	10
Neck and shoulders	10
Legs and feet	15
Hindquarters	10
Back and loins	10
Brush	5
Coat with frill	20
Size	5—100

"NOTE—Point judging is not advocated, but figures are only made use of to show the comparative value attached to the different properties; no marks are given for 'general symmetry' which is of course in judging a point of the utmost importance."—*London Field.*

"TRAINING VS. BREAKING."—Some weeks ago Mr. C. M. Stark, of Dunbarton, N. H., asked if we could tell him something about the force system and how to apply it. We advised him instead of employing that system, to read "Training vs. Breaking," by S. T. Hammond, kennel editor of FOREST AND STREAM, and to train his puppy by the directions there laid down. Now he writes: "I have found your work, 'Training vs. Breaking,' of great assistance. It has given me a great deal of satisfaction. My young dogs have improved rapidly during the last few days. They both now charge, to-ho, fetch and come to heel, in a very satisfactory manner. I did not get them when they were quite as young as I wished, they being over nine months old before I commenced to handle them. I have now handled them for two weeks, and think a couple of weeks more will make them pretty near perfect. I follow your instructions about 'going slow.'"

EASTERN FIELD TRIALS JUDGES.—*Editor Forest and Stream:* At a special meeting of the Board of Governors of the E. F. T. C. held July 22, in New York city, it was announced that Daniel C. Bergundthal, Esq., of Indianapolis; John Hunter, Esq., and Elliot Smith, Esq., of New York city, have signified their acceptance of the club's invitation to judge at the Eastern Field Trials of 1885, and that in case of any vacancy occurring or another judge being required the club will select the same from it members, among whom may be mentioned Messrs. J. W. Orth, J. Otto Donner, Washington A. Coster, B. F. Wilson, F. R. Hitchcock and Justus von Lengerke.—WASHINGTON A. COSTER, Secretary and Treasurer.

"BLAME IT ON THE EDITOR."—Hulton, Pa., Aug. 1.—*Editor Forest and Stream:* "Blame it on the editor" that the W. K. C. was omitted from my list of clubs who are the main stays of dog shows.—W. WADE. [The editor had nothing to do with the omission of the club named. We did consider the propriety of inserting the name in the revise of Mr. Wade's letter, presuming that the omission was unintentional.]

THE DAYTON DOG SHOW.—*Editor Forest and Stream:* The Southern Ohio Fair Association will hold their third annual bench show of dogs in connection with their tenth annual fair, Sept. 29 and 30, and Oct. 1 and 2. The regular premium list and a list of a large number of valuable special prizes can be had by application to Mr. H. Anderson, Secretary, Sheriff's Office, Dayton, O.—B. F. S.

LOVE ME, LOVE MY DOG.—Col. "Bob" Ingersoll went down to the Oriental Hotel at Coney Island last week with his family and a big Newfoundland. The rules of the hotel forbade the dog's staying there; and Ingersoll repacked his baggage, and with his family and the dog left the hotel for some other house where the dog would be entertained.

ROSE'S PEDIGREE WANTED.—A correspondent wishes to learn the pedigree of the Gordon setter bitch Rose, formerly owned in Hartford, Conn., and sent from there to Louisville, Ky. Any one knowing anything about her will confer a favor by communicating with us.

GRAPHIC.—We have received a letter from Mr. Jas. L. Anthony, the owner of the pointer Graphic, stating that he has withdrawn him from the public stud. This does not include services already promised.

KENNEL NOTES.

NOTICE TO CORRESPONDENTS.

Kennel notes are inserted in this column free of charge. To insure publication of notes, correspondents MUST GIVE the following particulars of *each animal:*

1. Color.
2. Breed.
3. Sex.
4. Age, or
5. Date of birth, of breeding or of death
6. Name and residence of owner buyer or seller.
7. Sire, with his sire and dam.
8. Owner of sire.
6. Dam, with her sire and dam.
10. Owner of dam.

All names must be *plainly* written. Communication on one side of paper only, and signed with writer's name.

NAMES CLAIMED.

☞ *See instructions at head of this column.*

Foreman II., Count Berwick, Count Graphic, Glendale, Countess May, Countess Helen, Countess Nellie, Countess Alice, Countess Mattie, Countess Nora and Daisey Foreman. By Andrew J. Calahan, New Haven, Conn., for white, black and tan English setters, four dogs and seven bitches, whelped July, 1885, by Blackstone Kennels' Foreman out of his Jolly Nell (Goodsell's Prince—Jolly May).

Senator and Secretary. By Frank F. Dole, New Haven, Conn., for white bull-terrier dogs, whelped May 27, 1885, by President (A.K.R. 1208) out of Little Nellie (Paddy— ——).

Princess Starlight. By Chas. York, Bangor, Me., for black, white and tan English setter bitch, whelped April 25, 1885, by Dashing Dan out of Daisy Starlight.

Brunswick, Cardinal, Marlborough, Berneta, Bernaline and Hermita. By Essex Kennels, Andover, Mass., for St. Bernards (instead of mastiffs, as given last week), three dogs and three bitches, whelped July 20, 1885, by champion Hermit (A.K.R. 28) out of Daphne II. (A.K.R. 489).

Iron Duke. By Geo. Jarvis, New York, for black and white ticked English setter dog, whelped April 25, 1885, by Gun (A.K.R. 1538) out of Morning Star (A.K.R. 1541).

Maud S. By John Dietch, New York, for black and white ticked English setter bitch, whelped April 25, 1885, by Gun (A.K.R. 1538) out of Morning Star (A.K.R. 1541).

NAMES CHANGED.

☞ *See instructions at head of this column.*

Gyp to Trailer. Black, white and tan beagle dog, whelped June, 1883 (Racket—Fly), owned by Herman F. Schellhass, Brooklyn, N. Y.

BRED.

☞ *See instructions at head of this column.*

Trouble—The Earl. George Jordan's (Montreal, Can.) bull-terrier bitch Trouble to Royal Bull-Terrier Kennels' The Earl (Marquis—Lady), June 9.

Blackie III.—Obo II. J. P. Willey's (Salmon Falls, N. H.) cocker spaniel bitch Blackie III. (A.K.R. 428) to his champion Obo II. (A.K.R. 422), July 3.

Shina—Young Obo. J. P. Willey's (Salmon Falls, N. H.) cocker spaniel bitch Shina (A.K.R. 1484) to his Young Obo (A.K.R. 861), July 10.

Blue Gown—Dashing Lion. G. W. Ballantine's (Washingtonville, O.) English setter bitch Blue Gown (Blue Dan—Flake) to his Dashing Lion (Dash II.—Leda), July 20.

Daisy—Dashing Lion. G. W. Ballantine's (Washingtonville, O.) English setter bitch Daisy (Pembroke—Gift) to his Dashing Lion (Dash II.—Leda), July 26.

Fly—The Earl. M. Dorsey's (Hartford, Conn.) brindle bull-terrier bitch Fly to Royal Bull-Terrier Kennels' The Earl (Marquis—Lady), May 5.

Yoube—Chief. Max Wenzel's (Hoboken, N. J.) red Irish setter bitch Yoube (Elcho—Rose) to his Chief (A.K.R. 231), July 18.

Doe—Chief. Max Wenzel's (Hoboken, N. J.) red Irish setter bitch Doe (Buck—Floss) to his Chief (A.K.R. 231), July 27.

Frank—Dashing Lion. G. W. Ballantine's (Washingtonville, O.) English setter bitch Frank (Fred—Alena) to his Dashing Lion (Dash II.—Leda), July 12.

Victoria—Grand Duke. T. R. Varick's (Manchester, N. H.) bull-terrier bitch Victoria (A.K.R. 1893) to champion Grand Duke (A.K.R. 524), July 24.

Noreen II.—Chief. John F. Dwight's (Boston, Mass.) red Irish setter bitch Noreen II. (A.K.R. 1196) to Max Wenzel's Chief (A.K.R. 231), July 15.

Lady Bess—Chief. J. A. Cathcart's (Atlantic City, N. J.) red Irish setter bitch Lady Bess (A.K.R. 2178) to Max Wenzel's Chief (A.K.R. 231), July 13.

Bessie—Fritz. W. W. Hurd's (Hartford, Conn.) pointer bitch Bessie (Duke—Rose) to A. C. Collins's Fritz (A.K.R. 1249), July 28.

Daisy Queen—Druid, Jr. Howard Hartley's (Pittsburgh, Pa.) English setter bitch Daisy Queen (A.K.R. 2366) to his Druid, Jr. (Druid—Swaze).

Lady May—Emperor Fred. Dr. S. Fleet Speir's (Brooklyn, N. Y.) English setter bitch Lady May (St. Elmo IV.—Ladie Fayre) to his Emperor Fred (A.K.R. 33), July 28.

Gypsie Queen—Little Duke. Chas. Willard's (Westerly, R. I.) beagle bitch Gypsie Queen (Briar—Bush) to A. H. Wakefield & Co.'s Little Duke (A.K.R. 1994), June 22.

Flora—Leader. J. A. Smith's (Mapleville, R. I.) beagle bitch Flora to A. H. Wakefield & Co.'s Leader (A.K.R. 319).

Oxey—Obo, Jr. D. Durward's (Simcoe, Ont.) black cocker spaniel bitch Oxey (Tippo—Beauty) to Andrew Laidlaw's Obo, Jr. (A.K.R. 1481), May 29.

Black Meg—Obo, Jr. R. McKin's (Simcoe, Ont.) black cocker spaniel bitch Black Meg (Beau—Black Bess) to Andrew Laidlaw's Obo, Jr. (A.K.R. 1481).

Topsy—Obo, Jr. J. G. Lapp's (Suspension Bridge, N. Y.) cocker spaniel bitch Topsy to Andrew Laidlaw's Obo, Jr. (A.K.R. 1481).

Woodstock Flirt—Obo, Jr. F. E. Curtis's (Simcoe, Ont.) cocker spaniel bitch Woodstock Flirt (A.K.R. 661) to Andrew Laidlaw's Obo, Jr. (A.K.R. 1481), June 13.

Juno W.—Obo, Jr. Andrew Laidlaw's (Woodstock, Ont.) black cocker spaniel bitch Juno W. (A.K.R. 2190) to his Obo, Jr. (A.K.R. 1481), July 23.

WHELPS.

☞ *See instructions at head of this column.*

Lilly Queen. Thos. M. Steele's (Dover, N. H.) English setter bitch Lilly Queen, July 14, four (one dog), by his Donzel (A.K.R. 816).

Cad L. A. R. Place's (Dover, N. H.) English setter bitch Cad L. (A.K.R. 1455), July 25, nine (four dogs), by Thos. M. Steele's Donzel (A.K.R. 816).

Maud S. E. S. Herancourt's (Cincinnati, O.) Gordon setter bitch Maud S. (King—Rose), July 4, seven (three dogs), by C. R. Taylor's Gem A.K.R. 959).

Queenstown. C. A. Blaisdell's (Chicago, Ill.) Irish water spaniel bitch Queenstown (champion Barney—Irish Nell), July 23, eight (three dogs), by H. D. Gardner's Jerry O'Connor (Dan O'Connor—Mollie McGuire).

Fly. M. Dorsey's (Hartford, Conn.) bull-terrier bitch Fly, July —, six (four dogs), by Royal Bull-Terrier Kennels' The Earl (Marquis—Lady).

Sheila. K. E. Hopf's (Newark, N. J.) St. Bernard bitch Sheila (A.K.R. 796). July 29, five bitches, by E. R. Hearn's champion Duke of Leeds (A.K.R. 1535); one since dead.

Meggie. J. D. Culver's (New London, Conn.) red Irish setter bitch Meggie (A.K.R. 836), July 31, ten (seven dogs), by L. W. Dart's Neff (A.K.R. 2047).

Jet W. J. P. Willey's (Salmon Falls, N. H.) cocker spaniel bitch Jet W. (A.K.R. 851), July 16, seven (three dogs), by his Black Pedro (A.K.R. 1474); all black.

Mona Moya. J. H. Wall's (Lynn, Mass.) red Irish setter bitch Mona Moya (A.K.R. 2083), July 16, six (two dogs), by W. H. Pierce's champion Gleucho.

Belle Stubbs. Ideal Kennels' (New Haven, Conn.) cocker spaniel bitch Belle Stubbs (Col. Stubbs—Fanny Fern), July 10, five (four dogs), by their Pilot (Sam—Daisy Dean); liver and white.

SALES.

☞ *See instructions at head of this column.*

Gun (A.K.R. 1538)—Pearl Blue (A.K.R. 1542) whelp. Black, white and tan English setter dog, whelped July 19, 1884, by Charles York, Bangor, Me., to D. R. Williams, Seymour, Conn.

Obo, Jr.—Darkie II. whelp. Black cocker spaniel dog, whelped May 7, 1885, by Ideal Kenneis, New Haven, Conn., to D. H. Moore, Athens, O.

Jet—Rita whelps. Black cocker spaniels, whelped May 20, 1885, by Ideal Kennels, New Haven, Conn., a dog to A. V. Sedgwick, Stockbridge, Mass., and a bitch to S. G. Moses, Hartford, Conn.

Brahma. Black cocker spaniel dog, whelped March 19, 1885 (Brahmin—Woodland Queen), by Andrew Laidlaw, Woodstock, Ont.) to J. H. Perry, Southport, Conn.

Negress III. Black spaniel bitch, whelped Nov. 1, 1884 (Lad o' Devon—Dinah), by Andrew Laidlaw, Woodstock, Ont., to E. W. Durkee, New York.

Woodstock Flirt. Black spaniel bitch (A.K.R. 661), by Andrew Laidlaw, Woodstock, Ont., to F. E. Curtis, Simcoe, Ont.

Toronto Jet. Black cocker spaniel bitch (A.K.R. 860), by Andrew Laidlaw, Woodstock, Ont., to J. P. Willey, Salmon Falls, N. H.

Sport. Black and white cocker spaniel dog, 2½yrs. old (Jet—Daisy), by Andrew Laidlaw, Woodstock, Ont., to Chas. McBurney, New York.

Brahmin—Woodland Queen whelps. Cocker spaniels, whelped March 19, 1885, by Andrew Laidlaw, Woodstock, Ont., a black dog to W. H. Gale, New Haven, Conn., and a liver dog to H. H. Vail, Cincinnati, O.

Glenmark—Zanetta (A.K.R. 1261) whelps. Lemon and white pointers, whelped March 31, 1885, by W. F. Todd, Portland, Me., a dog to G. H. McKenny and F. W. Thompson, and a bitch to L. M. Sawyer, same place; a bitch to H. C. Burkman, Rockland, Me., and a bitch to W. E. Jones, Attleboro, Mass.

Chase. Beagle bitch, color and age not given (Ringwood—Winnie), by N. Elmore, Granby, Conn., to A. H. Wakefield & Co., Providence, R. I.

Pet. White, black and tan beagle bitch, whelped May 29, 1883 (Racer—Vic), by J. F. Gorham, Leominster, Mass., to W. E. Deane, Somerset, Mass.

Nell II. Clumber spaniel bitch, whelped July, 1884 (Smash II.—Romp II.), by Geo. Piers, Halifax, N. S., to F. H. F. Mercer, Ottawa, Ont.

Anthony. White bull-terrier dog, whelped April 28, 1885 (Hinks's Dutch—White Rose), by Frank F. Dole, New Haven, Conn., to Chas. Stevens, Hoboken, N. J.

Joe—Judy whelps. Pug dogs, whelped May 14, 1885, by C. T. Brownell, New Bedford, Mass., two to Miss A. H. Whitney, Lancaster, Mass.; one to H. E. Norton, Ironton, O.; one to J. F. McChesney, Little Falls, N. Y., and one to J. B. Hurlbutt, Norwalk, Conn.

Gyp. Black, white and tan beagle dog, whelped June, 1883 (Racket—Fly), by N. Elmore, Granby, Conn., to Herman F. Schellhass, Brooklyn, N. Y.

PRESENTATIONS.

RANGE AND GALLERY.

WESTERN RIFLE ASSOCIATION.

THE fifth annual tournament of the Western Rifle Association will be held at the Western Union Junction, Racine county, Wis., opening Aug. 24 and running four days. The N. R. A. rules govern and the programme provides matches as follows, with a liberal prize list promised:

Monday, Aug. 24.—Match No. 1. Individual Short Range—Fifteen shots each at 200yds.; military rifles allowed 3 points.

Match No. 2. Individual Mid Range—Ten shots each at 500yds., military rifles allowed 2 points.

Match No. 3. Individual Mid and Long Range—Five shots each at 500, 600, 800, 900 and 1,000yds., 2 sighting shots at 500yds. only, military rifle sights allowed 1 point at each distance, first prize one of D. S. Cole's long range rifles, valued at $125, donated by the citizens of Columbus Junction, Iowa.

Match No. 4. Individual Revolver—Ten shots each at 30yds., Massachusetts target for 4-inch barrels and under.

Tuesday, Aug. 25.—Match No. 5. Short Range Teams.—Teams of 6 men each, 10 shots each at 200yds., first prize Western Rifle Association short range champion gold badge, donated by the Minneapolis *Tribune*, Minneapolis, Minn.

Match No. 6. Individual Long range.—10 shots each at 800, 900 and 1,000yds., two sighting shots at 800yds. only, military rifles allowed one point at each distance.

Match No. 7. Individual Match at 1,000yds.—30 shots each, first prize Western Rifle Association champion marksman gold badge.

Wednesday, Aug. 26.—Match No. 8. Long Range Team Match.—Teams of 6 men, 800, 900 and 1,000yds., 15 shots each, 2 sighting shots at 800yds., first prize the American field long range gold badge, valued at $150, to be won 4 times to become the personal property of the team.

Match No. 9. Bullseye Match—200yds., 10 shots each, no cleaning, no sighting shots, 8-inches bullseye, bullseyes only to count on score.

Match No. 10. Individual Revolver—15 shots each, at 100yds. on Mass. target for 8 inch barrels and under.

Thursday, Aug. 27.—Match No. 11. Military Teams—Teams of 6 men each, seven shots each at 200, 500 and 600yds., 2 sighting shots 200yds. only; first prize, Western Rifle Association champion military badge, donated by the Pioneer Press of St. Louis, Minn.

Match No. 12. Individual Military—7 shots each at 200 and 500yds., open to all military rifles.

Match No. 13. Commissioned Officers' Match—200yds., 10 shots, open to any commissioned officer of any State or regular army.

MANCHESTER, N. H.—I inclose scores of the Manchester Rifle Club in a match on Creedmoor target which ended Aug. 1. We have two matches started to keep the ball rolling, which run for about three months each, thus keeping up the interest among the members. The scores have been running since April last. There were 11 winners, and out of a possible 1650 these riflemen made 1504, which is considered as very fine work. The summary follows:

Creedmoor Target—Prize Match.

Three cards of 10 shots each, possible 150, entries unlimited:

A B Dodge	5455555555—49	5555555555—49	—147
C D Palmer	4555555555—49	4454555553—47	—143
John Lawrence	4545455545—46	5455455545—47	5454455554—46	—139
C W Lyman	4445455555—46	4455555554—47	5554554454—46	—139
E C Paul	5454545545—46	4445455455—45	5455545544—46	—137
J B Anthony	4545454554—45	4445545455—45	5555544445—46	—136
W Graham	5554454445—45	5454554455—45	4454554455—45	—135
Thomas Pinch	4555454444—44	4455445554—45	5454554445—45	—134
G A Leighton	4445554354—43	4455454545—45	5454455454—45	—133
F J Drake	5554443545—43	4545444554—44	4554445544—44	—131
J Hodge	4555453445—43	5455454554—44	4444545444—43	—130
E I Partridge	4445445545—44	4544444544—42	4445445444—42	—128
Moses Wadleigh	4444444454—40	4544444444—41	5454444555—45	—126
W H Thomas	4555444454—44	4344454445—41	3544344453—39	—124

WALNUT HILL RANGE, Aug. 1.—To-day's shoot was not well attended. Many of the shooters are away on their vacations. The weather conditions were fairly good, except a heavy shower at 5 o'clock, which stopped the shooting for the remainder of the day. Following are the scores:

Decimal Match.

A C White, C	8	8	10	8	9	9	7	9	9	10—87
W H Oler, C	8	7	8	7	9	9	10	9	10	7—84
R Dadman, C	10	8	7	9	5	8	9	6	10	9—81
J N Frye	7	5	10	8	6	5	8	8	8	9—74
F Agains	9	9	6	4	4	9	5	10	5	6—70

Practice Match.

F W Perkins, M	5	4	5	4	4	5	4	4	4	4—43
C W Hodgdon	4	4	4	4	3	4	5	5	4	4—41

State Militia Match.

Private L Grant	21	22	21

Rest Match.

J Francis	10	10	10	10	10	10	10	8	9	10—97
S Wilder	10	10	10	8	10	10	9	10	9	10—96
J N Frye	9	10	10	10	8	9	10	10	9	10—95
B G Warren	10	10	10	10	10	9	8	8	8	8—93
J Bellows	10	10	7	10	9	8	10	10	9	9—92
Hale	8	8	6	10	9	8	9	8	7	6—79
F Henry	9	5	6	7	4	8	2	7	7	9—64

THE ELCHO SHIELD.—London, July 23.—England again takes the Shield, but with a close rub all around. The weather was extra fine, the wind extra tricky. The result makes England twelve times a winner, Ireland seven times and Scotland five times. Sir Henry Wilmot was the English Captain, and was heartily cheered at the finish, Sir Henry Halford responding, Col. Wilson for the Scots and Adjutant Doyle of the Irish Eight also spoke. The scores stood:

	800yds.	900yds.	1000yds.	Total.
England:				
Turner	69	71	71	209
Deeley	68	67	68	203
Gibbs	70	68	65	203
Hunt	70	71	58	199
Whitehead	71	65	58	194
Freemantle	67	69	65	192
Arrowsmith	64	65	61	190
Gilder	63	59	62	184
	542	524	508	1574
Scotland.				
Gibson	66	69	70	205
Caldwell	71	69	62	202
Thorburn	70	69	62	201
Boyd	64	67	69	200
McVittie	69	64	64	197
McKerrell	65	63	67	195
Fraser	59	56	64	189
Johnston	66	59	54	179
	510	516	512	1568
Ireland.				
Young	74	70	60	204
Murphy	67	68	68	203
Cooper	70	62	68	200
Braithwaite	71	71	58	200
Joynt	68	65	58	191
Gauly	66	63	61	190
Barnett	67	62	56	185
Rigby	71	56	54	181
	554	517	483	1554

CREEDMOOR, Aug. 1.—The sixth champion marksman's class match was shot to-day. The weather was trying in the morning, but after lunch some fine scores were made. J. F. Klein, of the 17th Separate Company, was the winner of the gold badge, with the handsome score of 23 and 25, total 48, the highest of the season. The following were some of the best scores. Shepherd, Joiner, Wallace and Frothingham being winners in former matches, were not eligible to share in the division of entrance money:

T J Dolan, 12th Reg	22	24—46	G Joiner, 23 Reg	22	21—43
J S Shepherd, 12th Reg	21	24—45	W T Sullivan, 23d Reg	19	23—42
J H Brown, 7th Reg	22	22—44	J B Frothingham, 23d	19	23—42
W H Palmer, 7th Reg	20	23—43	D Bacon, 7th Reg	22	20—42
R Oliver, 23d Reg	21	22—43	C C Wallace, 14th Reg	18	23—41
T M Harvey, 14th Reg	21	22—43			

THOMASTON, Conn., Aug. 1.—In the first part of the shoot at Bridgemoor range to-day, the sun was shining and we had a very bright light, but soon the approach of a heavy shower made the light very dark and bad. We also had a tricky wind veering from 9 to 11 o'clock.

Massachusetts Decimal Target.

W H Dunbar	6	6	8	8	9	10	8	8	8—76
G C Gilbert	8	7	7	8	6	7	7	6	10 9—75
G A Lemmon	10	6	6	5	7	8	10	9	4 9—74
E Thomas	7	10	5	5	6	8	4	8	5 7—65
Fred A Perkins	6	5	5	8	9	4	4	3	10 8—62
C L Alling	3	5	7	1	10	6	8	3	10 4—57
A Fox	6	8	6	3	2	0	7	7	9 8—56

WIMBLEDON.—The entire meeting has been a grand success in scores, in crowds, in order and most important, in weather. The Council have shown a wise liberality in giving an attractive prize list, and that it was appreciated the increased entry lists demonstrated. A novelty was the revolver match, and one critical observer who stood by says: "For the first time at Wimbledon, a competition was commenced with the revolver. This deadly little weapon has never received in this country the attention it deserves, and as a consequence we are not only far less skillful in its use than any other nation, but our service weapon is inferior to that of any other power. The range was 20yds. only at a target 12in. in diameter with a 3in. bull. Out of those who fired many never touched the 12in. disc, while others only succeeded after dwelling on the aim in a fashion that would hardly have been practicable in front of a Zulu or an Arab, in getting one or two through the pasteboard. The poor practice demonstrated the necessity of some such stimulus to revolver-shooting as a Wimbledon competition will give, and it is to be hoped that next year it may be made a more important feature of the meeting.

RIFLE NOTES.—The Hillside, Mass., Club shot a telegraphic match Aug. 1, with the Jamestown, N. Y., Club, which resulted in favor of the Jamestowns by a score of 290 to 288. A. G. White, of Worcester, made a fine score at Walnut Hill on Saturday last, five consecutive scores in the decimal match were, 77, 81, 84, 85, 86. This is considered by many the best record yet made. There is a movement on foot at Walnut Hill to send a team to the fall meeting of the National Rifle Association at Creedmoor. The Boston *Press* men shot a match on Aug. 1 with the Hillside Rifle Club, 9 men a side, Creedmoor target, 7 shots. The score stood: *Press* men 264, Hillside Club 253. The rifle competitions of the Department of Dakota will take place at Fort Snelling, Aug. 12 to 15. The Division of the Missouri contests will take place on the same range instead of at Fort Leavenworth. The Department of the Missouri matches will take place at Fort Leavenworth Aug. 5 to 15. The Department of Texas at Fort Clark Aug. 7 to 11. The Division of the Pacific at the Presidio, San Francisco, Aug. 30 to 27. Department of the Columbia at Vancouver Barracks, Aug. 3 to 8. Department of California at the Presidio, Aug. 3 to 8, and the Department of Arizona at Whipple Barracks, Aug. 6 to 12. The time and place for the Department of the Platte matches has not yet been fixed, but the Omaha range will probably be used.

CONLIN'S GALLERY.—The shooting made by Messrs. Schuyler, Bird, Blydenburgh, Young, Griffin and others at this resort is something wonderful. The following records were copied from the blackboards in the gallery:

Records of rifle shooting at the French range and target, possible 70: J. B. Blydenburgh 68, Maynard Bisby 67, S. H. Hubbard 66, F. R. Waite 65, D. E. Marsh 65, R. V. R. Schuyler 68, Maynard Bixby at the "word" 65, A. C. White 66, D. F. Manice 65, P. M. Beers 65.

Rapidity and accuracy with rifle, shooting at the word: R. V. R. Schuyler 30 consecutive bullseyes and 99 bullseyes in 100 shots, W. B. Young 76 in 77. Pierre Lorillard, Jr., 34 in 35, George Bird 59 in 60. Mr. George Bird, with a Winchester .22-cal. repeater, at a Creedmoor 200 reduced to 25-yd. target, made a score of 115 out of a possible 125 in 29 seconds. Mr. E. H. Wales, with same rifle, made a score of 105 in 40 seconds, and Mr. J. F. O'Connor a score of 100 in 35 seconds.

Scores at 12yds., with rifle, at French target, possible 70: J. B. Blydenburgh full score, R. V. R. Schuyler full score, R. V. R. Schuyler full score at the word, W. B. Young 69, Marnard Bixby 68. J. L. Webb 63, E. H. Wales 65, J. N. Winslow 65, G. W. Hamilton 64, J. F. O'Connor 63, Edward Kelly 63, F. R. Waite 63, J. P. Lower 61, George Bird 67, R. B. Leard 67, Salo Strohein 67, E. E. Tiffany 64, J. A. Whelock 64, C. M. Donnely 63, Remsen Darling 63, Edward Kelly, at the word 61, M. J. Leard 59.

Pistol shooting at this target, possible 84: Wm. M. Chase 74, Pierre Lorillard, Jr. 69, D. A. Davis 71, Chas. F. Jones 70. Possible 70: Pierre Lorillard, Jr., at word, 61, duelling pistols 50, revolver 48. L. Ulmann 55, W. B. Young 53, P. Mitchell 52, Remsen Darling 49, Eugene Higgins (at word) 57, George Bird (.32-cal. S. & W. revolver) 38, R. V. R. Schuyler 53, H. H. Metcalf 53, Dr. F. C. Moller (duelling pistol) 38, F. Durand (.32-cal. S. & W. revolver) 38. J. B. Collins (revolver) 166 out of possible 210.

Fancy shooting records with rifle and pistol: Fred Sands, full score at swinging target, 1in. bull; R. V. R. Schuyler, at the word, split 10 cards consecutively, hit 13 small bullets in 15 shots and 9 pipe stems in 10 shots: R. B. Leard hit 14 pipe stems in 17 shots, at the word; Pierre Lorillard, Jr., hit 9 pipe stems in 10 shots with pistol; Maynard Bisby hit 11 small bullets in 14 shots at the word, and split 7 cards in 10 shots at the word; W. K. Griffin split 7 cards in 10 shots at the word, and hit 23 ½in. bullets consecutively at the word; W. B. Young split 6 cards in 7 shots at the word; Joseph T. Kelly split 7 cards in 10 shots at the word; N. F. Brisac hit 9 pipe stems in 10 shots at the word; Chas. F. Jones split 3 cards consecutively with pistol, and hit ace of harts 3 in 5 shots with pistol; Edward Kelly split 2 cards in 3 shots with pistol.

BERNE, Switzerland, July 20.—The great national shooting tournament and festival of Switzerland began to-day under the most favorable auspices. Ten thousand workmen partook of a mighty dinner in the open air, with gigantic shade trees for the walls and ceiling of their Titanic banqueting hall, and responded with rousing cheers to a variety of patriotic toasts and speeches. After the banquet a few preliminary rounds were shot off, but the more serious business of the tournament will begin to-morrow. This is the second of the series of similar events arranged for this summer, being sandwiched in between the recent great meeting at Bingen-on-the-Rhine and the coming international tournament, which opens at Innspruck, Austria, on the 7th of next month.

THE TRAP.

Correspondents who favor us with club scores are particularly requested to write on one side of the paper only.

RED WING, MINN.

Editor Forest and Stream:

The Red Wing Sportsman's Club, the Lake City Sportsman's Club and the St. Paul Gun Club enjoyed a pleasant shoot on the club's grounds in this city on July 29. The Red Wing club won the five-county gold badge and the St. Paul club won the Lilgowsky clay-pigeon medal, won by our club in the St. Paul State Tournament last year. Our club were at a little disadvantage in shooting at the doubles as the wind was blowing from the traps, carrying the smoke back in the shooter's face from the first discharge, which made it rather difficult to locate the second bird, while the St. Paul club were shooting the American wood powder, and the score shows its advantages in shooting at doubles. Five-county badge shoot, 15 glass balls, 18yds. rise:

CALIFORNIA NOTES.—The July shoot of the Alameda County Sportsman's Club was held at Bird's Point, Alameda, Saturday, the 18th. Live birds were used. Mr. Pollak carried off the honors with 12 straight, grassing his birds in fine style, using his second barrel only once, Bell, Houghton and Kellogg following up with 11 each. Following is the score:

Knowles	1111111110110—10	Mortimer	111011010101— 8
Norton	101111010111— 9	Houghton	111110111111—11
Monte	011100100011— 6	Pollak	111111111111—12
B-ll	111111111011—11	Adams	110011111111—10
Kellogg	111101111111—11		

After the regular shoot, a six-bird match was held with the following score:

Slade	0w.	Bell	111110—5
Norton	10w.	Pollak	111111—6

It will be seen that Pollak killed 18 straight birds, and Bell 16 out of 18.

At Shell Mound on the 19th a practice shoot also took place between eight members of Company C, Third Infantry, at 200yds., with the following score: Maginnis 42, Val. Heltren 32, Levy 38, Jones 24; total, 143. The next four scored thus: Macalpin 41, Fitzgerald 34, McBryan 39, Ryan 25; total 139.

Lieutenant A. C. Macalpin in a practice shoot scored 43, both with a Sharps and a Springfield rifle at 200yds.

HARTFORD, July 30.—Hammerless Gun Club; shoot for club medal:

CLUB SCORES.—*Correspondents who favor us with scores are requested to send them in as soon as possible after the matches described. We go to press Wednesdays; and it is necessary that matter for publication should be in hand by Monday, or Tuesday at the latest.*

THE WASHINGTON HEIGHTS GUN CLUB.—The third annual excursion on Monday, July 27, to Point View Grove. It proved a decided success. The day was all that could be asked for, there being a fine cool breeze the whole day. The sail from start to finish was simply delightful, and everybody on board made the most of it. One of the features at the grove was a friendly shoot at blackbird targets between members of the Washington Heights and Algonquin gun clubs, which resulted in a score of 31 to 28 in favor of the Algonquins. The excursionists arrived home at 8 P. M., well satisfied with their day's pleasure. The regular monthly shoot of the club took place at their club grounds, One Hundred and Sixty-seventh street and Ridge Road, Aug. 1:

CLUB SCORES.—*Correspondents who favor us with scores are requested to send them in as soon as possible after the matches described. We go to press Wednesdays; and it is necessary that matter for publication should be in hand by Monday, or Tuesday at the latest.*

WORCESTER, Mass., July 25.—The blackbird tournament to-day, under the auspices of the South End Gun Club, at the South End, attracted large numbers. Guests were present from Boston, Marlborough, Clinton, Providence and Oxford. Blackbirds are thought by many to be too frail and quick for general use. During the day 2,405 blackbirds and clay-pigeons were used. The day's sport included the following events:

1. Five clay pigeons—O. A. Dickey, of Boston, first; Henry W. Webber, of Worcester, second; W. L. Davis, of Worcester, third.

2. Seven blackbirds—Dickey and T. J. Baudry, of Marlborough, first; J. Adams, second; H. W. Eager, of Marlborough, and A. R. Bowdish, of Oxford, third; B. Franklin, fourth.

3. Peoria blackbird gold badge—There have been three contests for the badge, and the property is to become that of the man who secures it the greatest number of times out of six contests. It was first secured by H. W. Eager, of Marlborough; then by G. A. Samson, of Clinton, and then by Henry W. Webber, of Worcester. The contest was 12 single and 6 pairs, with a possible total of 24 with optional sweepstake. The result was as follows: H. W. Eager, 10; E. T. Smith, Worcester, 18; D. Deane, M. D. Gilman, of Worcester, and Samson, divided third; Bandry and Dickey divided fourth. The next contest is to be at Clinton, Saturday, Aug. 15.

4. Three pair clay-pigeons—Dickey and W. S. Perry, of Worcester, divided first, Eager and Webber divided second, Bowdish and Rice divided third, Adams fourth.

5. Seven clay-pigeons—Baudry and Smith divided first, Adams and J. Welch divided second, F. Payne 3, J. Moscroft fourth.

6. Seven blackbirds—Smith first, M. D. Gilman second, C. Emerson third, Davis fourth.

7. Five blackbirds—Eager first, Baudry second, Adams and Smith divided third.

8. Three pair clay-pigeons—Rice first, Dickey second, Adams and Emerson divided third.

9. Ten clay-pigeons—Eager first, Webber and Dickey divided second, Adams and Welsh divided third, Gilman fourth.

10. Five black birds—Eager first, Adams and Smith divided second, Perry and Davis divided third, L. Ingraham and E. S. Poore divided fourth.

11. Miss and out—Adams and Gilman divide.

12. Seven clay-pigeons—Webber first, Eager and Davis divided second, Bowdish, Welsh and B. Howe divided third, Dickey fourth.

13. Five blackbirds—Eager first, Adams second, Dean third.

14. Five clay-pigeons—Eager first, Webber second, Gilman and Rice divided third, McDonald third.

MILFORD, Mass., July 28.—At the recent meet of the Milford Sportsman's Club at their range the events and individual scores were as follows:

First event, 5 glass balls—Howe, Wales 5, Wilkinson, Fletcher 4, Connors, Manchester, Newell, Hancock 3.

Second, 5 pigeons—Howe, Newell, Wilkinson, Manchester 4, Conners, Fletcher, Wilkinson 3, Hancock, Bass 2.

Third, 5 pigeons—Howe 5, Wales, Manchester 4, Newell, Fletcher, Wilkinson 3, Connors, Bass 2.

Fourth, 7 balls—Conners, Fletcher 6, Howe, Newell, Hancock 5, Bass, Wilkinson, Manchester, Wales 4.

Fifth, 5 pigeons—Rowe, Wales 4, Joslyn, Conners, Newell, Manchester, Fletcher, Wilkinson 3.

Sixth, 6 balls—Wilkinson 5, Howe, Conners, Fletcher, Manchester, Hancock 4, Wales, Newell, Joslyn 3.

Seventh, 5 pigeons—Wilkinson 5, Wales 4, Connors, Fletcher, Howe, Manchester 3.

Eighth, 5 glass balls—Wales 5, Howe, Wilkinson 4, Fletcher, Newell 3, Conners 2.

Ninth, balls—Wales, Fletcher 4, Howe, Wilkinson 3, Conners, Manchester 2.

Tenth, balls—Wales, Fletcher, Conners, Manchester 4, Wilkinson, Howe 3.

THE MACON TOURNAMENT.—The tournament of the National Gun Association, Ocmulgee Division, will be held at Augusta, Ga., Aug. 10–12. The association has arranged a very enticing programme for their inter-State tournament, and has complimented Macon with an offer of the tournament. It has been accepted, and every effort will be made to render the occasion one of the most successful that has ever transpired here. In addition to the regular programme, other features of a pleasant nature will be added, and the event made one of general interest and enjoyment. A large crowd will be here to witness the sport. Over three hundred invitations have been issued to organized gun clubs in different parts, and it is expected that a large portion of them will be present to participate in the exercises. Their families and friends will come with them, and the crowd will be a large one. To induce visitors to the city during the tournament, the management has secured excursion rates from all the railroads leading into the city. The Central and its connections will sell tickets at one fare for the round trip upon presenting a certificate signed by Judge Mr. R. Freeman, and all gun clubs will be passed at two cents per mile one way for the round trip. These rates will bring the people to the city, and a general good time is in store for all who come. The Lanier House will be headquarters. The following citizens' reception committee has been appointed: Mayor S. B. Price, Aldermen G. C. Conner, W. R. Cox, W. A. Davis, A. Proudfit and Messrs. Thomas Hardeman, James H. Blount, George B. Turpin, B. C. Smith, J. H. Campbell, C. L. O'Gorman, W. A. Huff, H. Horne, W. H. Ross, S. R. Jaques, J. R. Hertz, N. Winship, Felix Corput, T. B. Gresham, J. S. Baxter, Morrison Rogers, F. J. Cline and W. A. Doody. The young men's reception committee has been named as follows: W. H. Woodson, Reff Sims, A. R. Freeman, Clarence Cubbedge, O. G. Sparks, Jr., C. D. Pearson, Joe G. Blount, Saulsbury, S. H. Pearson, S. A. Reid, Stewart Jones, Tracy Baxter, Asher Ayres, W. H. Felton and Ed. L. Brown. It is requested that both committees named above meet to morrow morning at 11 o'clock at the court house, for the purpose of deciding among themselves what progamme will be mapped out for the entertainment of the visitors. It is hoped that the meeting will be a full one, as Macon should exhibit in proper style the appreciation of the compliment with which she has been tendered.

THE NATIONAL GUN ASSOCIATION.—Cincinnati, O., July 31.—*Editor Forest and Stream:* At a meeting of the Board of Directors of the National Gun Association, held July 30, 1885, Judge Matt. R. Freeman, of Macon, Ga., was duly elected a director of the National Association, vice John Eyer, of Newport, Ky., resigned.—F. C. BISHOP, Secretary.

THE NATIONAL GUN ASSOCIATION.—Cincinnati, O., Following is Capt. West's reply to the open letter of Mr. Bloom: "St. Louis, Aug. 2. MR. J. B. BLOOM, Cincinnati, O. Dear Sir: Yours of July 25 to hand and contents carefully noted. We think your suggestions good, and will place the same before our committee for consideration. Many thanks for mailing our postals. We invite all clubs in the States not named to send delegates, with the view of organizing a National Sportsmen's Association, for the purpose named in our circular. Would like you to mail me a copy of your constitution and by laws. Hoping to have a large representation from your State, Yours respectfully, H. C. WEST."

BLACKBIRDS FOR TRAP-SHOOTING.—At the St. Louis, Mo., convention of Sept. 25, it is proposed to substitute live blackbirds for live pigeons in trap-shooting.

NATIONAL GUN ASSOCIATION TOURNAMENTS.—Special Notice.—Members desirous of organizing tournaments in their vicinity, under the auspices of the Association, are requested to notify the undersigned. All the expenses of the same will be paid by us. Make your arrangements for 1886. We propose to establish a circuit of tournaments annually. Claim your dates now.—F. C. BISHOP, Secretary, Box 1292, Cincinnati, O. Send 10 cents for hand book containing rules, constitution, etc. "Fairly started and its future depends entirely upon the manner in which the sportsmen throughout the country respond."—C. M. STARK, April 18, 1885.—*Adv.*

FIXTURES.

July 24 to Aug. 8—A. C. A. Meet, Grindstone Island.

AMERICAN CANOE ASSOCIATION.

SECRETARY—C. A. Neidé, Schuylerville, N. Y. Candidates for membership must forward their names, with $2 for initiation fee and first year's dues, to the secretary, who will present the names to the executive committee. Money should be sent by *registered letter* or money order.

THE ASSOCIATION MEET.

A. C. A. Camp,
Grindstone Island, July 28, 1885.

LIFE at Grindstone Island goes on quietly throughout the year, one week differing from another only as the seasons vary from a bleak and inhospitable winter, with deep snows and heavy ice, to a warm and verdant summer, with seasons of intense heat. For fifty weeks of every year there is little to disturb its quiet monotony, but for the remaining two the scene changes only to drop back again into deeper quiet and solitude. During this short period everything is changed, the grove and hillside are gay with tents and banners, along the beaches are ranged rows of shapely little huts, the river is marked out with gay flags showing the courses, and dotted with hundreds of small craft, and the presiding genius of peace and quiet seeks refuge elsewhere from the unending din; the hum of voices, the daily calls of the cannon and the shrill whistle of the steamers.

The expediency of holding two camps in succession in the same place has been often questioned, as some men wish to visit a new spot each year; but there is no doubt that the choice of this point for the present year was a wise one. Not only is the location a desirable one in every way, and more central for the present than any other point, but last year much hard work and money were expended in preparation; while this season the labor and cost has been very small. Some men will be absent who would have visited a new spot, but many old faces are seen everywhere, with some who have never been here before.

The question of location is one that the Association is required each year to solve, and there are two important sides to it. On the one hand many desire a new camp each year, as their vacation is but short and they do not care to revisit the same place, while on the other hand, with a good site once chosen and prepared, the expenses are very much less, and each year more perfect arrangements are possible. The selection and preparation of a camp involves a great deal of work, and the expenditure of both time and money by men who expect and receive no compensation, and their labors are materially lessened when a camp is visited the second time. The first week in camp is usually spent in short cruises, and of course the same locality becomes monotonous, but this objection might be overcome by a cruise of a week before or after visiting the camp, a stay of several days being made there during the races. Those familiar with the St. Lawrence can easily, after the races, reach the head of some stream by rail from Clayton, and cruise home. The question of location will soon have to be considered for next year, and it is the intention of the executive to decide it according to the wishes of the majority. This season the Association has had the benefit of Com. Oliver's military experience and the results are everywhere apparent in the increased order and discipline of the camp.

One great nuisance of last year has been entirely prevented through his precautions, the presence of strangers in camp. Last season no measures were taken to prevent the landing of strangers, and all the steamers in the vicinity carried excursions to the camp, landing crowds of people each day in the midst of the canoeists. No privacy was possible at any hour, and both business and racing were greatly impeded. This year Com. Oliver caused to be sent out to all steamers, hotels and depots in the region a notice that the A. C. A. camp was private ground and that no parties would be allowed to land except on one day of each week. Friends of the canoeists are admitted between 9 A. M. and 5 P. M. each day. On landing they are furnished with badges by the secretary or officer of the day. Large signs are posted about the camp, "A. C. A. Camp, private grounds, for permission to land apply to secretary." These precautions have kept away the crowds that were so annoying last year, while canoeists are at liberty to receive their friends. On Thursday the camp is open to all visitors from 9 to 5. The following rules have been printed and a copy is furnished to each canoeist on reporting:

A. C. A. CAMP RULES.

I. For the better enforcement of rules and regulations, a member of the Executive Committee will be detailed daily to act as Executive Officer of the Day. He will be obeyed and respected accordingly.

Club commanders will detail daily one member to act as camp police, the duty of whom shall be to see that the rules are complied with. All camp police will be under the immediate direction of the Officer of the Day, and will apply to him for badges, which must be worn conspicuously during the tour of duty.

II. Flags will be raised at 8 A. M., and lowered at sunset. After 10 P. M. a reasonable amount of quiet must be observed in camp.

III. Daily, before 10 A. M., tents must be put in order and grounds policed; all refuse, etc., from cooking gathered for removal by the police cart. Clubs and members will provide themselves with the necessary boxes or pails for this purpose.

IV. Visitors (invited guests wearing badges excepted) will not be permitted in camp except on Thursdays, and on special occasions posted on the bulletin board.

V. Invited guests may obtain badges from members, or at the dock, and must wear the same conspicuously while in camp.

VI. Visiting boats must land and be moored at the dock, unless otherwise directed by the Officer of the Day.

VII. Camp will be open daily to invited guests; but ladies will not be expected in camp before 9 A. M., or after 5 P. M., except by official invitation for special occasions, which will be posted on the bulletin board.

VIII. Cleanliness and good order are indispensable for the general health and comfort, and the Commodore trusts that all members will cheerfully comply with the few simple rules required. The Officer of the Day, club commanders and the camp police are charged with the responsibility for the observance of these regulations.

GENERAL INSTRUCTIONS.

I. Members may obtain badges for invited guests from the Secretary and Officer of the Day.

II. The Secretary will be at his tent for the transaction of business daily, from 9 to 10 A. M.

III. Members desiring board at Delaney's will report the fact to the Secretary or Officer of the Day on their arrival. Board, $1 per day; board and lodging $1.50 per day. Breakfast, 7 to 8:30; dinner, 12 to 1:30; supper, 5 to 7:30.

IV. There will be no bar at the camp store. Supplies of all kinds may be obtained there, including ice, milk and meat, when ordered. Postage stamps also on sale. Wood for cooking may be had from the cord wood piles. Members are requested not to use this wood except for that purpose.

V. Mails will be received and delivered twice a day at the A. C. A. tent.

VI. Steamer Magic will run between Clayton and Camp daily (Sunday excepted), touching at Round Island Park, Thousand Island Park and Grenell Island (by signal) as follows: Leave Clayton, 8:30, 10:30 A. M., 1, 3:30 and 7 P. M. Leave Camp, 9:30, 11:30 A. M., 2:30, 5 and 8 P. M.

Canadian members can come from and go to Gananoque by steamer Deseronto, which leaves there for camp daily (Sundays excepted) at 5, 8:15 A. M. and 4 P. M.

VII. All hours and rules heretofore published which may conflict with the foregoing are hereby amended.

Robert Shaw Oliver, Commodore A. C. A.

The preparations for the camp were all made in advance and everything was ready in good time. The programme was published some months since and all information concerning rules and regulations has been disseminated as widely as possible among canoeists outside of, as well as in the Association.

The first to arrive on the ground was Mr. J. F. Newman, of the Brooklyn Canoe and Sailing Club, who went into camp on July 21 and at once set about preparing the quarters and floats of the Brooklyn and Newburg clubs. On Friday Dr. Neidé arrived from Ballast Island, and on Saturday the Mohicans came in and pitched their tents. On Saturday a number of canoeists came into camp and one or two parties arrived at Squaw Point. A round of the camp this morning disclosed a total of 86 persons in camp, including Squaw Point, with 66 tents and 67 canoes. The clubs represented are the Oswego, Brooklyn, Knickerbocker, Newburgh, Hub, Ottawa, Berkeley, Rochester, St Lawrence, Harvard Springfield, New York, Mohican, Kingston, Pittsburgh, Essex, Dubuque, Brockville, Peterboro and Lake St. Louis.

The central point of the camp is Capitol Hill, a knoll rising some 50ft. above the water just at the northeast corner of the island, overlooking Ell Bay. Here are pitched the four tents of Com. Oliver, Vice-Com. Rathbun, Rear-Com. Andrews and Secretary Neidé, each surmounted by an official flag, that of the Secretary being white with the letters A. C. A. and a quill pen in blue. In front of the tents is a miniature field piece which is fired at "colors" (8 A. M. and sunset). From the hill a beautiful view may be had, the river and islands, the lower camp, gay with colored tents, flags and streamers, and beyond in a little grove, the tents of Squaw Point. This is the central point of the camp, just below it is the little dock, and near by, at the foot of the hill is the store, the A. C. A. tent and post office, and Mr. Rushton's large tent.

All canoe builders were invited this year to visit the camp and make an exhibition of their goods, but only Mr. Rushton has accepted the invitation. His tent is fitted with a work bench and a large supply of fittings, while a competent man is in charge, ready to do any kind of repair work. While it will benefit the enterprising builder, it is at the same time a great convenience to the canoeists present.

The pleasantest portion of the camp is the north shore, or rather that part running S. W. from the point. A low bluff runs along the river and from it rises a gentle incline covered with grass and trees, making a pleasant camping ground; but for some reason few of the tents are pitched here, most preferring the other shore. Here, however, is the "Nessmuk' shelter" of the Hub C. C., the tent of Mr. Ruff, Dubuque C. C., and further along the neat and picturesque encampment of the Newburg and Brooklyn clubs. The former have three tents and cook for themselves, a mess table being built by the tents. The club have devised a very convenient plan for carrying their canoes by rail. A framework is made somewhat similar to a section of an ordinary clothes horse, two uprights, each 5ft. long and placed 2ft. apart, being connected by three crossbars, each 2ft. long. One crossbar is nailed 2in. from the ground, one 6in. below the top, and one midway between these, the whole making a short, broad section of a ladder. Each upright is fitted with a wide foot, keeping the whole frame vertical. Two of these racks are placed on the floor of a car and on them four canoes can be carried without damage. The Brooklyn camp is the most complete on the grounds, the tents being large and fitted with board floors. Beyond them is the tent of Mr. Orange Frazer, then the Oswego C. C., and beyond some canoeists from Peterboro. A quarter of a mile further on is the Delaney farmhouse, where many canoeists take their meals.

Going back to Capitol Hill, to the south from the point the shore runs along in an irregular line, there being, immediately below the hill, a deep depression with low banks, where most of the canoeists are camped, their boats being drawn up on rocks along the shore. Harvard has a large tent, Springfield comes next and then half a dozen square marquees of peculiar color with the flag of the turtles in front. Below is a large tent with several smaller ones attached, belonging to a party from the Royal Military College at Kingston, in charge of genial Major Fairclough. Marmalade Lodge is represented by a small wall tent, and below are two groups, the Pittsburgh and Knickerbocker clubs, with Brockville, Ottawa and the newly-formed Essex C. C., of Newark, N. J. Each party has its own landing, and in a line in front of each tent are high flag poles, with national, club, A. C. A., private, prize and other flags displayed, for the time at half mast.

Squaw Point is larger than last year, and no less popular. Three times each day the tide ebbs and flows about the northeast point of the island in different directions, and it is interesting to sit on Capitol Hill and watch the scene. About 7:30 A. M. the fleet, open and decked, single and double blade, under sail or paddle, one, two, or three in a canoe, set out for Delaney's for breakfast and back, after which all are headed for Squaw Point, returning at noon with assorted cargoes, bound again for Delaney's and back, only to make the same trip at evening. Many walk across, and the spectator who climbs the big hill is repaid by an enlarged view; canoes and boats of all kinds over the waters as far as can be seen, while on shore are passing and repassing a restless procession to and from Delaney's, Squaw Point and the main camp.

The year a new idea has been put into use, nearly every mainsail has its owner's number on the official list, stenciled in large figures on the sides, so that a canoe can be recognized at a long distance, while the effect is not displeasing. Not only is it convenient in racing but its usefulness extends still further. Seated in front of his tent, with a fairly good glass, the officer of the day can tell at a glance the whereabouts of all hands. The practical value of this plan is easily demonstrated by a look through the glass as we sit in front of the Commodore's tent. Sweeping the horizon to the north, is a sail with the figures 624, under which two hats, a white helmet and a black straw, with several feathers, show that Harvard's conquests afloat are not confined to New London waters and racing eights. Further south, in charge of an open Canadian canoe propelled by two ladies, the numbers 618, 626 and 265 show that Albany, for the time being, has other matters in hand than devising new sails or cleats. Still further on, drawn up on the sandy beach at Squaw Point, are a fleet of canoes of all models; against the shining white of the sails the numbers 14 and 207 in red stand out as conclusive evidence that the secretary's "office hours" are over, and that "in the absence of the commodore" the vice is in charge of the main camp.

During this week there are no regular events on the programme; some ride about camp and do nothing, many are busy rigging or practicing for next week, and others make short cruises of a day or so among the surrounding islands. The day begins with a cruise early in the morning, then a tramp or a paddle to the farm for breakfast, afterward an hour or so of camp work, varied by a run down to the dock to meet the boat and to greet the new arrivals, then a call at the post-office for letters and papers. Some drift off to Squaw Point, some start off very early for a cruise, and some amuse themselves with a sail until dinner. In the afternoon the same programme is repeated, and in the evening a camp-fire is held, or if nothing else is on foot all go out paddling. Somehow, without excitement, there is not too much monotony, the days pass quickly and pleasantly to all. A number cook for themselves, while several parties have paid cooks.

THURSDAY, JULY 30.

This season will probably see an important change in the organization of the Association and the formation of a Western branch. The first idea of the original founders of the American Canoe Association was to make it a national body, with members in all parts of the Union as well as Canada, and this idea has been prominent in the selection of officers. The flag officers have each year numbered one Western man, and special attention has been accorded in the meetings to such Western members as have chosen to attend, but thus far the membership west of Pittsburgh is less than one hundred men, though many canoeists in the West. One reason for this has been that the annual meet, in order to be accessible to the large majority of the members, has been held at places too far distant for the Western men, and they would not join unless able to attend. The meet is of course the most prominent feature of the Association, but it is really the least important of the advantages conferred on all canoeists by the A. C. A. The many improvements in canoes, sails and fittings, the general recognition of canoeing as a prominent and legitimate sport, both by the press and the public, the large and rapidly increasing literature of canoeing, the improved facilities for transportation, and the general exchange of cruising information among canoeists, all date directly from the formation of the Association at Lake George in 1880, and to that alone is due the great difference between canoeing in 1885 and canoeing in 1875. These benefits are none of them confined to A. C. A. members; the isolated canoeist in Maine or Michigan also can learn at the expense of a few dimes just what more experienced canoeists are doing, and can make his sail like theirs, instead of wasting time and money in learning for himself, owes a debt directly to the Association, but ask him to pay a dollar a year to its support, or to give the benefit of his experience in return, and he at once falls back on the assertion that the meet is too far distant for him to attend.

The question of extending the Association so as to interest the Western canoeists has for some time engaged the attention of the leading members, and this year it has been brought into special prominence through the action of some Western canoeists in organizing a meet at Ballast Island, with the idea of effecting some permanent organization. A scheme was proposed this spring by Com. Oliver for the extension of the Association by means of a Western branch, and was published at the time in the Forest and Stream. The canoeists here have awaited with some interest the result of the Ballast Island meet, an account of which was published in our last issue. On the arrival of Mr. W. P. Stephens, the only canoeist from Ballast who will be present here, a meeting of the executive committee was held to hear his report. Although Mr. Stephens is not a Western man, but from New York, he was appointed a representative to the A. C. A., as no Western man was able to visit Grindstone. Mr. Stephens presented to the executive committee the following letter:

"Western A. C. C., Camp Gardner, Ballast Island, Lake Erie, July 24, 1885.—The following was duly adopted at a meeting held this day:

"*Whereas*, The Western A. C. A. has been duly organized on the 24th day of July, A. D. 1885, at Ballast Island, Lake Erie; and,

"*Whereas*, The said association is desirous of encouraging canoeing in this country, and organizing rules, regulations, etc., that may govern the canoers throughout North America; therefore, be it

"*Resolved*, That a representative be elected from this Association with instructions to present the action taken at this meeting to the A. C. A. at its meeting at Grindstone Island, and that the said representative express to the said A. C. A. our willingness to reorganize the said A. C. A. on a basis which will place this Association on an equal footing with such an organization as may be formed by Eastern and Canadian canoers. (Signed) W. H. Eckman, Sec'y W. A. C. A.

Secretary Neidé, who had also visited the Ballast Island camp, was called on for his opinion, and both he and Mr. Stephens reported on the meet. The Executive Committee were unanimous as to the propriety of some action in regard to a Western branch, but the general opinion was that the meeting at Ballast Island, from its small numbers and the few A. C. A. men present, could not at once be accepted as a representative of the Western canoeists or of the Western members of the A. C. A. It is probable that a scheme for the extension of the Association at the will of the Executive Committee at any time will be adopted, and the question will be put to every A. C. A. member whether he is willing to accept the action of the Ballast Island meet. Objections have already been made by some Western members to any real diversion of the Association, and while it is desired by all to provide a meet nearer home for them, it is considered but fair to consider their wishes as to the methods.

Wednesday passed very quietly, the day ending with an excursion to Alexandria Bay on the steamer Ontario, accompanied by the Gananoque band. To-day a number of canoeists arrived from various points and the spaces between the tents are rapidly filling up. In the evening a large camp-fire was lighted on the hill, the delegates at Squaw Point being present in full force, besides a party from the Thousand Island Park. A party of canoeists went up to Brockville during the day to see a lacrosse match, returning at evening. The weather is very warm with little wind. Yesterday passed quietly with little to note except a scrub race for any canoes in the afternoon. Some excitement was occasioned on Thursday at midnight by a fire in camp. A canoeist who slept on shore in his canoe was using a candle during the evening, blowing it out finally. Some time later his canoe tent was found to be on fire and was partly destroyed before help arrived. The officer of the day headed the fire department who gallantly extinguished the flames. Mr. J. L. Weller, of Peterboro, has left the camp after a few days' stay and will not be here for the races. He has only been home from the Northwest, where he was on Gen. Laurie's staff, and consequently is unable to spend much time here.

At 3:30 P. M. yesterday a scrub sailing race was started, twice over the course, or 3 miles. The entries were:

Katrina	R. W. Bailey, Pittsburgh C. C.
Thetis	P. M. Wackerhagen, Mohican C. C.
Sea Bee	C. B. Vaux, New York C. C.
Germaine	A. G. Webster, Harvard C. C.
Sofronia	F. F. Andrews, Rochester C. C.
Startle	G. G. Hutchinson, Brockville C. C.
Daisy	G. O. Totten, Essex C. C.
Freyja	C. F. Holdship, Pittsburgh C. C.
Nereid	Henry Shafer, Essex C. C.
Beatrice	Theo. Dunham, Harvard C. C.

The wind was fresh from N.E., making a run on first and third legs and a dead beat on the second. Commodore Oliver started the race with a blast from a horn at 3:29 and a big firecracker at 3:30, Katrina going over first, with Sea Bee close by her, the rest well bunched, none being handicapped. On the first leg a steamer ran to windward of most of the boats, stopping them, but Sea Bee lay close enough to weather the steamer and hold her way, leading around the mark, with Katrina, Thetis, Sofronia, Germaine, Startle, Daisy and the others in order. Once around, Sea Bee stood to the west on starboard tack, working short tacks, while Katrina and the others held the port tack until up to windward of the buoy. Katrina led again at second mark, with Sofronia second, Thetis third and Sea Bee fourth. The wind was fresh as the fleet came down to the start, Katrina still far ahead, with Thetis and Sofronia near together. The times at the end of first round were:

Katrina	3 54 00	Sea Bee	3 55 45
Thetis	3 54 15	Startle	3 56 00
Sofronia	3 54 20	Daisy	3 56 30
Germaine	3 55 40		

The leaders jibed neatly, but Startle nearly upset. Over the first leg again the order was nearly the same, but Sea Bee passed Germaine, taking fourth place. On the wind again Sea Bee stood off on starboard tack as before, Sofronia following, the others keeping to the east, the better course, as it proved. Katrina was around first, then Thetis, Sea Bee, Sofronia and Germaine. Katrina quickly ran down the last leg winning easily. As the Sofronia was close to the buoy the steamer Deseronto ran through the fleet, so close to her as to nearly upset her and cutting her off from the buoy. Before she recovered both Germaine and Startle had overtaken her. The times were:

	Finish.	Elapsed.		Finish.	Elapsed.
Katrina	4 19 00	49 00	Sea Bee	4 20 50	50 50
Thetis	4 20 00	50 00	Germaine	4 24 50	54 50

Sofronia, Startle and others not timed. This is the first race over the new course, which is laid further out than last year, and the first race in which most of the sails were numbered. Captain Gibson has brought with him a set of large stencils, and men are busy all the time numbering their sails.

Last evening the steam yacht Marquis of Lorne brought up a party from Kingston, this morning the yawl Molly, T. P. Mallock, of Hamilton, was anchored off the camp, to-day the Lucile, Mr. Chas. Kellogg, and the Calomet, of New York, called here, and the Idle Hour, steam yacht, is a frequent visitor. Just now, 4 P. M., seven yachts of the Gananoque Y. C. have just come in. Early this morning rain fell for several hours, cooling the air, but at 10 A. M. all was clear again. To-night all the camp goes to a hop at Thousand Island Park.

MONDAY, Aug. 3.

On Saturday evening many of the canoeists attended the hop at Round Island, returning on the steamer Magic. The ladies from Squaw Point accompanied the expedition. One cavalier, returning from the Point after escorting them home, found that in his absence his comrades had chased and captured a young calf, which was snugly esconced in his bed.

Sunday was clear and bright, but a strong N. E. wind sprang up during the night, sending in quite a sea on the beach, with whitecaps all over the river. Only half a dozen ventured out in the morning, four of them to try a sail together over the course. At 11 A. M., all were summoned to the slope of Capitol Hill, where the secretary's rustic desk had been placed under a tree and draped with an American flag. Here the service of the Episcopal Church was read by the Rev. Dr. Lasana, of the Berkeley C. C. A large congregation were gathered on the hillside and joined in the services, which included the prayers for the Queen and royal family, as well as for the President of the United States. The afternoon and evening passed very quietly, a couple of hours being spent around a camp-fire in quiet conversation and all turning in early. This morning was cloudy with a high wind, but the first race was called according to programme, being Class III., paddling, 1 mile:

Hillcrest	Edwin Gould, Knickerbocker C. C.
Invincible	M. F. Johnson, Toronto C. C.
Beatrice	Theo. Dunham, Harvard C. C.

There was a strong wind across the course and some sea. The first two canoes were open Canadian, while Mr. Dunham had a heavy-decked Racine. Mr. Gould took the lead but upset almost at the start. Mr. Johnson led over the course, winning easily. The start was made at 9:37, finishing at 9:52:30, or 15m. 30s. time. As the race was started rain began to fall and continued steadily, so the other races were postponed. The meeting will be held this evening.

MOHICAN C. C.—The long distance race of the Mohicans, four miles to windward and return, for the prize presented by Captain Thatcher, was sailed July 21. The prize was a very handsome Bohemian-glass beer set, consisting of six goblets and a pitcher, handpainted, and all standing on a brass tray appropriately inscribed. There were three entries, Thetis, P. M. Wackerhagen; Snake, R. W. Gibson; Annie O., H. L. Thomas. The race was sailed in a light breeze, and all the boats kept within hailing distance, taking much the same course. After the turn the Thetis drew ahead and came home the winner in 2h. 20m., with the Snake 7m. later. The Annie O. was caught on a sandbar and filled by the swells from the day boat just coming into Albany and her time not taken. The prize is the most valuable in the gift of the club, and once won is held by the winner.

PROFESSIONAL CANOE PADDLING.—Owahgena Reading Room, Cazenovia, July 25.—*Editor Forest and Stream:* It is many a year since I have written to or for Forest and Stream, a journal that now graces this boat house reading room; but I must send my warm approval of the tone of "Professional Canoe Paddling." All the manly sports are being degraded to money making and gambling with no end of doubtful method, and our young men must suffer in tone and idea. I am glad to see your purpose so high.—L. W. L.

SHERBROOKE B. AND C. C.—The officers are: President, Col. Gustavus Lucke; First and Second Vice-Presidents, F. P. Buck and L. E. Paunctor; Commodore, Jas. F. Morkill; Secretary, John H. Walsh; Treasurer, W. D. Fraser. Committee of Management: Jos. G. Walton, Chairman; H. W. Mulvena, H. R. Fraser, Alex. T. Winter, Jno. Ready, H. Hains, Chas. H. Foss.

ESSEX C. and B. C.—The following officers have been elected: Commodore, Geo. O. Totten; Vice-Commodore, Geo. Cox; Secretary, W. Scott; Purser, W. H. Hillier. The signal of the club is a double pointed burgee, blue ground with red border and the name Essex in white.

Yachting.

Sept. 19—Pentucket Y. C., Union Regatta.
Sept. 28—Pentucket Y. C., Championship Regatta.

THE "HERALD" STEAM YACHTS.

ONE of the two yachts, which were commenced over a year since, by Lawley & Son, of South Boston, is now entirely completed, and on the ways ready for use as soon as launched. These two yachts, built under the supervision of Mr. Edward Burgess, from designs by Mr. Beavor Webb, differ greatly from the boats of their size built here, and will attract no little attention when they come to New York. They are intended for use about New York Bay in all weathers, collecting shipping news, consequently they are in model very staunch and able boats. The dimensions of each are: Length over all, 57ft.; waterline, 50ft.; beam, 9.2ft.; moulded depth, 7.3ft.; draft, 4ft. 6in. Both of the boats have plumb stems, high freeboard with a rather straight but handsome sheer, a very long counter, running out to a fine edge at the taffrail, and a full midship section, in contrast to the low-sided, high-stern boats commonly called steam yachts here. Below there is a cabin 10ft. long in the bow, very neatly fitted with cherry. At its forward end is a w. c., and there are lockers on the sides and closets. A ladder aft gives access by a small square companion to the deck, or rather to a deep cockpit, aft. square, just abaft the cabin, A length of 17ft. just aft of this is devoted to engines and boilers, aft of which again is a second cabin, 7ft. long, plainly but neatly finished, while still further aft is another deep cockpit. Over the engine space and after-cabin is a trunk about 10in. high with circular deadlights in the sides. Over both cabins are skylights, and between the boiler and engines is a hatch and ladder to the fireroom.

In construction the yachts are far ahead of the usual American practice, as will be seen from the following specifications: The stem, sternpost and deadwoods are of oak, sided 4in., the stem moulded 12in. and the sternpost 17in., all being fastened with ⅜in. yellow metal bolts. The keel and keelson are of Canada rock elm, the former sided 4in. and moulded 6in., the latter moulded 9in. The frames are of steamed elm, sided 3in., moulded 1¼in., spaced 15in. centers. The clamps are 6×2in., and the shelves are 4×3 red pine, with stringers 8×3 under the floor beams. The floor knees are of angle steel, 1¼×1¼×⅛in. The inside bilge strakes are 7×1in., well riveted to the frames. The planking is of Honduras mahogany, ⅝in. thick and about 6in. wide, in two thicknesses. The inner skin is laid diagonally and fastened to the frames, then it is coated with marine glue, over which canvas is laid and ironed down smooth, embedding it firmly in the glue. After another coat of glue on the canvas the outer skin is laid on, running fore and aft. Both skins are riveted to the frames with ⅛in. rivets, and also riveted together between the frames. The deck beams are of oak, 3½in. sided and 3in. moulded at centers, tapering at the ends. The planksheer is of teak, 7×¾in., with yellow metal fastenings to clamps and deck beams. The deck is white pine, 2⅜×1¼in., the seams payed with marine glue. All the skylights, coamings, house and hatches are of teak, making a very handsome finish, being all varnished.

The engine is one of Willan's compound, three low pressure cylinders ranged fore and aft below, with three high pressure above them. Two levers are provided, one for starting, stopping and reversing, and one above for running ahead compound, astern compound, or as a simple engine only. To port alongside the engine is the condenser, a brass cylinder 4ft. long and about 20in. diameter, lying in the bilge. The governor and blower are both run from the main engine by steel belts, about 1-16in. thick and 1½in. wide. The boiler is a horizontal tubular, built in this country. The screw is of gun metal, double-bladed. The rudder stock is of oak, head 4⅜in. diameter, with backing of yellow pine. The shoe is of gun metal. The second yacht Telegram is also finished except her engines and boilers.

TORONTO.

FOR water sports of all kinds, from yacht sailing down to shell rowing, there is probably no place along the Atlantic coast or the lakes that offers such excellent facilities as Toronto. Situated directly on Lake Ontario, with deep water all around, the island opposite the city incloses a small portion of the lake, making a harbor for small craft of all kinds. Along the water front are long rows of boat houses two stories high, each divided up into a number of small rooms which are let by the year to private parties. Each room is about 20ft. long and 12ft. wide, with racks for one or two boats, oars and sails. Upstairs is a similar room, used for dressing and in some cases fitted up for living in during the summer. The lower rooms all open on a platform about 15ft. wide and running the entire length of the building, sloping to the water's edge. On the platform the boats are rigged up before launching. A part of one of these houses is occupied by the new Toronto Skiff Sailing Club. The space over the boat rooms makes a large meeting room with balconies around, and a flat platform in the roof, from which a fine view of the lake can be had. The club was only formed this spring, but has already a membership of nearly 100. They hold races on the bay nearly every Saturday. The skiffs are mostly double-ended boats of 16 to 18ft. length, fitted for rowing and sailing, many of them handsomely carpeted and cushioned. On holidays and of evenings the bay is covered with them. Besides the skiffs there are a number of shell boats in the Argonauts and the Toronto Rowing Club, and in the home of Hanlan shell rowing is probably more popular to-day than anywhere else in America.

The Toronto C. C. has been known for some years as the leading Canadian club using decked canoes. They now have a comfortable club-house near the shop of Mr. Glendenning, who built most of their boats. The club use mostly canoes of the Pearl type, with heavy centerboards, their sailing being done on the Bay in all weathers. Several of the latter boats, such as the Sapphire and Evora, depart somewhat from the Pearl model, in having finer lines and less beam, and are generally lighter in build, while retaining the heavy boards. The sails carried are mainly balance lugs.

On the city front is also the house of the Toronto Y. C., built this year, a large two-story building with meeting rooms, dressing and bath rooms upstairs, and a boat room below for members' boats. The club worked hard this year to secure suitable quarters, in which they have been very successful, and now that they are well housed, with good facilities both for yachting and boating, they expect an increased membership. They also own a site on the island where a house may ultimately be built. Near the house part of the fleet is anchored, among them the old cutter River, an iron boat built twenty-five years since in Scotland, and still in good condition.

Toronto Bay is a sheet of water about 2 miles long by 1¼ wide, of oval shape, separated from Lake Ontario by a low tongue of land and sweeping from below the city on the east across to the west, where there is a narrow opening into the lake. On the eastern side is also an opening with about 5ft. of water, through which, with an east wind, a sea rolls in from across the lake, making rough sailing on the bay, but in ordinary weather the island is sufficient protection and the water inside is smooth, while the wind has a full sweep, making good sailing. On the west end of the island is Hanlan's Point, named after the famous oarsman, who e his brother has a hotel and boat house. Near by are booths and tents with shows of all kinds. Beyond there is a long stretch of grass and sand on which a number of tents are pitched in which people from the city live during the summer. Some of the tents are fitted up quite elaborately, being divided into several rooms with board floors and well furnished. In a large tent of this kind is camped a member of the Toronto C. C. with his family, while his canoe is moored at the rear door of the tent. This part of the island makes a very fine camp ground, as there is little water inside and Lake Ontario just outside, while the city is easily reached for supplies.

Further on to the east is the headquarters and club house of the Royal Canadian Y. C., the house, a large and handsome structure, being surrounded by neatly laid out grounds diked in, while near by is the anchorage. While the depth in places about Toronto is limited for large boats, Lake Ontario offers a large cruising ground for cutters, and promises some day to have a fine fleet. In addition to Verve and Aileen, a new 40 by Watson is now spoken of as among the probabilities. The numerous ports along the lake offer harbors for yachts of all kinds with fine water for cruising.

In Toronto, as in other places on the lake, the efforts of the Lake Y. R. A. have already wrought good results to yachting, and its influence is increasing each year. Canoeists are no less favored than yachtsmen, as they have not only a fine place for sailing and racing, but the adjacent shores of the lake afford them good camping grounds at convenient intervals, while a short ride by rail takes their boats to some of the chains of beautiful lakes so common in Canada. With tideless waters, clear and deep, good breezes, and through the season a mild climate, Toronto should take a leading place in all water sports.

BEVERLY Y. C.

THE morning of the 100th regatta, Monument Beach, July 22, opened calm, the only air stirring coming from N.E., and rendering it impossible for the Myth to reach the line at the advertised time. However, the others waited for her, and just as she reached the judges' yacht the wind came out light S.W., gradually increasing during the race. In the sloop class no starters appeared, in second class Mattie made a good fight for pennant, losing it by three seconds only, while Lestris had an easy time in third class. The race among the little fellows was exciting; Fannie, who used to sweep Boston Harbor a few years ago, had been brought round the cape to beat Dolly if possible, and Petrel, just built by Hanley, with the same object in view, made her trial trip.

Petrel was not in trim and did not come up to the expectations formed about her, but Fannie won easily.

	Length.	Actual.	Corrected.
SECOND CLASS.			
Surprise, cat, J. M. Codman	27.03	2 13 56	2 03 23

Courses, the usual triangular ones, eleven and seven and one-half miles. Judges, Richard Codman, W. W. Appleton, A. H. Hardy. Judges' yacht, Violet, B. Y. C.

ATLANTIC Y. C. CRUISE.

AFTER a Sunday at anchor at Norwalk Islands, the fleet was under way early on Monday morning in a light S. E. wind, bound for Thimble Islands.

Little Aria started at 9:45 with a lead of 10 minutes over the larger boats, who passed Bell Island Point in the following order: Fanita, 10:05:30; Athlon, 10:05:35; Daphne, 10:05:38; Rover, 10:07:01; Thistle, 10:07:04; Roamer, 10:07:06; Wivern, 10:07:32; Agnes, 10:08:10; Decoy, 10:08:56; Santapogue 10:08:57; Leona, 10:09:58; Haze, 10:09:59; Concord, 10:11:38. Stella joined the fleet beyond the harbor, and a little later, at 10:30, the order was Fanita, Roamer, Stella, Athlon, Daphne, Thistle, Agnes, Rover, Decoy, Aria, Wivern, Santapogue, Haze, Leona, Concord. Part of the fleet tacked on and off under the Connecticut shore, but Agnes, Athlon, Leona and Santapogue held on until 11:30, by which time they were close to Long Island, when all went on starboard tack.

At 1 P. M. Daphne left the fleet for New York. For a time a light breeze favored them, but at length it fell, and left them to drift for a long time in the hot sun with a foul tide. When the breeze did come again it was from N. E., leaving the four to leeward, but later in the afternoon it shifted to S. E. again, favoring them and putting Agnes and Athlon ahead. So much time had been lost, that at 6 P. M. it was decided to put into Morris Cove, and the signal was given accordingly. Agnes and Athlon made a close race of it for first place, but the others nearer to Connecticut were too far ahead. The times of arrival were: Fanita, 7:02:05; Roamer, 7:10:15; Thistle, 7:37:20; Haze, 7:42:27; Rover, 7:44:30; Viola, 7:48:00; Stella, 7:53:30; Athlon, 8:20:00; Agnes, 8:10:30. The Sylph came in during the evening and anchored with the fleet.

Tuesday opened with a dense fog, but the sun and a fresh south wind drove it away. Fanita and Sylph left the harbor at 9 A. M., the former going to the westward. Aria started first again at 9:17, with the main division at 9:27, passing New London Light as follows: Aria 9:42:31, Agnes 9:43:38, Decoy 9:44:50, Viola 9:45:08, Wivern 9:46:02, Roamer 9:47:03, Athlon 9:48:20, Thistle 9:49:03, Atalanta 9:50, Haze 9:50:10, Rover 9:50:08, Stella 9:50:09, Leona 9:51:16. At 10:30 Bradford Light was passed, and at 11 A. M. the Thimble Islands were abeam, Roamer leading the fleet, then Agnes, Thistle, Athlon, Decoy, Haze, Viola, Rover, Wivern and Aria. The wind was very light about noon, the fleet in two divisions drifting on past Faulkner's Island at 11:30, and Cornfield Lightship an hour later. Agnes was ahead here with Thistle, Roamer, Haze and Athlon near her, the others far astern. At 3:30 the flagship was abreast of New London Light, and a little later she was anchored inside. The times were: Agnes 3:44:50, Haze 3:54:15, Thistle 4:10:51, Roamer 4:18:58, Athlon 4:17:09, Stella 4:18:02, Viola 4:18:29, Decoy 4:36:10, Leona 4:40:30, Wivern and Aria 6:30. Rover came in later, not having left with the others. The Sylph arrived twenty minutes after Agnes. A heavy thunder squall came up in the evening, but what damage it did was entirely on shore. Athlon went on the railway for a cleaning, coming off early next morning. Quiet prevailed throughout the fleet in the evening, and all turned in early.

On Wednesday morning the signals from the flagship ordered a sail to Shelter Island by way of Plum Gut, and at 9:10 when the gun fired, the first boat under way was the Crocodile, which had joined the fleet in the evening. The final gun sounded at 9:18 and all started with a N.E. wind, which soon shifted to the south. Within an hour Crocodile was first boat. The breeze was very light in the Sound and it was 11 when Crocodile passed Bartlett's Reef Lightship, with Roamer, Viola, This le, Athlon, Daisy, Agnes, in order astern. Before Plum Island was reached a change had been made in the order, Roamer, in a fresher breeze, passing Crocodile and leading the fleet. The leaders, Roamer, Crocodile, Thistle, Athlon and Viola, had a little ebb to aid them, but the others met the young flood, which held them back in the light breeze. The times of arrival were: Roamer 2:23:05, Athlon 2:32:25, Thistle 2:32:50, Crocodile 2:35:50, Viola, 2:37:20, Agnes 2:39:05, Stella 3:03:45, Leona 3:20:10, Concord 3:21:33, Haze 3:21:58, Wivern 3:33:25, Decoy, Aria. In the evening most of the members visited the Prospect House.

Thursday morning saw the fleet at anchor in Deerings Bay with flags half mast on account of the death of General Grant. At a meeting on the flagship the yachtsmen decided on sailing for Stonington through Plum Gut, and at 12:45 all were off with a favorable tide and a light south wind, shifting to east and west by times. The Aria and Crocodile as usual had 10min. start. The fleet was increased by the Bertie, which joined in the sail. For some time the wind came strong sending the fleet flying along, but when off Race Rocks it lessened and the tide also hindered the yachts. The order at Race Rock Light was Crocodile, Roamer, Bertie, Agnes, Athlon, Haze, Thistle, Rover, Viola, Stella. Slowly the fleet made its way into Stonington, the times being: Crocodile 5:07:20, Roamer 5:10:15, Bertie 5:15:58, Thistle 5:16:02, Agnes 5:21:35, Rover 5:29:32, Viola 5:31:40, Haze 5:36:33, Stella 5:38:12, Concord 5:55:10, Leona 6:32:20, Wivern 6:32:44, Decoy 6:35:20, Aria, 6:33:34.

A fog hung over Stonington in the early morning, but dispersed when the sun was well up. Crocodile left the fleet, going up the Sound. Aria went away at 9:03, with the others after her at 9:12. The order at Watch Hill was Roamer, Athlon, Thistle, Bertie, Viola, Rover, Haze, Stella, Aria, Wivern, Concord, Agnes, Leona, Decoy. Agnes soon started to work up, and passed in succession Concord, Wivern, Aria, Stella, Haze and Rover, until at noon, when near Point Judith, the order was Roamer, Agnes, Athlon, Thistle, Bertie, Haze, Rover, Viola. Bertie had no spinnaker, while the rest had set theirs, and she dropped astern in consequence. At 1 P. M., Athlon took second place and then first, leaving Roamer second. The finish was exciting and the best part of the race. The times were: Athlon, 2:14:50; Roamer, 2:15:03; Thistle, 2:18:48; Agnes, 2:20:50; Haze, 2:28:30; Viola, 2:32:00; Rover, 2:33:40; Stella, 2:46:42; Bertie, 2:50:40; Leona, 3:09:28; Concord, 3:17:50; Wivern, 3:33:46; Aria, 4:00:00; Decoy, 4:08:00. Next morning the fleet disbanded and the cruise terminated. In every way it was a success, the turn out of yachts being good, and the scrub races each day being very interesting. The weather, too, was very pleasant, though more wind would have been better for the racers. The little Aria in the small class did excellently, keeping up with the fleet each day. Roamer, in new hands, is starting in to make a record and promises to add another to the smart boats of the club of 30 to 50ft., for which it is best known, while Bertie also is showing up well on her first trial in company. The success of the cruise reflects great credit on Com. Hogins and the gentlemen associated with him in its management.

NEW YORK Y. C. CRUISE.

THIS year's cruise of the New York Y. C. promises to surpass any similar event that has occurred for many years, owing to the presence with the fleet of the new sloops Puritan and Priscilla with the English cutter Genesta, and the probable trials of speed between them and the older boats. For weeks preparations have been made on all hands, and of late all the fleet have been docked and cleaned, the conditions of the Goelet Cups excluding any yacht that has been docked since the beginning of the cruise.

By evening of July 29 the greater part of the fleet was at anchor in Glen Cove, and a meeting of owners was held in the cabin of the Polynia, the following yachts being represented:

Steamers: Polynia, Vice-Commodore Douglas; Stranger, E. J. Jaffrey; Electra, E. T. Gerry.

Schooners, Dauntless, C. H. Colt; Varuna, G. H. B. Hill; Nirvana, E. M. Brown; Southern Cross, George Duryea; Montauk, John E. Broads; Estelle, I. D. Smith; Atalanta, E. H. Townsend; Clytie, A. P. Stodes; Grayling, L. A. Fish; Norna, A. J. Leith; Speranza, H. W. Collender; Water Witch, C. H. Mallory; Ruth, Henry Marquand.

Sloops: Gracie, Jos. P. Earle; Daphne, J. R. Maxwell; Domino, G. L. Haight; Mischief, J. R. Busk; Priscilla, Bennett & Douglas; Bedouin, Archibald Rogers; Regina, R. N. Ellis; Isis, A. Canfield; Ileen, A. Padelford; Vixen, Rear-Com. Lawrence.

It was decided that the fleet should sail at 4 A. M. for New London. At 5 A. M. a gun from Polynia gave the signal to prepare, and half an hour later the fleet started, the wind being light from northeast. The first away was Vixen, followed by Priscilla, the latter soon taking a head and keeping it all day. Gracie soon had second place with Bedouin third and Grayling fourth. The wind continued being light and club topsails were sent up. Madeline fell into place off Greenwich and at once had a bout with the Grayling, in which the sloop was soon victorious. The order off Eaton's Neck was Priscilla, Gracie, Bedouin, Grayling, Madeline, Arrow, Atalanta, Daphne, Montauk, Ruth, Clytie, Ileen, Estelle and Norna, the others being far astern. The breeze was still lighter as the day advanced, and by noon there was very little. The leaders held their places until after 2 P. M., when Grayling passed Bedouin and took third place. A couple of hours later the cutter passed her again leading her for a time. Bedouin's best work, however, was about 6 P. M., when she walked away from both Gracie and Grayling, taking second place in the fleet. As the leader entered New London she struck on a rock, but was hauled off by a steamer with but slight damage. After her came Grayling and Bedouin, Gracie being fourth. The rest of the fleet were out in the tide with no wind and a fog, so they did not get in until morning. Clio also ran aground on Bartlett's Reef, but came off easily. The times were:

	Left Glen Cove.	Arrived off Pequot House.	Elapsed Time.
Priscilla	5 30 00	8 00 05	14 30 05
Grayling	5 30 00	8 20 10	14 50 10
Bedouin	5 30 00	8 40 10	15 10 15
Gracie	5 30 00	8 45 46	15 15 46
Clytie	5 30 00	8 55 17	22 25 16
Montauk	5 30 00	8 58 12	22 28 12
Ileen	5 30 00	4 04 11	22 34 11
Ruth	5 30 00	4 04 11	22 34 11
Atalanta	5 30 00	4 10 16	22 40 16
Dauntless	5 30 00	4 40 00	23 10 00
Varuna	5 30 00	5 42 25	24 11 25
Estelle	5 30 00	5 42 30	24 12 30

Isis	5 30 00	6 01 28	24 31 28
Vixen	5 30 00	7 08 02	25 38 02
Nirvana	5 30 00	7 11 00	25 41 00
Speranza	5 30 00	8 30 00	27 00 00
Norna	5 30 00	9 01 20	27 31 20

The fleet lay at anchor all Friday, a meeting being held at which it was decided to sail at 9 A. M. on Saturday for Newport. At anchor in New London were the Puritan and Stranger, the former having left Boston at 7:30 P. M., on July 28 and reaching Newport just twenty-four hours later. Stranger left Boston one hour earlier and arrived in Newport an hour earlier also, making the same time. On Friday afternoon races were rowed for the Gamecock and Owl prizes by the boats of the fleet. A course of about one mile was marked off, starting abreast of the Polynia and around a stakeboat off the Pequot House. Six crews competed in the first race for four-oared gigs, Dauntless, Polynia, Norna, Grayling, Bedouin and Fortuna. Dauntless won by three lengths, with Polynia second. The Clio, Varuna, Mischief, Isis and Grayling sent entries for the pair-oared race, Mischief winning the "Owl" prize. In the dingey race were Priscilla, Regina and Fortuna, Regina winning.

Saturday broke with a dense fog over New London, which did not lift until late in the morning. At 11:45 the first gun was fired, and at noon the fleet went off before a brisk southwest breeze, which carried them into Newport, only dropping once or twice to a calm. The times of all the yachts were taken very carefully, as the conditions were good for a test, and this was the first meeting of Puritan and Priscilla. The start covered nearly an hour, but the new boats got away pretty well together. For a time Grayling led, with Wave Crest, Gracie, Rambler, Puritan and Priscilla in order. Shortly after the order was changed by Puritan going through Gracie's weather to second place. Priscilla had set a balloon jibtopsail, but on taking it in again her speed was improved, and she in turn took second place about 2 P. M. Off Watch Hill the wind came out ahead at 4:30. Judith it was far enough aft to allow spinnakers to draw. The fleet passed Point Judith as follows: Grayling 3:16, Priscilla 3:18, Puritan 3:26:30, Montauk 3:30:45. On the run in Priscilla headed Grayling and was the first to anchor, with Puritan third. The times of the run were:

	Start.	Arrival.	Elapsed
Priscilla	12 00 55	4 25 32	4 24 37
Grayling	11 58 50	4 26 05	4 27 15
Puritan	12 05 18	4 29 21	4 24 03
Montauk	12 04 00	4 35 02	4 31 02
Gracie	11 59 25	4 39 32	4 40 07
Rambler	11 57 00	4 39 49	4 42 49
Fortuna	12 13 00	4 39 58	4 26 58
Varuna	12 00 23	4 54 00	4 53 37
Dauntless	12 28 45	4 58 20	4 29 35
Bedouin	12 19 26	5 00 57	4 41 31
Atalanta	12 18 53	5 01 04	4 42 11
Estelle	12 05 45	5 01 21	4 55 36
Mischief	12 10 51	5 04 31	4 53 40
Ileen	12 01 29	5 05 20	5 03 57
Norseman	12 32 40	5 09 37	4 36 57
Clytie	12 09 30	5 10 14	5 00 44
Ruth	12 00 40	5 13 44	5 13 04
Arrow	11 58 05	5 14 03	5 15 58
Nirvana	12 02 27	5 14 30	5 12 03
Stranger	12 01 14	5 14 33	5 13 19
Varuna	12 03 35	5 14 55	5 11 20
Wave Crest	11 55 40	5 15 03	5 19 23
M. Wentworth	12 02 03	5 16 24	5 14 21
Madeline	12 37 37	5 16 48	4 39 16

At 6 P. M. on Sunday, Genesta arrived at Newport, having on board her owner, Sir Richard Sutton, his brother and Mr. J. Beavor Webb.

Monday, Aug. 3. Race for Goelet Cups.—The early morning breeze was fresh from the southeast, changing slightly, and settling evidently for the day to east southeast. The course was from a line between the Regatta Committee's tug and Brenton's Reef Lightship, and around the Sow and Pigs Lightship, thence to the Hen and Chickens Lightship, and back to Brenton's Reef, being a triangular course of about 45 miles. The breeze freshened up and gave the yachts an excellent opportunity to run out rapidly, and many had to beat about waiting for the preparatory signal. The entries had included the schooners Dauntless, Fortuna, Estelle, Mohican, Clytie, Clio, Montauk and Grayling, while in the sloop class there were the Ileen, Mischief, Bedouin, Athlon, Whileaway, Gaviata, Gracie, Isis, Regina and Vixen. The stiff breeze of to-day disposed of about one-half of these before the start, ten only crossing the line—four schooners and six sloops.

In the majority of instances the start was an excellent one, no less than nine yachts crossing within 7¼ minutes. The Puritan was well handled in starting, and managed to cross first, leading the Fortuna by 10 seconds and the Priscilla by 53 seconds. The following is a list of the yachts which started, with time allowance for each:

SCHOONERS. Allowances.		SCHOONERS. Allowances.	
Mohican	07 16	Montauk	12 47
Fortuna	12 31	Grayling	19 39
SLOOPS.		SLOOPS.	
Priscilla	00 00	Bedouin	10 50
Puritan	01 24	Athlon	27 15
Gracie	10 47	Isis	30 30

When the last boat had crossed the line in starting it was found that only one had failed to get in in time. This was the Bedouin, as the following table, giving the time of departure, will show:

SCHOONERS.			
Fortuna	10 27 16	Montauk	10 28 41
Mohican	10 28 39	Grayling	10 28 43
SLOOPS.			
Puritan	10 27 08	Gracie	10 33 56
Priscilla	10 28 01	Athlon	10 34 53
Iris	10 30 00	Bedouin	10 35 19

The yachts at once went in a northeasterly direction. The race down to Brenton's Reef was devoid of special interest, save that it

was a short time ere Priscilla got to the windward of the Puritan and obtained the lead, holding it securely for well nigh half an hour. Meanwhile the Gracie, tightening her sails, had been doing well, running well up to the Isis and soon closing out the four minute start which the latter had. The yachts bearing down toward Brenton's Reef, and thence along the Newport cliffs, made a pretty sight, the chief feature of which was the struggle between the Priscilla and the Puritan for lead. In tacking, shortly after wrestling the lead from the Puritan, the Priscilla lost the advantage, and in a little while the "Yankee," as yachtsmen style the Puritan, got her nose in first.

At 11:10 the steam yacht wonder Stiletto ran across the Priscilla's bows, and for a moment attention was directed toward her, the movements of the extraordinary steam craft being so rapid, and her speed so phenomenal. In the meantime the two leading schooners, the Fortuna and Montauk, were keeping company, standing off for Easton's Point, but away to the rear of the foremost sloops, which were having things much their own way. At 11:30 some important changes took place, for then the Puritan got well on to the port tack, and for a time was heading directly toward the Sow and Pigs in an effort to weather Easton's Point. Shortly afterward the Fortuna and Montauk tacked, the Priscilla, however, being still headed toward Easton's Point. It was the making of this long tack and the long delay in putting about after the Puritan had done so, that gave the latter a splendid advantage which the Boston boat maintained to the end of the race.

Four or five minutes after making a tack that brought her out from Easton's Point, the Puritan crossed the Priscilla's bows, thus increasing her advantage over the New York craft. In the mean time the Bedouin had been doing admirable work, closing up the gap between herself and the other sloops. So well was the yacht handled, and so splendidly did she behave, that there were not a few persons on board the judges' tug that predicted she would compel both the Puritan and Priscilla to scratch lively in order to secure the prize. But splendid as had been her performance up to that time, she immediately afterward began losing the advantage she had gained, and thence to the finish never came within gunshot distance of victory. The Grayling, which in Saturday's run from New London to Newport had done so handsomely, with a comparatively light breeze, was today nowhere in stiff winds. She sailed with a well-reefed mainsail, and with her topmast down, the wind acting as a sort of handicap. For all practical purposes neither the Grayling, Mohican, Isis, Gracie nor the Athlon was in the race, and neither was the Bedouin after a few minutes had elapsed subsequent to her taking the Easton's Point tack.

A few minutes before noon the Puritan made another tack from Cormorant Light. From Cormorant Light down to the Sow and Pigs the race was well contested. The two sloops led the schooners so much that only the time of the Puritan and Priscilla could be taken, the former rounding in 1:54:00 and the latter in 2:07:22. This showed a lead of nearly fourteen minutes, which many expected would be entirely wiped out when the pair began to run before the wind. The run up with the wind was from fifteen to twenty miles, a sufficient length to afford the Priscilla an opportunity to close up if she was smart enough. She was not able to do so, for in that long stretch she gained scarcely two minutes, notwithstanding the fact that she kept her gafftopsail up some thirty-three minutes longer than the Puritan did. In the meantime the Mohican had carried away her foretopsail and jibboom and foremasthead, and, being picked up by a friendly tug, was taken into Newport Harbor. The judges' boat had returned to the winning point, arriving there at 3½. Nothing was to be seen of any of the racers except the leading four, the Bedouin and Gracie being distanced, and all the others having returned into harbor.

The Priscilla did not cross until 4h. 2m. 11s., and, after giving time allowance to the Puritan of 1m. 24s., she was beaten by 10m. 19s. of actual time. This afternoon it was determined to start for New Bedford, weather permitting, about 10 o'clock to-morrow morning.

The sweepstakes race yesterday between the cutters Stranger and Isis and the compromise sloop Athlon was won by the Athlon. Sir Richard Sutton, the owner of the Genesta, is improving, and it is said to-night that the famous cutter will try her speed with the American boats on the sail to New Bedford. At a conference between the regatta committee and Sir Richard Sutton, held on board the Genesta last night, the 7th, 9th and 14th of September were agreed on as the dates for the sailing of the cup race. The trial races to select a boat to sail against the Genesta will begin on the 20th inst. The fleet will go from New Bedford to Martha's Vineyard, and a race from that place to Sandy Hook is talked about, but does not meet with general favor.

TOLEDO Y. C., JULY 28.

FOLLOWING closely on the regretta at Put-in-Bay, the Toledo Y. C. sailed their annual regatta over the club course on Maumee Bay, on July 28. Starting from Turtle Island Light, the course is seven miles out into Lake Erie, then seven miles west and home. The third class only turned the first mark and return. The twelve starters were at the line by noon, and at 12:10 all went away with a light W. S. W. wind, the order of crossing being Fanchon, Stella, Kate Graham, Crescent, Scud, Petrel, Mazeppa, Madeline, Jennie J., Osprey, Oberon and Com. Gardner. Booms were to port as they went over, Fanchon holding the lead at first, but soon passed by Kate Graham. At the first turn Scud came up and passed both of the leaders. Shortly after Fanchon made up some of her loss but could not overtake Scud, while Kate Graham carried away her spinnaker boom, losing some time. In the third class Madeline was well ahead, all being strung out, but at first mark the Com. Gardner passed her with 2min. lead. On the beat to second mark Osprey passed Crescent, but both were passed shortly afterward by Oberon. At the second mark Fanchon was again ahead, with Scud very close and Kate Graham 3min. astern, but the latter soon made up part of her loss, working in toward the Michigan shore, passing Scud. Soon after she stood in so as to lose the wind, and Scud, further out, took second place again close to Fanchon. The finish was very close, Fanchon having to tack, while Scud could lay her course over the line, but she lost some seconds by a blunder; however, she crossed 47sec. ahead. The following are the times:

SECOND CLASS.

	Start.	Finish.	Corrected.	Equated
Fanchon	12 12 27	4 29 41	4 17 14	4 16 32
Stella	12 12 45	5 04 20	4 51 35	4 47 23
Scud	12 13 58	4 28 54	4 14 56	4 14 56
Osprey	12 17 30	4 52 20	4 34 50	4 34 08
Kate Graham	12 13 15	4 35 22	4 22 07	4 19 19
Crescent	12 13 16	4 47 10	4 33 54	4 27 36
Jennie J	12 16 48	4 55 21	4 38 33	4 32 57
Oberon	12 17 42	4 54 50	4 37 08	4 36 26

THIRD CLASS.

Mazeppa	12 15 15	4 22 38	4 07 23	4 06 55
Petrel	12 14 15	4 23 30	4 09 15	4 06 55
Com. Gardner	12 18 00	3 35 15	3 17 15	3 17 15
Madelaine	12 16 40	3 36 34	3 19 54	3 18 30

HULL Y. C., July 27.—The first and second class races, postponed from July 18, were sailed on the 27th. In the first class only Hera started. In the second were the keels Banneret, Gem and Lizzie F. Daly. The wind was light from S.E. The main interest was in the second class keels, Gem sailing well until her topmast carried away, dropping spinnaker and balloon jib into the water. The times were:

FIRST CLASS.

	Length.	Corrected.
Hera, Geo. F. Howe	37.04	2 30 19
SECOND CLASS—CENTERBOARDS.		
Atlanta, J. R. Thomas	28.04	1 47 47
SECOND CLASS—KEELS.		
Banneret, J. F. Brown	25.02	1 46 48
Lizzie F. Daly, Wm. Daly, Jr	26.11	1 54 42
Gem, H. W. Savage	26.04	1 55 45

The Lizzie F. Daily has challenged the Banneret to sail three races, six miles to windward or leeward and return for $150 a side, the dates being Aug. 6, 13 and 20.

YACHTING NOTES.—Mona, this 10-ton cutter has been sold by Mr. Chas. Stevenson to Mr. J. Leslie Cotton....Electra is credited with a run of 157 knots, from Bar Harbor to Isle of Shoals, in 11h. 20m., with 85 to 90 pounds of steam....Wanda lately made the run from Cornwall to Twenty-third street, New York, in 3h. 20m., the distance being over 50 miles....Gracie and Adele. A race is talked of between these fast open boats, the course to be 10 miles to windward and return, for $250 or $500 a side, or it is proposed to admit the Nettie Thorp and Rosetta A. also for a sweepstakes race ...Resolute. This schooner has recently gone into commission for the season....Utowana. Mr. Connor's yacht has been unlucky again in breaking her shaft. The broken section has been replaced....Priscilla's model has been deposited at the N. Y. Y. C. rooms. Genesta brought out a very handsome model for the same purpose....Fanita has gone out of commission and is laid up, her owner being absent from New York....Vixen, Rear Com. Lawrence, N. Y. Y. C., is again in commission, her owner having returned from Europe ...Coronet. Mr. Bush's new schooner will probably bear this name. She is nearly ready for launching.

GENESTA.—After Mr. Beavor Webb's arrival in New York Genesta was towed up to Poillon's yard and her spars were towed over from the Anchor Line docks. The latter were all carefully wrapped in canvas and burlaps. The mast is a splendid stick of Oregon pine, 77ft. 10in. over all. The diameter at hounds is 16½in., and the greatest diameter is 17in. Her spinnaker boom is 64ft. long and 11in. in the slings. The jury mast was hoisted out, the new mast stepped and wedged, the rigging sent up and topmast pointed. Returning to Staten Island her sails were bent and the work of rigging completed. On July 30 she sailed over the N. Y. Y. C. course with Mr. Webb on board. Since his arrival here, her owner, Sir Richard Sutton, has been seriously ill and confined to his room, and the yacht has laid at anchor, but last week he was sufficiently recovered to go on board. On Saturday morning the Genesta towed through Hell Gate and made sail for Newport, where she joined the N. Y. Y. C. fleet. She will accompany the yachts on their cruise, probably entering some of the races.

TEST OF ANTI-BARNACLE PAINT.—Tarpon Springs, Fla., July 20, 1885.—*Editor Forest and Stream:* There is no place where marine pests are more plentiful or persistent than this same west coast of Florida. No wooden vessel can be kept clean for thirty days without the protection of anti-fouling paint on sheathing. Speaking of anti-fouling paint, I am reminded of some pretty severe tests made with an article advertised in your columns, "Vadium Anti-Barnacle Paint," made by the Canton Paint and Oil Company. The tests were made as follows: Stakes were prepared and painted with "Vadium," they were driven down in tide water at the mouth of the Anclote River, a place as bad if not the worst on the coast. They were allowed to remain undisturbed for four months, and then when examined were found to be comparatively free from worms, grass or barnacles, although they had been placed where a boat would have fouled in one month. People here who are posted in such matters claim that the results were perfectly satisfactory.—TARPON.

OYSTER BOAT RACE.—*Editor Forest and Stream:* The first annual oyster boat race will be sailed Aug. 22, 1885. Prizes offered by the Larchmont Y. C. Open to boats of any locality engaged in the oyster business. First class, cabin boats; second class, open boats. Cash prizes: Cabin class, first prize, $75; second prize, $35; third prize, $15. Open class: first prize, $50; second prize, $35; third prize, $15. Entries free. Larchmont Y. C. course, sailing rules and time allowances. Sails restricted to jib, mainsail, working gafftopsail, stationary ballast and limited crews. Entry blanks and sailing rules and all other information may be obtained on application to the Regatta Committee, E. J. Grearer, P. O. Box 815, New York city; John T. Fisher, 97 East Houston street, New York city; T. Bartow, Larchmont Y. C., Larchmont, N. Y.

THE BAY OF QUINTE Y. C.—Tenth annual regatta, in connection with the Lake Yacht Racing Association, will be sailed Aug. 12. The regatta will be open to all yachts on the chain of lakes, and will be governed by the sailing rules and regulations of the Lake Yacht Racing Association and under the direction of the regatta committee of the Bay of Quinte Y. C. Prizes to the amount of $450 will be offered. Entries to be addressed to the secretary. Distinguishing flag to be specified. Entries will be received up to 8 P. M. on Monday, the 10th of August. The club, however, reserves the right to receive post entries. Gentlemen who intend entering their yachts will oblige by doing so at as early a date as possible.—RICHARD S. BELL, Hon. Secretary, B. Q. Y. C. (Belleville, July 20, 1885).

THE CRUISER AND LA PERICHOLE.—The match between Mr. Alley's little Cruiser and the Newport catboat La Perichole, resulted in a victory for the latter. Cruiser is 20ft. long and was sailed by Mr. A. B. Alley, with Messrs. Frederick May, Cyrus Eidlitz, Howard Mitchell and F. M. Scott, all amateurs, while La Perichole, 24ft. long, was sailed by Mr. C. O. Iselin, with a professional crew. Both went over with an even start, Cruiser to windward. La Perichole gained on her and led at the end of the first round. Here a heavy squall struck both boats, sending the larger—which had turned—away on her course, while Cruiser was driven back from the buoy, spoiling her chances entirely.

MISTLETOE—Syracuse, Aug. 3.—*Editor Forest and Stream:* The new cutter Mistletoe, built from plans published in FOREST AND STREAM of March 6, 1884, was launched last week. She made her trial trip yesterday, and the expectations of her owners were more than realized. Frames and planking of oak, lead keel, 2,000 pounds; inside ballast, 1,500 pounds; iron floors, 250 pound; head room in cabin, 5ft. 6in. under batch. She was built for Brown Bros., and will be used entirely for cruising.

CRICKET.—Com. Mott's little sloop was at the A. C. A. camp, Grindstone Island, on July 26, for a short time, making the run from Oswego in twelve hours. Leaving Grindstone at 1:15 P. M., she made port at Oswego at 12 o'clock the same night. Her log showed 142 miles in twenty-one hours running time.

ATALANTA.—Mr. Gould is off on a cruise toward Nova Scotia, probably Halifax, but will be absent only a couple of weeks.

A PROTEST AGAINST THE STILETTO.—Mr. Jay Gould, the owner of the Atalanta, has written the following letter to the Regatta Committee of the American Y. C.: New London, July 28, Steam Yacht Atalanta. To the Regatta Committee of the American Y. C. Gentlemen—On the arrival of the Atalanta at this port last evening I was surprised by statements from disinterested observers to the effect that the Stiletto did not round the buoy at Sarah's Ledge, but passed to the northwest of it, and thereby not going over the course as stipulated in the committee's instructions. Under the circumstances please note that I protest against the cup "for the best time over the course" being awarded to the Stiletto before further inquiry. Very truly yours, JAY GOULD." The Regatta Committee will consider the protest.

NEW HAVEN Y. C. LADIES' DAY.—On July 22, the New Haven Y. C. fleet turned out in the afternoon for a sail for the entertainment of the lady friends of the club. After a sail in the harbor the fleet returned to the clubhouse which was illuminated. A display of fireworks was followed by a dance and collation.

A STEAM LAUNCH FOR THE ELECTRA.—Mr. Elbridge T. Gerry has ordered from the Herreshoff Company a steam launch 22ft. long, 5ft. 6in. beam, 22in. draft and 1,850 pounds weight, to make 8 miles per hour. She is to be ready by Sept. 10.

A CHESAPEAKE BUCKEYE.—One of these peculiar craft has lately been cruising about the Sound, the S. E. Walter, Dr. R. M. Weed of New York, owner. Her foremast is much longer than the main, giving her an odd appearance.

PAINT FOR BOTTOMS.—The perplexing problem of how to keep a boat's bottom clean and free from barnacles and borers has been successfully solved by the Canton Paint and Oil Company, whose vadium anti-barnacle paint for ships', yachts', and boats' bottoms is proving all that the manufacturers claim for it. Its use is economy, for the vadium paint not only keeps the craft in good condition, but prolongs its life many years. See the company's card elsewhere.—*Adv.*

Answers to Correspondents.

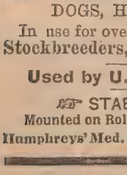
☞ **No Notice Taken of Anonymous Correspondents.**

J. B. C., Missouri.—The Tatham's shot corresponds to what is called the American standard, given in our issue of Oct. 4, 1883. The No. 8 contains 375 pellets to the ounce.

J. B. H., Nichols, Conn.—Your best plan is to read Wallace's "Guide to the Adirondacks," in which you will find a number of different routes specified with cost of travel, board and guides.

S. D., Horneilsville.—We cannot refer you to a manufacturer of steel springs for traps separate from the traps. Possibly you could secure such a thing through the dealers in sportsmen's goods.

C. E., Dodgeville, Wis.—Is there such a book as the "American Kennel Stud Book" in print, and if such how late an edition of it has been printed? Ans. The first volume of the "National American Kennel Club Stud Book" was printed in 1878. It can be had of B. M. Stephenson, La Grange, Tenn. Price $3. The second volume was to have been printed the next year, but it is still "in the printer's hands," with no prospect of its ever being given to the public. The *American Kennel Register* is published monthly, Address P. O. Box 2832, New York.



H. F. B.—Will you inform me how salmon roe is prepared for bait for fishing purposes? Ans. We have never used it. Scott recommends that it be salted and placed in a pot with alternate layers of wool. He quotes Rev. W. B. Daniell as advising the taking of a pound of roe in September, and after boiling it fifteen minutes, beat it in a mortar until sufficiently mixed with an ounce of salt and an ounce of saltpetre, the membrane in which the spawn is contained being carefully picked out. It is then packed in jars and covered closely, and will keep for months.

W. A. K., Fort Monroe, Va.—The Encyclopedia Britannica, ninth edition, article, "Deer," makes moose and elk synonymous. Webster's unabridged does the same, and opposite the word elk places a cut of the Canadian moose. If these works are correct what species of stag is the so-called elk of the West and Northwest, and how is it possible that so noble and conspicuous an animal escapes mention by the authorities quoted? Ans. Moose (*Cervus alces*) and the American elk (*Cervus canadensis*) are two distinct species of the genus *Cervus*. Some writers, as Griffith (Cuv., IV., 72), have applied the term "elk" or "American black elk" to the moose. Our encyclopedias and dictionaries, even the best of them, are deficient on many subjects relating to natural history.

POT LUCK FROM EXCHANGES.

Several Austin gentlemen started out one Sunday last winter for the purpose of desecrating that day. They carried guns and flasks with them for that purpose. The flasks were not as dry inside as a powder-horn. They were not that kind of flasks. Finally they saw ducks, and proceeded to organize a campaign plan. They crawled up on the ducks on their stomachs—that is, on their own, the hunters' stomachs—and blazing away, killed two ducks. The Sunday hunters secured their prey, and proceeded to the cabin of an old darky close by, for the hunters were hungry. They told him they would shower down wealth upon him if he would cook their wild ducks for breakfast. The old darky turned over those wild ducks and exclaimed; "Dem ar is my tame ducks, and dey is wuff fifty cents apiece. Dey is so tame dey runs arter me wheneber I goes down to de pond." Then the hunters looked at each other and said: "Don't let us tell anything about it for fear the sifter may get hold of it," and they paid over one silver dollar to the African for his pet ducks, which he did cook for them. But the best of the joke is that the old darky lied, for the ducks were really wilk ducks after all; but the Austin sportsmen do not know the difference. The old darky makes as much as $10 a Sunday by going out and claiming all the wild ducks that are shot as his tame ducks. In every instance the huntsman hands over the money.—*Alex. E. Sweet, in Arkansaw Traveller.*

The officers of the English garrison in the Soudan have less shooting to amuse themselves with than was anticipated. Sand grouse are quite plentiful, coming down in the early morning to feed on patches of ground near the river, from which the corn has lately been cut; but these are learning to be wary of guns. These grouse are excellent eating, but the more plentiful doves are not worth powder and shot.

SELECTED PATTERNS FROM ABBEY & IMBRIE'S

Standard American Trout and Bass Flies.

Named and Numbered, with full description of material, color, etc.

Extract from FOREST AND STREAM.—"Useful for reference."

Extract from *American Angler*.—"The most accurate and otherwise satisfactory plate of American trout and bass flies that has yet been offered to the angling brotherhood."

The two points that have been kept constantly in view in making this selection are: First, the presentation of flies which are well known and highly approved by our most experienced anglers. Second, the selection of flies that are typical, that is, such as represent classes to which the great majority of really good flies can be referred.

PRICES:

In Black and White	25 cents per copy.

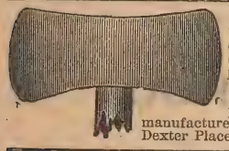
Hornbeam Rods



A SPECIALTY.

W. HUNTINGTON,
WILTON, CONN.,

Makes a specialty of the manufacture of FINE HAND-MADE RODS of Hornbeam for fly-fishing. Every fly-fisher should have one of these rods, for whatever preference he may have these are the only thoroughly reliable rods, secure against breakage and capable of real hard usage. With one of these rods a sportsman may venture into the woods for a season and take no other rod, and be fairly sure of returning with it in a serviceable condition. As made from wood of my own cutting and seasoning, they are powerful, easy in action and full of endurance. For circular send to WALLACE HUNTINGTON as above.

To Anglers!

F. A. ALLEN'S SPECIALTIES.

MONMOUTH, ILL.

ALLEN'S DUCK CALL—Improved, Nickel Plated; the most natural-toned, easiest-blowing, smallest and only Metal Duck Call ever invented and the only one that perfectly imitates the *wild* duck. Sent by mail on receipt of $1.

ALLEN'S BOW-FACING OARS—Can be attached to any boat in five minutes, shipped instantly in the roughest water; work much easier than the common oar. In duck shooting they are invaluable; you see the bird the instant it leaves the water. Sent by express on receipt of $8.

ALLEN'S SHELL GAUGE—Will reduce brass shells to their original size in one-half minute, making them as smooth and solid as when new. On ordering mention gauge wanted. Sent by express for $1; by mail $1.30.

ALLEN'S DECOY DUCK FRAME—Is a simple device for holding the dead duck in a natural position in the water. Price $4 per doz. **SEND FOR CATALOGUE FREE.**

AIR GUNS

PRICES: $6, $9, $10, $12, $15, $18 and $20.

FOR PROFIT AND PLEASURE.

The gun shown above is our **NEW COMBINATION AIR GUN.** This is the most complete arrangement ever offered. It combines two pieces in one (a perfect Rifle to shoot a regular .22-100 cartridge, and a superior Air Gun to shoot darts, slugs and shot). It can be instantly changed from one to the other, and has a steel barrel rifled. All the parts extra heavy, and so constructed of best material to stand continuous service, making the most durable gun manufactured, and by far the most practical long-range Air Gun ever made for gallery or field. WE MANUFACTURE A FULL ASSORTMENT OF AIR GUNS SUITED TO MEET THE TASTES AND WANTS OF EVERY ONE. The quality of our goods has established them in all the principal markets of the world, and their superiority has induced the United States Navy to place them, with success, on their school ships. ☞Illustrated price lists sent upon application. If you are not opposed to a change and cannot obtain them of your dealer, send to the manufacturers for a sample.

Enclose Three Red Stamps. **WM. S. KIMBALL & CO., Rochester, N. Y.**

CANOE HANDLING.

By C. B. VAUX ("DOT").

A complete manual for the management of a canoe. The author begins at the very beginning, describes and explains the rudiments in the simplest and plainest way possible. Everything is made intelligible for beginners; and besides this A B C teaching there are so many hints and wrinkles that the oldest canoeist afloat will find pleasure and profit in the study of these. The book is complete and concise—no useless duffle between its covers. The subjects treated are the choice of a canoe, paddling, sailing, care of the canoe, recipes and rules. The text is further elucidated by numerous practical drawings, and the beauty of the book is enhanced by the many ornamental vignettes. Pages 168; uniform with "Canoe Building." Price, postpaid, $1.00.

"FOREST AND STREAM SERIES."

DEER HUNTING.

BY JUDGE JOHN DEAN CATON.

BY and by it will be time to hunt antelope and deer. It is always time to read about them. Judge Caton's book on the antelope, elk, deer, moose and caribou of America discusses in a readable way the life history of these animals and the methods of their capture. It is the work of an enthusiastic sportsman who has had a wide experience and has devoted the leisure of years to studying these interesting game animals. The volume is very fully illustrated, and is a perfect storehouse of information and entertainment. The first edition was sold by the Boston publishers at $4. Price $2.50.

WOODCRAFT.

BY "NESSMUK."

A COMPACT pocket handbook of condensed, boiled-down, concise, clear, comprehensive, sensible, practical camp gumption. "Nessmuk" has been "in the woods" in Michigan, New York, Pennsylvania, and South America, and this is a book for outers, wherever they kindle their camp-fire. The author believes in "smoothing it." He has learned how; now he tells others. It is much easier to learn from "Nessmuk" than from Dame Experience. We should not be surprised if "Woodcraft" completely revolutionized the methods of camping out. If you are going to the woods, read "Woodcraft" before you go. It may add to your trip a hundred fold. Price $1.00.

DOG TRAINING.

BY S. T. HAMMOND.

HE was a promising puppy, and when you turned him over to the breaker to be educated, you thought he was bound to make "the best dog in the world." And you'll not soon forget how disappointed and disgusted you were when the dog, the breaker and the big bill—all three turned up together, and you saw that the animal's spirit was broken and it would take a steam calliope to make him mind. Now, this could not have happened if you had been wise enough to buy a copy of Hammond's book, and in your odd leisure moments *train* the dog yourself instead of having him *broken* by some one else. We are selling edition after edition of this book, and it is revolutionizing the system of preparing dogs for work in the field. Price $1.00.

SHORE BIRDS.

A PAMPHLET for those who "gun" along the shore. Tells of: I. Haunts and Habits—Where the bay birds live and what they do at home. II. Range and Migration—Where they go to breed and where to spend the winter. III. A Morning Without the Birds—An episode of shore shooting. IV. Nomenclature—A list of our American species of *Limicolæ*, with a description of each specie. V. Localities—Where to go to shoot them. VI. Blinds and Decoys—How to shoot them after you have reached the grounds. 45 pp., paper. Price 15 cents.

ANGLING TALKS.

BY GEORGE DAWSON.

AS a political writer of conceded power, Mr. Dawson wielded a trenchant pen; when he turned from the conflict of parties to the praise of the favorite pastime of "simple wise men," his essays, limpid as the crystal streams, are aglow with the soft summer sunlight and melodious with the songs of birds. When angling was the theme, he wrote from a full heart and in closest sympathy with the scenes and pursuits described. These "Talks" are brimful of manly, wholesome sentiment; there is in them all not a particle of cant. Their sincerity and overflowing spirit at once win the reader, and he perforce shares the author's enthusiasm. The effect is magical, like that of the mimic players in Xenophon's *Memorabilia:* he who reads, if he be an angler, must go a-fishing; and if he be not, straightway then must he become one.—*Extract from Publishers' Preface.* Cloth, price 50 cents.

CANOE "AURORA."

BY DR. C. A. NEIDÉ.

A CHARMINGLY written and always entertaining account of a canoe cruise from Lake George, New York, down the Ohio and Mississippi Rivers to the Gulf of Mexico, by the Secretary of the American Canoe Association. To read the cruise of the "Aurora" is the next best thing to having made it; and the reading is decidedly more pleasant than would have been participation in some of the misadventures related. 216 pp., cloth. Price $1.00.

Any of the above books can be obtained in London of Davies & Co., 1 Finch Lane, Cornhill.

GLOBE FLIGHTS

PERFECT TARGET.

The **Globe Flight** consists of a pasteboard disk, 5½ inches in diameter, the center cut out to admit a rubber balloon 2¾ inches in diameter, when inflated. Good until hit with shot. One pellet shot hitting the balloon, *Dead Bird!* No rubbish, no disputes. Preferable at all tournaments and matches. Full count. Handsome target, hard to hit unless you point your gun straight. Same surface always presented. Satisfactory shooting, fair and good practice. Case contains 500, weighs 50 lbs.; cheap to transport. $20 per 1,000; $2.50 per 1,000 back for pasteboards in good condition at either factory. Hand inflators, 50 cents each. Can be sent by mail. Send four cents to pay postage on sample flight.

CANOE

THE FOREST AND STREAM began a year ago the publication of a series of papers on canoe construction, by Mr. W. P. Stephens, of the New York C. C., widely known as an expert on canoe design and building. These papers, having appeared through the year in our columns, have since been rewritten, and with numerous additions are now published in a handsome volume under the title of "Canoe and Boat Building for Amateurs." Mr. Stephens is peculiarly fitted for the preparation of such a work, beginning as an amateur, and having after a long experience of the difficulties attending a learner, taken a prominent place among canoe builders, due both to the model and workmanship of his canoes. Realizing fully the difficulty of examining to a novice an art in itself far from easy,

AND

and with which he is entirely unfamiliar, the book begins with a description of the various classes of canoes in general use, with their main features and dimensions, and definitions of the terms used in connection with them. Numerous examples of canoes are given, and in connection with them, such plain instructions in designing as will enable the beginner to select intelligently the proper craft for his pur-

BOAT

pose, and to plan her dimensions, details and fittings. To this end designs of all classes of canoes are given, with full dimensions and details. The object has been not merely to enable the tyro to build one boat as described, but to teach him the principles of designing and building in such a way that he may construct such a craft as he desires. Following the chapters on designing, the construction of a canoe is taken up in detail, the tools and appliances being first clearly described, as well as the various materials, after which follows the actual work of building. Every operation is taken up in order, from the selection of the keel to the varnishing of the finished boat, and illustrated with numerous diagrams.

A chapter on sails describes all the varieties in use by canoeists, down to the new Mohican settee, with directions for making, rigging and measuring them, while the method of proportioning the sails to the boat is clearly explained, all the calculations

BUILDING

being worked out in detail. The many minor points of a canoe, paddles, steering gears, rudders, aprons, and camp outfit are also described at length, while a chapter is devoted to canvas canoes.

The subject of boat building is fully treated, a rowboat of the usual construction being taken as an example, and described in all its parts in such a manner as to make clear the principles involved, and their application to any form of boat, either lapstreak or carvel build. Each of the numerous technical terms belonging to the subject is defined clearly when it first occurs, and as the index is full and complete, the book is in itself a glossary.

In addition to the numerous diagrams in the body of the work, twenty-four large plates are printed on bond paper, containing the working drawings of canoes for paddling, sailing, cruising

FOR

and racing, with their sail plans, rowing sailing boats, large canoe yawls, and various boats for special purposes, such as gunning boats, yacht boats, and the widely known sneakbox.

The canoe yawl, a boat between a canoe and a yacht, is illustrated by examples of various craft from 17 to 20ft. long, and suitable for a crew of two or three on a cruise. This class of boat, while little known among us as yet, is admirably fitted for cruising, and will meet the wants of many who object to a canoe as being too small, and yet desire a boat with the same excellent qualities. The boats and canoes illustrated are in all cases among the best of their class, the list of canoes including English, Scotch and American craft, and are all drawn

AMATEURS.

to scale, so as to be available as working drawings. The plates, for convenience in using, are placed loose in a tough manilla envelope and accompany the book.

Pp. 168, with 24 plates of working drawings. Price $1.50. Address,

GRATEFUL—COMFORTING.

EPPS'S COCOA.

BREAKFAST.

"By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast tables with a delicately flavored beverage which may save us many heavy doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame."—*Civil Service Gazette.*

Made simply with boiling water or milk. Sold only in half-pound tins by Grocers, labelled thus:

JAMES EPPS & CO., Homœopathic Chemists, London, England.

HINDS' BLACK-FLY CREAM,

For Repelling

Flies, Mosquitoes, Midges and other Insects, and protecting the Skin from Sunburn, Irritation and Infection.

No Tar. No Stain.

GLENS FALLS, N. Y., June 15, 1884.

Mr. A. S. Hinds, Portland, Me.:

DEAR SIR—I have not sooner acknowledged the receipt of box of "Black-Fly Cream," as I desired to first test it; this I have now done on two fishing trips where I found the Mosquitoes, Black Flies, Punkies and Moose or Deer Flies in great abundance. Although all these pests swarmed about me, I found the *Cream a perfect preventive* against their bites when it was applied to face, hands, ears and neck. For many years I have sought after *the* insect repellent, and have tried all manner of compounds, but yours is the most thorough, at the same time cleanly and not disagreeable.

Yours truly, A. NELSON CHENEY.

Price, 25 Cents, Postpaid.

SOLD BY DEALERS IN SPORTING GOODS.

"Repellene,"

An infallible preventive of the attacks of Mosquitoes, Black Flies, Gnats and all other insects. Neat, clean and easily applied. BRADFORD RUBY.

(Champion Lovat—Champion Jenny.)

Champion pug dog, winner of **41** prizes, cups and medals in England, including championship Crystal Palace, January, 1885; 1st, Cincinnati; 1st and special, Toronto; 1st, Philadelphia. Fee $25.

NAPOLEON (A.K.R. 2037) (Sambo—Luca)—The sire of many good ones, including first and second prize winners, New Haven, 1885. Fee $15.

Puppies for sale. CITY VIEW KENNELS, Box 689, New Haven, Conn.

The Kennel.

For Sale Cheap.

Thoroughbred Llewellyn setter bitch Nellie B., whelped May, 1883, by E. E. Hardy's Pollux (Dash III. ex Dianna) out of E. E. Hardy's Elsa (Luther Adams's Drake ex Countess May, she by Dash III. ex Countess II.). She is evenly marked, black head and blue ticked body, is house and yard broken, staunch on point, has good disposition. Also three of her pups, evenly marked heads with ticked body, by A. M. Tucker's Count Bondhu (Gus Bondhu ex Countess Mollie, she by Count Noble ex Spark. I warrant any of the above to suit the purchaser, or I will refund the money. For prices and extended pedigree address D. A. GOODWIN, JR., Newburyport, Mass. aug6,2t

---

Mt. Pleasant Kennels.

For Sale—Two thoroughbred Gordon setter dog pups, 4 mos. old; $10 each if taken at once: out of my Beaulah, by Toney. Also first-class English pug puppies, $15 each. C. T. BROWNELL, Box 335, New Bedford, Mass. jy16,3mo

---

Beaufort Pups For Sale.

Six dogs and one bitch, all lemon and white, fine and healthy, by Beaufort ex Lady Maud. Lady Maud's sire by Sefton, dam by Flake. Lady Maud is a good show bitch and a first-class field worker. Pups should be of extra quality. Price $35 each; $60 brace. SURREY KENNELS, Ellicott City, Md. aug6,1t

---

Winlawn Kennel.

Several fine mastiff puppies from prize dogs for sale. Address W. P. STEVENSON, 17 Broad st., N.Y.

FOR SALE.—ITALIAN GREYHOUND PUPS from imported stock. HENRY C. BURDICK, 150 Bridge st., Springfield, Mass. mar19,tf

---

WM. GRAHAM, NEWTOWNBREDA, BELFAST, Ireland, is prepared to purchase and ship dogs for importers. Dogs purchased from him had the following prizes awarded to them: At New York and Chicago, 1883, sixteen firsts, nine special, three second and one third. At New York, 1884, seven firsts, six specials and one third.

CHAMPION BRED ST. BERNARDS. CHAMPION BRED ENGLISH PUGS.

Enclose stamp. CHEQUASSET KENNELS, Lancaster, Mass.

FOR SALE, A NUMBER OF WELL BRED AND well broken pointers and setters, also dogs boarded and broken, satisfaction guaranteed. Address H. B. RICHMOND, Lakeville, Mass. Sept22,tf

---

Prize and Pedigree English Mastiffs.

American gentlemen desirous of purchasing these noble dogs should communicate with JAMES HUTCHINGS, 25 Gandy street, Exeter, England, who has the largest kennel of mastiffs in the world.

K 9 Breaking Kennels.

Pointers and setters thoroughly broken for field trials or private use. Reference given. W. G. SMITH, Field Trial Trainer, Templeville, Md.

BOOK YOUR DOGS FOR THIS SEASON'S training on woodcock, partridge and quail, commencing Aug. 1. Fifty dollars for the season. D. F. WILBUR, Myricks, Mass. jy9,tf

---

FOR SALE.

Thoroughbred Newfoundland pups, from prize stock. Also one of the finest black cocker bitches in the country. Address ACADIA KENNEL, P. O. Box 2,574, Boston. jy9,5t

---

Rory O'More Kennels.

For Sale—Thoroughbred red Irish setter stock, full pedigreed. Address with stamp, W. N. CALLENDER, Albany, N. Y.

POINTERS AND SETTERS FOR SALE.—A litter of orange and white setter pups, a litter of lemon and white pointers, a litter of liver and white pointer pups at 8 wks old, $10; field qualities guaranteed. Address ELM GROVE KENNELS, P. O. Box 258, South Norwalk, Conn. jy16,4t

---

FOR SALE.—HAVING RECENTLY ADDED several fine brood bitches to the Landseer Kennels of Scotch deerhounds and greyhounds reduced the price of puppies. Some choice greyhounds now ready to ship. DR. VAN HUMMELL, Denver, Col. apl16,tf

---

DOGS. DO YOU WANT TO BUY A FINE bred dog of any kind? If so write and name the kind you want. EDMUND MAURER, 464 North Ninth street, Philadelphia, Pa.

YOUR DOG'S PICTURE.

Life size crayons of dog heads or full figure accurately and artistically made from photograph by an experienced crayon artist. Prices reasonable; satisfaction guaranteed. M. LEWIS, care Forest and Stream.

CHEAP.—BEAUTIFUL BLACK, WHITE AND tan setter pups, 4 mos. old, from exceptional field stock; $15. E. F. THOMAS, Monticello, N. Y. jy23,3t

---

FOXHOUND PUPPIES FOR SALE, BRED FROM imported prize-winning stock. Address Box 178, Montclair, N. J. jy23,3t

---

FOR SALE.—FOUR POINTER PUPS, 14 WKS. old, good blooded stock, color liver. Price $10 each. Apply to J. J. ILLSLEY, Georgetown, Mass. jy30,2t

---

FOR SALE.—THE THOROUGHBRED IRISH setter bitch Jessica, and two pups, 4 mos. old. For price, etc., address THOS. MONTAGUE, Hammondville, N. Y. jy30,2t

---

BULL-TERRIER BITCH NELLIE (A.K.R. 2194), 3 yrs. old, pure white, full pedigree; bred by Hinks, of Birmingham, England. Has won 1st, St. John, 1884 and 1885, vhc, New Haven, 1885, and 2d, Boston. A splendid brood bitch; will be in season soon. Price $50 cash. Address E. S. PORTER, Kennel Club, New Haven, Conn. jy30,2t

---

FOR SALE—THE MASTIFF DOG DE BUCH (A.K.R. 1502), 3 yrs. 4 mos. old, 1st, New York, 1883, of immense bone and substance, powerful, symmetrical and compact, of excellent temper. A valuable sire to mate with weedy bitches, always transmitting his great bone and substance. W. WADE, Hulton, Pa. jy30,5t

---

FOR SALE.—PURE LAVERACK PUPPIES, combining the blood of Pontiac ex Fairy II. Carlowitz ex Princess Nellie, Thunder ex Peeress, etc. HENRY STURTEVANT, Medina, N. Y. jy30,5t

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, $4 A YEAR. 10 CTS. A COPY. SIX MONTHS, $2.

NEW YORK, AUGUST 13, 1885.

VOL. XXV.—No. 3. NOS. 39 & 40 PARK ROW, NEW YORK.

CORRESPONDENCE.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. Communications upon the subjects to which its pages are devoted are respectfully invited. Anonymous communications will not be regarded. No name will be published except with writer's consent. The Editors are not responsible for the views of correspondents.

ADVERTISEMENTS.

Only advertisements of an approved character inserted. Inside pages, nonpareil type, 25 cents per line. Special rates for three, six and twelve months. Reading notices $1.00 per line. Eight words to the line, twelve lines to one inch. Advertisements should be sent in by the Saturday previous to issue in which they are to be inserted.

Transient advertisements must invariably be accompanied by the money or they will not be inserted.

SUBSCRIPTIONS

May begin at any time. Subscription price, $4 per year; $2 for six months; to a club of three annual subscribers, three copies for $10; five copies for $16. Remit by registered letter, money-order, or draft, payable to the Forest and Stream Publishing Company. The paper may be obtained of newsdealers throughout the United States, Canadas and Great Britain. Newsdealers in the United Kingdom may order through Davies & Co., No. 1 Finch Lane, Cornhill, London. General subscription agents for Great Britain, Messrs. Sampson Low, Marston, Searles and Rivington, 188 Fleet street, London, Eng.

Address all communications.

ANSWERS TO CORRESPONDENTS.

THE ST. LOUIS CONVENTION.

THE original call for the St. Louis convention, to be held Sept. 29, has been so modified as to include the sportsmen of the entire country, with all fish commissioners and the game dealers of the large cities. The promoters of the meeting express their anticipation of a very large gathering and of important results to follow.

The invitation is a very broad one. Some may consider it to be entirely too broad. The tendency of movements of this sort, when once they have set out to become "national," is to become at the same time unwieldy. Because of their size and the conflicting interests represented, such a meeting is very apt to result in nothing more than talk and resolutions. This is all the more possible on such an occasion as that of the St. Louis convention, because there the interests which will be given a hearing are in decided opposition. The members of the game protective clubs in our large cities who have for years noted the attitude of the game dealers toward the game laws will be apt to view with extreme suspicion the presence and participation of these dealers in a convention called for the purpose of modifying the laws regulating the sale of game. The sportsmen who have seen their covers depleted by the pot-hunters to supply the markets will naturally question whether any real advance in our protective system is likely to follow the St. Louis convention if the dealers are to have a hand in it. It is announced that New York game dealers and other Eastern dealers will be present. The sportsmen of the West ought to know that if these men are represented there they will be on hand for only one thing, which will be the modification of existing laws in such a way that more game may be shipped to the East. There is no conceivable reason why they should attend for any other purpose. They are sharp, shrewd business men, and if they go to St. Louis they will go there for business.

Some years ago, when the attempt was made to blind the sportsmen of New York State by a coalition of sportsmen and dealers, and under cover of a pretended sportsmen's association to foist on the people of this country the notorious refrigerator amendment, it was stated to the writer by one of the most active promotors of that scheme, that he was proposing, at the suggestion of certain St. Louis dealers, to form a national association of sportsmen and dealers for securing better game legislation. The refrigerator amendment was a sample of the kind of legislation they wanted. If the dealers are now going to the St. Louis convention as a step toward securing next winter what they lost when the refrigerator amendment was killed, they will bear very close watching.

THE CANOE ASSOCIATION.

THE meet of 1885 did not differ greatly from that of last year on the same ground, the number present being rather smaller, while the race programme was the best yet offered. It has been claimed that the smaller attendance was partly due to the camp being in the same place as last year; but there are other causes that have had much more influence on the attendance. There are many who cannot afford time or money to visit camp every year, and who last season made a special effort to visit the Thousand Islands and the Canoe Meet at one time. In at least two cases clubs which were well represented last year, have this season been under extra expenses for houses at home, and have been poorly represented, and the general condition of business has had an unfavorable effect on summer travel of all kinds in the St. Lawrence region. To make up for the smaller number there were many new faces, representatives of new clubs and localities, who go back resolved to extend the Association at home.

This meet will be remembered by the fact that for the first time measures have been taken to divide, to a certain extent the Association and to provide other meets in distant localities. This scheme has been talked of for some time and now has been put into practice. The question of the place for meeting next year will soon have to be decided, and is perhaps the most important one before the Association. Many wish to return to Grindstone for another year, while others desire a new place. There is yet time before the Executive Committee meet for a full discussion of the question and for the suggestion of other sites, and as it is a matter that concerns all canoeists, we hope to hear from them on both sides of the question, as a thorough discussion of the question in the columns of FOREST AND STREAM will bring forth the views of all more effectually than any other method.

THE TRAJECTORY TESTS.

THE hearty responses of approval, which have come in since our announcement of last week that a careful test of hunting rifles would be made by us, show that there is a general demand for just such a trial. The suggestions which come in are many, and from time to time we shall print such as may be offered by others.

The idea is simply to make a series of tests over a carefully surveyed range, with every item as to the weapon and the conditions under which it is shot most carefully noted. We do this to furnish data from which any and all riflemen may draw their own conclusions.

The details of much of the work to be done have not as yet been formulated into any set of rules. The programme will, however, be made as broad and liberal as possible, and every point in connection with the tests will be open to the fullest investigation and scrutiny. Rifles of to-day, those which are in the market, in the hands of hunters and most likely to be there, are the arms which we more particularly wish to test. We know of no such set of trajectory trials made in recent years which is of any but the most remote interest at this day.

When we mentioned 200 yards as the distance over which the tests would be made, it was with the idea that this was to be the maximum range; but the surveys and measurements of the range will be such as to make the tests at the lower ranges a matter of the greatest ease.

CANADA SUNDAY FISHING.—Sir Roderick Cameron and his friend Judge Henry, who have been in trouble for Sunday salmon angling, plead that the statute forbidding fishing on that day relates only to netting. It is a pretty poor plea. What is good law for the netter is good law for the angler; and because the netter looks upon the law as enacted largely for the angler's benefit alone, the angler should show himself hearty in observing it to the letter. If the fly-fisherman cannot forego his sport for one day in the week, how can he reasonably expect the man whose livelihood depends on netting, to take up his nets for Sunday? More than this, the streams ought to have one day of absolute rest from both anglers and netters.

THE OLD WAY.—The other day we came across a little manual for travelers, giving with careful detail all the routes of travel by "stage lines, canals and packets" between the prominent American towns. It was not so very old, bearing a date in the present century, but it had the flavor of a thousand years of antiquity.

POSSESSION IN CLOSE SEASON.

IN our angling columns will be found an opinion recently rendered by Judge Turner, of Washington Territory, in a case where a dealer had been arrested for having in his possession in the close season some trout which were alleged to have been brought into the Territory from Idaho.

This decision invites careful consideration for several reasons. It is manifestly that of a judge in sympathy with, and desirous of giving full effect to, legislation designed to protect fish and game. It is a thoughtful determination of the issues presented, and, whether right or wrong, is arrived at after contemplation of high authorities bearing upon the questions raised.

A clearer understanding of its import can be had on reading the following portions of the statute which it construes:

§ 7. Every person who shall, within the Territory of Washington, during the months of November, December, January, February and March of any year, catch, kill or have in possession, sell or offer for sale, any mountain or brook trout, etc., shall be guilty of a misdemeanor.

§ 10. Every person who shall, within the Territory of Washington, have any male deer, * * * brook trout, etc., at any time when it is unlawful to take or kill the same, as provided in this act, shall be guilty of a misdemeanor, and proof of possession of any of the aforesaid animals, fowls, birds or fish, at a time when it is unlawful to take or kill the same in the county where the same is found, shall be *prima facie* evidence in any prosecution for a violation of any provision of this act that the person or persons in whose possession the same is found, took, killed or destroyed the same in the county wherein the same is found during the period when it was unlawful to take, kill or destroy the same.

The penalty prescribed for a violation of this act (§ 13) is "a fine of not less than $10 and not more than $300, or imprisonment in the county jail of the county wherein the offense was committed for not less than five days nor more than three months, or both such imprisonment and fine."

Judge Turner decides, first, that this act does not forbid the possession, within the State during the close season, of game lawfully taken in another State; and, second, he states that if the statute did forbid such possession it would be in violation of the Federal Constitution, which provides that Congress shall have power to regulate commerce among the several States. The latter point, although a mere *dictum*, is the more important for the double reason that the decision suggests very strongly that, had the judge not concluded that a statute, which made the possession within the State of game lawfully taken without the State an offense, would be unconstitutional, he would have construed the statute differently; and that this interpretation of the United States Constitution by a Federal judge is likely to have a large influence upon the courts of other States in passing upon similar statutes.

In determining upon the weight to be given to this *obiter* decision of a single judge in disposing of a *habeas corpus* proceeding, it is well to bear in mind that the New York Court of Appeals, an appellate court consisting of seven judges, and second to none in this country except the United States Supreme Court, has given a contrary decision in a case which fairly raised the same questions, under a statute quite similar to that of Washington Territory. The language of the late Chief-Justice Church, who wrote the opinion, is: "It is unnecessary to consider how far the exercise of the power of Congress under this provision would interfere with the authority of the States to pass game laws, and regulate and prohibit the sale and possession of game either as a sanitary measure or for its protection as an article of food. It will suffice for this case that the statute does not conflict with any law which Congress has passed on the subject. States cannot pass laws in respect to subjects expressly prohibited by the Constitution, nor when the power is conferred upon Congress and its exercise by the States conflicts with the policy or functions of the Government; but there are many powers conferred upon Congress which, until exercised by it, are regarded as dormant and may be exercised by the States within their limits, among which is the power to regulate commerce. * * * It is quite evident, within these principles, which have been repeatedly reiterated by the Supreme Court of the United States, that the act in question does not violate the Constitution of the United States nor any law of Congress." *Phelps v. Racey*, 60 *N. Y.* 10.

The same question came before the Supreme Court of Illinois, and in an unanimous decision indorsing and following that of the New York Court of Appeals, it was held that such prohibition of the possession and sale of game was not a restriction of inter-State commerce; but that the law related only to internal commerce of the State in the article of game, that it acted altogether upon the retail or domestic traffic within the State, and that the State was not bound to

furnish a market for game, nor furnish game for a market. *The People v. Magner.*

The Missouri Court of Appeals has expressed itself with equal clearness and emphasis: "It is urged by defendant that inasmuch as it appears that these prairie chickens were imported from Kansas, there can be no conviction. But the act in question makes it a penal offense to have prairie chickens in one's possession from February first to August fifteenth in Missouri, no matter where the birds were caught. It is insisted that if this be the meaning of the act, it is in violation of the Constitution of the United States, Congress alone having power to regulate commerce among the several States. We see nothing unconstitutional in the act. The game law would be nugatory if, during the prohibited season, game could be imported from the neighboring States. It would be impossible to show in most instances where the game was caught. The State of Missouri has as much right to preserve its game as it has to preserve the health of its citizens, and may prohibit the exhibition for sale, within the State, of provisions out of season, without any violation of the Constitution of the United States. So far as we know, this right has never been disputed, and its exercise by the absolute prohibition of the having in possession, or sale, of game within the State limits, during certain periods of the year, is no more an illegal attempt to regulate commerce between the States than would be a city ordinance against selling oysters in July." *The State v. Randolph*, 1 *Mo. App.* 15.

To sustain his position antagonistic to the foregoing eminent authorities, Judge Turner has sought to gain support from an opinion of the United States Supreme Court. But has he succeeded in doing so? Does the case of the *Railroad Company v. Husen*, in any way apply to the question before him? The Missouri statute before the United States Supreme Court was very different from that considered by Judge Turner. It was aimed directly at and was clearly a regulation of inter-State commerce. As the court expressed it: "The Missouri statute is a plain intrusion upon the exclusive domain of Congress. It says to all natural persons, and to all transportation companies, 'You shall not bring into the State any Texas cattle, or any Mexican cattle, or Indian cattle between March first and December first, in any year * * * and, if you do bring them in, even for the purpose of carrying them through the State without unloading them, you shall be subject to extraordinary liabilities.'" The object and effect of this statute were held to be to obstruct inter-State commerce, and to discriminate between the property of citizens of one State and that of citizens of other States. But in reaching this conclusion the court made admissions quite broad enough to include a statute differing so much from the one before it as does the statute of Washington Territory, which does not directly touch upon the subject of transportation, or commerce, and makes no discrimination between the property of citizens of different States. Their words are: "We admit that the deposit in Congress of the power to regulate foreign commerce and commerce among the States was not a surrender of that which may properly be denominated police power. What that power is it is difficult to define with sharp precision. * * * It extends to the protection of the lives, limbs, health, comfort, and quiet of all persons, and the protection of all property within the State. * * * Many acts of a State may indeed affect commerce without amounting to a regulation of it in the constitutional sense of the term. And it is sometimes difficult to define the distinction between that which merely *affects or influences and that which regulates a rule for conduct.*"

Was Judge Turner right when he said of the statute of Washington Territory: "This is a regulation of commerce between the States within the meaning of the Constitution of the United States," or is it rather a legislative act as to a matter not strictly national, but local in its character, concerning which Congress has made no legislation, and affecting rather than regulating inter-State commerce—in other words, a proper exercise of the police power of a State or Territory? Is it not more nearly allied to those State enactments which authorize the bridging of navigable streams, or prohibit the sale or manufacture of intoxicating liquor, both of which have been repeatedly sustained by the United States Supreme Court? Chief Justice Taney said in deciding a case which involved the right of a State to require a license for the sale of a package of gin imported from another State: "As Congress has made no regulation on the subject, the traffic in the article may be lawfully regulated by the State as soon as it is landed in its territory, and a tax imposed upon it, or a license required, or the sale altogether prohibited, according to the policy which the State may suppose to be its interest or duty to pursue."

The highest courts of three States, New York, Illinois and Missouri, are opposed to the conclusion reached by Judge Turner; and in harmony with their ruling is the language of the United States Supreme Court in decisions rendered the present year: "The States have the power, in absence of Congressional legislation, to regulate matters of local interest which affect inter-State commerce only incidentally." *Brown v. Houston*, 114 U. S., 622. *Gloucester Ferry Co. v. Pennsylvania. Id.* 196.

And where the question was the constitutionality of certain provisions of the constitution of the State of Illinois as to the regulation of warehouses, the Court said: "Incidentally they [the warehouses] may become connected with inter-State commerce, but not necessarily. Their regulation is a thing of domestic concern, and certainly until Congress acts in reference to their inter-State relations, the State may exercise all the powers of government over them, even though in so doing it may indirectly operate upon commerce outside. * * * * It is not everything that affects commerce that amounts to a regulation of it, within this meaning of the Constitution," *Munn v. Illinois*, 94 *U. S.* 113.

The interpretation by Judge Turner of the statute, to the effect that it does not prohibit the possession within the State of game lawfully taken without the State, is met by a similar array of authorities The New York court, in *Phelps v. Racey*, had under consideration a similar statute, and held that the language of the statute was plain and unambiguous. "Hence there is no room for construction. It is a familiar rule that when the language is clear courts have no discretion but to adopt the meaning which it imports. The mandate is that any person having in his or her possession between certain dates, certain specified game killed, shall be liable to a penalty. The time when or the place where the game was killed, or when brought within the State, or where from, is not made material by the statute, and we have no power to make it so." And similar to this was the construction given to the Illinois statute, in the *People v. Magner*, where the court said: "But, it is argued, this cannot be the correct construction, because such a prohibition does not tend to protect the game of this State. To this there seem to be two answers: First, the language is clear and free of ambiguity, and in such case there is no room for construction. The language must be held to mean what it says. Second, it cannot be said to be within judicial cognizance that such a prohibition does not tend to protect game of this State. It being conceded, as it tacitly is, by the argument, that preventing the entrapping, netting, ensnaring, etc., of wildfowls, birds, etc., during certain seasons of the year, tends to the protection of wildfowls, birds, etc., we think it obvious that the prohibition of all possession and sales of such wildfowls or birds during the prohibited seasons, would tend to their protection in excluding the opportunity for the evasion of such law, by clandestinely taking them beyond the State and afterward bringing them into the State for sale, or by other subterfuges and evasions."

Judge Turner cites a Massachusetts decision in favor of his construction. But the statute of Massachusetts was not like that of Washington Territory. It failed to expressly exclude or include, within the provision prohibiting the possession of game within the State, such game as was taken without the State, and when followed by a provision that possession should be *prima facie* evidence "to convict under the act," and the only penalty was a fine of $20, it could not, under the ordinary rules of construction of penal statutes, be construed in the broader sense of forbidding the possession of game taken out of the State. So far from differing from the New York decision, it cited it, and approved of the construction there given to the New York statute, which so closely resembles the statute of Washington Territory. When Judge Turner admits, as he was bound to do, that the possession of game, though lawfully taken without the State, is an offense within the letter of the act, and then admits that the statutes and decisions of other States show that it has there been considered an aid to the policy of protecting game and fish, to absolutely prohibit the having the same in possession at certain periods of the year, regardless of where the same was killed or taken, he goes far toward admitting that it is also an offense within the spirit and intention of the act. The more so, because this construction would not render the provision as to possession being *prima facie* evidence, etc., superfluous and inconsistent with other portions of the statute. In Massachusetts the penalty was a fine of $20, no discretion being left in the judge as to the severity of punishment, and the possession was *prima facie* evidence "to convict under the act." But in Washington Territory the punishment might be a fine of from $10 to $300, "or imprisonment in the county jail where the offense was committed" for from five days to three months, or both, and possession of game is "*prima facie* evidence in any prosecution for a violation of any provision of this act that the person in whose possession the same is found, took, killed or destroyed the same in the county wherein the same is found, during the period when it was unlawful to take, kill or destroy the same." When severe penalties of this kind are prescribed, it is important that the prisoner should be allowed to prove the extent of the offense committed. It might well be that a person found with game, which he could prove was lawfully taken without the State, or taken by another in the State before the prohibited season, should receive a punishment proportionate to his offense, and as crimes are punishable in the county where they are committed, this provision is of great utility in rendering it easy for the State to punish the person found with game in his possession, not only for having the game, but also for killing it, the possession being *prima facie* evidence that that person killed it in the county where it was found; and a person guilty of both these offenses, brought to trial with this burden of proof against him, could only escape through the dangerous expediency of perjury, while every person arraigned is free to prove the extent of his offense.

Section ten is therefore not only a most useful and important addition to other provisions of the statute, but is in this way capable of a construction consistent with an interpretation of the statute which shall make the possession of game an offense regardless of where taken.

In this connection, the construction given to an English statute in the case of Whitehead v. Smithers, 21 Moak, 458, is interesting. In that case dead plovers were shown to have been received from Holland by a poulterer, and it was held that their sale was prohibited by the general language of the act, Lord Coleridge saying, "I am of opinion that that argument is not well founded. It is said it would be a wrong thing for the legislature of the United Kingdom to interfere with the rights of foreigners to kill birds. But it may well be that the true and only mode of protecting British wildfowl from indiscriminate slaughter, as well as of protecting other British interests, is by interfering indirectly with the proceedings of foreign persons. The object is to prevent British wildfowl from being improperly killed or sold under pretense of their being imported from abroad."

SPORT IN THE SIERRAS—IV.

THE day following our successful hunt was spent by all our anglers upon a small stream lying some nine miles away in a westerly direction. The trout were plentiful and voracious, but small, and every one caught a surfeit of them in a short time. They would rise greedily at any kind of dark fly, and the sport soon became monotonous, as the fish were not large enough to give any play. They would average about seven inches in length, and were not very fat. The stream was fed from banks of snow, upon the highest mountain in that part of the chain, and the water was very cold. The valley it flowed through had an elevation of 7,000 feet, and fish food seemed to be scarce in comparison with the numbers of trout. The neighborhood was the home of an immense colony of marmots, dozens of which could be seen at any time sitting upright, like prairie dogs at the mouths of their burrows, watching our motions.

W. and H. leave the next morning, much to the regret of those remaining. B. and myself pack our rods and lunch pail into the buggy, and start for the lake where L. the fisherman dwells, being assured that we can there capture some large trout. L., having been notified of our intention, meets us with his boats and takes us to the fishing grounds. He assures us that no trout can be caught only by trolling, or with bait in deep water. As he has spent several years at this spot we think he ought to know, and follow his counsel. After fishing about two hours without a bite, and exhausting my patience, I make him land me upon a long low reef of rocks which show above the water. The reef is distant about sixty feet from an island, both on the east and south, and if there are fish to be caught in the lake, ought to yield some. A tolerably stiff westerly breeze is blowing, and attaching a stiff leader and two large lake flies to my line I commence casting. A few casts and I have a rise, and no minnow either, as my bending rod and singing reel will testify. He is a fighter from the word go, and affords me some moments of thrilling excitement. At last he yields to the strain, comes gasping to the net, and is safely landed. Upon this reef I capture five trout in an hour's fishing, and I am not without one on the hook for an interval of two minutes during that time, so large and vigorous are they and such splendid fighters. B., seeing my success, gets L. to row him into shallow water, and it is not long until he has his hands full. When we cease fishing at 4 P. M. we have seventeen beautiful trout, the smallest of which is a pound in weight, and the largest not quite two and three-quarters.

We make arrangements to return next week and take a reluctant leave, as we lose the best hours of fishing by being obliged to return so early. The next two days are passed quietly, and on Tuesday the "Terror" drives B. and myself to the lake and leaves us, promising to return on the following evening to take us and our catch home. L. is true to his appointment, and is on hand with his boat, and we are soon at his cabin, situated on a small island. The cabin is built of logs, and is low with an almost flat roof, in order that the winds shall get as little surface hold as possible, as they rage here with fearful violence during winter. The elevation is 800 feet, and only the high peaks surmount the spot. The trees, mostly tamarack, are gnarled and distorted with their continuous battling with the elements, and have a white and ghostly look, from the bleaching effects of the storms and scanty foliage. The outer and colored portion of the bark is all worn off by the constant cutting of the frozen particles of snow, upon the west side of the trees; that being the point of the compass whence comes the winter storms. To-day there is a strong east wind blowing, and sport is poor. Now and then we get a rise, but so seldom that it is quite an event, and no large fish are hooked at all. We had fished over all the likeliest places until tired, and B. had ceased casting, and sat poking fun at me for prolonging a hopeless effort.

I was becoming discouraged and rather inattentive, and was casting negligently with my left hand, when, just as I started to recover the flies for another cast, a huge pair of jaws came up and closed determinedly on my stretcher. Through inattention I had carried the tip of the rod too far backward before starting to recover, and was consequently taken at a serious disadvantage. Knowing this, I struck with all my might, expecting the rod to shatter in my hands. It proved to be of staunch material and stood the shock well. The reel slips out for a moment, then stops, and the line comes back idly swaying in the wind, with leader and flies all intact; there is nothing broken only the hold of the hook—and my heart. I have been wielding a rod for five-and-thirty years, and during that time have taken many a noble trout, and can judge pretty accurately as to the weight of one when fairly seen on the rise, and if that fish weighed an ounce less than six pounds I will eat a mate to him raw and without salt. And to think that I should have one of the fairest offers of all my life just at that unhappy moment when unprepared! Brother angler, I ask your sympathy; my stock of philosophy (I never had enough to load a freight train) gave out completely under the strain. The loss of that trout is a sore spot in my memory yet, and to touch upon it makes me wince, and will to my dying day.

That was the last bite we got during the day, as the wind strengthened and blew away on into the night. A sweet sleep on fresh fir boughs tends to restore serenity of mind, and B. and I rise for an early cast. The sun is not yet up,

but is gilding the peaks surrounding us, and the blue waters are without a ripple. The sky is "deeply, darkly, beautifully blue," and not a speck of cloud is visible. The circling mountains, with every crag, tree, snowbank and outline, are reflected back to the eye from the lake's calm bosom with the utmost fidelity. Not a sound was to be heard; not even that of a trickling rill. It was the loveliest and most impressive sight my eyes ever gazed upon, and the solemn silence helped sear it in upon the tablets of memory, never to be effaced while reason holds her throne. All the adjuncts gave a silent majesty and lonely grandeur to a scene such as is given to mortal eye but once in a lifetime to see. We both gazed in enraptured silence, forgetful of time, until the sun climbed above the eastern peaks, and with his golden fingers smeared the lovely canvas. When the last touches had disappeared we both drew long breaths, and turning to each other asked the simultaneous question, "Did you ever see anything so grand and beautiful?" To which the answer of each was, "No."

So impressed were we that we involuntarily spoke for some moments with hushed voices, as if there were spirits abroad in air, and in the great silence even our whispers came back from the echoing cliffs in mournful murmurs.

But business is business, and must be attended to in business hours—likewise fishing—so we take boat and start. The morning breeze soon ruffles the water and the sport begins, and when Z.'s voice hails us to breakfast, it is tardily and reluctantly obeyed. After breakfast we have about an hour's good sport, and then the execrated east wind commences to blow again, worse even than yesterday, and we have to desist. When the time arrives for our departure the wind is so strong that we have great difficulty in rowing down the lake, but finally make it, and bid Z. good-bye for at least another year. We find the "Terror" true to his appointment, so stowing ourselves and some thirty pounds of trout in the carriage, we return, well pleased on the whole with our trip.

The following day is the one I have set on which to start on my return from the outing, but B. hangs on so hard for a postponement, and just one more day's fishing, that I yield consent, and we go to the little lake at the headwaters of our river. Since I have been here last the waters have fallen considerably and are much warmer. The lily pads have covered all the margins, and a large patch in the middle is occupied by rushes which have grown up through some fifteen feet of water. The wind is fitful and uncertain, blowing from all quarters, but from nowhere long. We row to the middle of the lake and then allow the boat to float where it will.

A few casts and I have a strike, a half-pound trout, a few more, and I catch a tartar. He is no mullet-head, but a true-born California trout; and a nobler fish never swam the water. He took the fly in about seven feet of water, and on feeling the hook bored straight down for the bottom. Then he made his first frantic rush into deep water. He was getting too near the rushes, and I had to check him with a dangerous strain upon the line, to the punishment of which he finally yields. Following this comes three desperate leaps out of water, each time shaking his head vigorously to free himself from the cruel barb, but all to no purpose, and then he seeks the bottom and sulks. A telegraphic message, sent him by a few taps on the rod with my pocket scale, rouses him again, and away he goes for the lily pads. This time I think that something surely must give way under the fearful strain it takes to turn him, but at last he gives up and comes to the surface flopping, after a few more short rushes. Aha, my fine fellow, I have you now; and soon the net encompasses his beautiful form, and he is quietly lifted into the boat. He is only a two-pounder, but what a fighter! B. is soon busy also, and for three hours the fun is fast and furious.

The trout mostly lay under the shadow of the lilies, and rose to the fly in the clear water just inside them, and when struck must be got away from the dangerous neighborhood at all hazards, as it would never do to let the fish go monkeying around among the entangling stems and leaves of the lilies. This caused the loss of several fine fish, and a few flies and leaders that could otherwise have been easily saved.

One trout, which I struck in open water, made a tremendous leap the instant the hook entered his jaw, and between the impetus of his own effort and the pull of the line, flew fully ten feet before he struck the water. All the time he was in the air he was shaking his head like a bulldog, and his whole body was quivering so that he resembled a winged creature more than a fish; when he struck the water he was free, having succeeded in shaking the hook from his mouth while in the air. I could not regret him, as he showed such originality, courage and boldness in defense of his life. We soon got all we wanted, and I put my trusty rod carefully and regretfully in its case, to take it out no more for another year excepting for needed attention. I have at least the sweet memory of a successful last day's fishing to dwell upon during the long and weary year.

And so my pleasant and health-restoring outing came to an end, and the next day saw me saying good-by to these pleasant scenes and returning to the toils of everyday life—and the torchlights of a Presidential campaign.

The trip is marked in the pathway of life with a great white stone, on which is chiselled in golden letters "Sacred to the memory of a good time." AREFAR.

California.

PRESERVING DEAD GAME.—Vicksburg, Miss., Aug. 2.—*Editor Forest and Stream:* The thought has often occurred to me that your correspondents might be able to give valuable information concerning the best way of preserving game while on a camp hunt. Here in this southern latitude, even during winter, it is a matter that concerns us to a considerable extent. Some time ago, one correspondent writing for your paper, recommended the use of paper bags closely tied to exclude the passage of air. What effect would there be to submerge game in cold water? Often the water here is nearly icy cold while the atmosphere may be at a temperature of 50° or 60° above zero. Especially is this the case with the Mississippi River, while our lakes have but a small fluctuation in temperature comparatively speaking. If there is any way that is simple, cheap and convenient for preserving game for only a few days during warm weather I would like to know what it is. Will some one or more of the great number of your readers inform me on this topic?—W. L. P.

[Why does not "W. L. P." try the water experiment and report. Coffee is sometimes used. Put in bottom of box a layer one-quarter of an inch deep of ground coffee, then a layer of the birds (drawn and stuffed with grass), then another layer of coffee, etc. Any cheap coffee will do, or even the grounds that have been used and dried again.]

WATER BIRDS OF NOVA SCOTIA.

BY J. MATTHEW JONES.

THE province of Nova Scotia, being situate so far out in the Atlantic and almost entirely surrounded by water, appears to be an especially suitable locality for noticing the habits and migrations of the waders; and there is little doubt that if observing stations were established at different points of our coast, under proper superintendence, additional species might be added to the present incomplete list.

Our coast is well adapted to the requirements of sea birds, presenting as it does in its rugged outline a constant series of harbors and inlets throughout its whole extent. Jagged and riven by the frosts of many winters, the rocks which line the shores present an appearance in every way chaotic, each fissure forming a base from whence the bladder-wrack (*Fucus*) springs, while down in the depths below, anchored by its tough, tenacious roots, the tree-like stem of the oar-weed (*Laminaria*) supports its ribbon-like fronds, which wave from side to side with the motion of the surging waters, presenting at the ebb a mass of marine vegetation so dense in places that the fisherman's boat is impeded on its course. The fronds and stems of this huge seaweed form a perfect preserve for certain species of mollusks, while at its base the mussel moors itself by silken byssus so fast that when these giant weeds of the deep give way to the fury of the tempest, animal and vegetable perish together; the former when cast upon the strand opening to the heat of the noontide sun and affording a luscious morsel for the voracious appetite of the wandering crow. In these snug and sheltered coves certain species of ducks love to congregate, fishing and diving as weather permits; while outside, and even far away on the ledges, where the foaming breakers seethe and roar, divers and sea coots ply their daily task, or rest, head under wing, sleeping their watchful sleep as they dip and rise on the rolling billows. Further out flocks of cormorants cross the bays from point to point, while the different species of gulls and terns wheel around in midair, ever and anon making a dash downward to pick up some dainty morsel which floats beneath. Companies of ring plover and sandpipers of several species congregate on the spits and beaches at ebbing tide, joined very commonly by a few stray gulls, loath to allow their diminutive fellows to enjoy by themselves the "harvest of the sea."

Thus it is in spring or autumn, but how different in severe winters, when for weeks the mercury has stood little above zero, and at times 10 to 15° below. Piled on each stretch of sand beach, from high-water mark down, are masses of ice cakes, pitched hither and thither in confused heaps, as if the ocean, glad to get rid of its icy burden, had shot its thousands of car loads of brine crust on nature's rubbish heap; while out to sea the rolling waves come continuously on, heaving and swelling with their covering of broken ice floes, on some of which may be seen the herring gulls standing as steady as sailors on a spar deck, apparently enjoying their solitary ride on the frozen deep. Perhaps it would be almost impossible to picture a more dreary and desolate scene than the Atlantic coast of Nova Scotia presents during the depths of a severe winter, and no one assuredly can appreciate it save the sportsman naturalist, who beholds it as he lies secreted among the ice floes ashore, waiting for the flocks of ducks as they wing their flight from channel to channel, or slowly worming his way through ice cracks to gain a shot at some *rara avis* to carry home to his sanctum and rejoice over as no one but a naturalist can.

The commencement of our spring migratory season in Nova Scotia, is rendered either early or late according to the breaking up and disappearance—especially in the Gulf of St. Lawrence—of the vast mass of ice which has accumulated from the shores of Labrador south to the northern portions of New Brunswick and Nova Scotia during the preceding winter. If the winter should have proved an exceptionally severe and protracted one, then the greater part of that large aqueous area will have been frozen, in some localities to a considerable depth, and the sun's rays, however powerful they may be during the months of April and May, will fail to have much effect on the mass. When, in this case, the Gulf of St. Lawrence, over which on their journey to the far north many of our waders have to proceed, is not clear of ice until the beginning of June, many flocks of geese delay their departure from our shores until instinct teaches them the "appointed time." Those migrant forms, therefore, which have been enticed to push their journey north as far as Nova Scotia by an unusually warm temperature in early March, extending its effects to the latitude of Massachusetts, and giving them every indication that their progress would not be impeded, submit to a forced detention in this province exemplified in the case of the hapless wild geese mentioned hereafter.

Of the vast number of waders which pass over the lower latitudes of the Canadian Dominion east of the Rocky Mountains each spring, on their way to the northern breeding grounds, some few thousands at least which visit our province on the Atlantic shore would seem to have left the main track and sought out a tedious by-way to their destination; but while the main body make the shores of Hudson's Bay and the Arctic Ocean their destination, those which pass over Nova Scotia find congenial resting places in Labrador or the interior of Newfoundland.

Before commencing the following list of the water birds of this province we must apologize to the readers of FOREST AND STREAM for the delay in its appearance. It was intended to follow immediately the "Land Birds," published in February, March, April and May, 1879, but owing to a desire to gain additional information, we have delayed preparing it from year to year, but now beg to offer it as complete as possible to the present date, 1885. The nomenclature employed is that of the old Smithsonian list.

We must not omit to mention our obligations to Mr. Andrew Downs, the veteran Nova Scotian ornithologist, as also to Mr. Thos. J. Egan, taxidermist, of Halifax, for information regarding several rare species which have come under their observation.

GRALLATORES.

FAM. CHARADRIIDÆ.

Gen. Squatarola, Cuv.

1. Black-bellied Plover (*S. helvetica*).—Not common; arrives with other migrants from the north about the end of August and beginning of September, and goes north in October.

Gen. Charadrius, Linn.

1. Golden Plover (*C. fulvus*).—Arrives in flocks from the north about the middle of August and departs about the first week in September. This is apparently the only migrant that takes a direct course over the ocean to the West Indies and northern portions of the South American continent. We find it passing over the Bermudas generally from the 10th to the 17th of September, and they duly appear a few days later on the several islands of the Windward group. On its ocean passage it sometimes takes an extreme eastern longitude, having been observed at a distance of five hundred miles to the eastward of the Bermudas, and that in such numbers that flock after flock continued passing in a southerly direction over a vessel for several hours in succession. This bird does not visit our province in anything like the numbers it did some twenty years ago. At that time it was no unusual occurrence for Halifax Common to be the scene of much slaughter, when flocks of plover would for several days remain to be chased and fired at by every man and boy who could muster a weapon of any description. Often on a foggy day, which was especially favorable to the amateur gunners to creep upon their game, have we while driving across the open plain been unceremoniously saluted by a battery situated far too close to the road to be pleasant, and always congratulated ourselves upon escaping the hidden dangers of the course. As the weapons of these reckless pot-hunters were of the most primitive and unsafe kind, so also was the mode of carrying the ammunition, for few, if any, possessed either powder or shot flask, and contented themselves by carrying it in their trowsers pockets. As to the amount of the charge, that was immaterial; they guessed at it, and oftentimes, as a natural result, the gunner suffered more damage than the birds. How far north this bird goes to breed we know not, but they are stated to be abundant at Fort Churchill, Hudson's Bay, in July and August.

Gen. Ægialitis, Boie.

1. Kildeer (*Æ. vociferus*).—Very rare. Mr. W. Vinton observed one at Thrumb-cap, Halifax Harbor, on a New Year's Day several years ago all alone by itself, and succeeded in shooting it. It is the only specimen known to have been taken. This bird appears to be observed generally in mid-winter, and even in the Bermudas we have also found it to be the case; the months of December, January and February being those when it usually appears. Once only we found it there as early as Nov. 15. On Dec. 5, 1876, we shot one from a flock of ten which frequented a brackish pond of water on the south shore of the main land.

2. Ring Plover (*Æ. semipalmatus*).—Common on the shores. Arrives about the first week in May in small flocks, and frequents the sandy beaches at ebb of tide in search of the smaller crustaceans. They are to be seen about the beginning of August in much larger flocks preparatory to their move northward about the last of September. This species has been observed as far north as York Factory, Hudson's Bay.

3. Piping Plover (*Æ. melodus*).—Not uncommon on sandy beaches during the summer months with its young. I have observed them as early as April 29 on their northern migration, and they depart for the south about the last of September.

FAM. HÆMATOPODIDÆ.

Gen. Strepsilas, Linn.

1. Turnstone (*S. interpres*).—Very rare and only observed in winter.

FAM. PHALAROPODIDÆ.

Gen. Lobipes, Cuv.

1. Northern Phalarope (*L. hyperboreus*).—Not uncommon. Once when looking for snipe in Lawrencetown Marsh we came upon a pair of these birds at a little pool busily engaged catching small flies which hovered over the stagnant water, now swimming, then running along the muddy sides, snapping with the thin little beaks at their tiny prey. They were so tame that they allowed us to come and stand at the edge of the pool, not a yard from them at any time; and once or twice they actually came up to our feet, and on one moving only turned their heads up to look at us; the very tamest wild birds we ever saw in our life. Surely their home must be in the far, far north, away from all evil, for they have not the sense of it.

Gen. Phalaropus.

1. Red Phalarope (*P. fulicarius*).—Common. We have observed what we considered a family party of these birds, old and young, about July, while boating near the "Red Buoy," Halifax Harbor. They were very tame and allowed the boat to come close to them. They, like the preceding species, were catching flies on the water.

FAM. SCOLOPACIDÆ.

Gen. Philohela, Gray.

1. American Woodcock (*P. minor*).—Very common during some seasons. Arrives about the end of March, and may be flushed at times in the spruce woods when deep snow lies upon the ground. In certain parts of the province it occurs during September and October in abundance preparatory to its migration south, and a bag of six to ten couple may be made by a fair shot in a few hours. It is stated by some of our old sportsmen that fifty or sixty years ago this bird was comparatively rare, and that it is only since the country became more settled and cultivated that it has increased in numbers. We have never yet found the nest of this bird, but as we always flush the young brood in rough thickets, we have reason to believe it is in such places they breed. They are rarely found in their usual localities after the middle of November, and only one instance is on record of the bird having been seen in mid-winter, viz, at a spring of water in the woods bordering on the Margaret Bay road, a few miles from Halifax, on New Year's Day, 1881.

Gen. Gallinago, Leach.

1. American Snipe (*G. wilsonii*).—Common. Although fairly abundant previous to their departure south, in some favorable localities, yet the bird is nothing like so numerous as it was twenty years ago. It generally leaves the marshy tracts about the first week in October, but a few stragglers may be flushed as late as the last week of that month. It is somewhat strange, yet nevertheless a fact, that the snipe must on its migration north from its winter haunts in the south, pass over a wide expanse of ocean, for every spring visits the Bermudas in greater or less numbers. In the month of April, 1860, we well recollect a day's snipe shooting we had with two friends in Pembroke Marsh, when the birds were so thick that half a dozen would rise at every step, and on the guns going off, up would get wisp after

wisp in all directions, until the air was positively filled with them. We blazed away to our heart's content as fast as we could load and fire, sent a messenger for more ammunition, and after that was exhausted, had to give in, not from want of birds assuredly, but from want of desire to become wholesale slaughterers.

Gen. Macrorhamphus, Leach.

1. Red-breasted Snipe (*M. griseus*).—Common from the middle to the end of September, about muddy flats of the shore marshes, sometimes occurring in great abundance.

Gen. Ereunetes, Ill.

1. Semipalmated Sandpiper (*E. pusillus*).—Abundant.

Gen. Tringa, Linn.

1. Least Sandpiper (*T. minutilla*).—Very common. Frequents the mud flats of the shore marshes, in company with pectoral sandpipers and others, from middle of September to beginning of October, when nearly all depart, but a few stragglers remain as late as Nov. 1, if the weather be mild.
2. Pectoral Sandpiper (*T. maculata*).—Very common, associating with the preceding species.
3. White-rumped Sandpiper (*T. bonapartei*).—Common.
4. Purple Sandpiper (*T. maritima*).—Common. Arrives and departs with the other beach birds.
5. American Dunlin (*T. alpina*).—Abundant on sandy beaches and mudflats in August and September. We have observed them on the beach at Lawrencetown, Halifax county, as late as the middle of November, and specimens shot were exceedingly fat and were in partial winter plumage.
6. Curlew Sandpiper (*T. subarquata*).—Very rare. One specimen only has occurred, which was procured in Halifax market by Mr. Downs in the fall of 1883.

Gen. Calidris, Cuv.

1. Sanderling (*C. arenaria*).—Common.

Gen. Limora, Briss.

1. Hudsonian Godwit (*L. hudsonica*).—Very rare.

Gen. Totanus, Bechst.

1. Willet (*T. semipalmata*).—Very rare. One was shot at Eastern Passage, Halifax Harbor, in May, 1876. Mr. Downs has a specimen in his collection.
2. Greater Yellow-shanks (*T. melanoleucus*).—Abundant. Generally appears in spring on our shores about the last week of April, and arrives on its migration south about the middle of September, keeping in large flocks about the mudflats and marshes.
3. Lesser Yellow-shanks (*T. flavipes*).—Abundant. Appears on the northern and southern migrations about the same time as the preceding species and frequents the same situations. It has been observed as far north as Fort Churchill, Hudson's Bay.
4. Solitary Tattler (*T. solitarius*).—Not common.

Gen. Tringoides, Bonap.

1. Spotted Sandpiper (*T. macularius*).—Very common. Nests about the grassy slopes on the shores of inlets, lakes and rivers.

Gen. Numenius, Linn.

1. Long-billed Curlew (*N. longirostris*).—This species, which formerly was quite common, has now become exceedingly rare.
2. Hudsonian Curlew (*N. hudsonicus*).—Not uncommon during August and September.
3. Esquimaux Curlew (*N. borealis*).—Rare.

FAM. ARDEIDÆ.

Gen. Ardea, Linn.

1. Great Blue Heron (*A. herodias*).—Common. Generally appears about the last week of April, frequenting the lakes and rivers in all parts of the province. Breeds.
2. Great White Egret (*A. egretta*).—Very rare. A fine specimen was shot at Tuft's Cove, Halifax Harbor, about twelve years ago in the month of September, about the time of the equinoctial gales.
3. Little White Egret (*A. candidinima*).—Very rare, occurring at intervals of a few years in different parts of the province, generally after severe southerly gales.
4. Little Blue Heron (*A. cærulea*).—Very rare.—A specimen of the young in the white plumage was shot at Cole Harbor, Halifax county, lately, and preserved by Mr. Egan.
5. Green Heron (*A. virescens*).—Very rare. A specimen was shot at Sambo Island, at the entrance to Halifax Harbor, in the spring of 1883.

Gen. Nyctiardea, Scains.

1. Night Heron (*N. grisea*).—Rare. Formerly it was observed occasionally, but of late it appears to have nearly deserted the province.

Gen. Botaurus, Steph.

1. Bittern (*B. minor*).—Very common. In spring it generally appears in the marshes and other wet localities about the last week of April, and continues to frequent the same places until the middle of October, when it goes south. Breeds.

MALE AND FEMALE GROUSE.

Editor Forest and Stream:

"Special's" reply to my note (in the issue of Aug. 7) has more than repaid me for writing it. Now I am not an "expert as 'Special' is" (Shakespeare), but I should like to tell a very short story.

This spring, early, I had on hand two very fine adult specimens of the ruffed grouse, and hoped and believed they were of opposite sex. Not being at all sure, however, I invited two of our leading sportsmen to inspect them. After a careful look at both birds, the gentlemen "unanimously" agreed that one of the birds was a male and the other a female. Both were old hunters and had been familiar with the ruffed grouse from boyhood, and the matter seemed conclusively settled. But subsequently it was established beyond any possibility of dispute that both these birds were hens.

No insinuations, Mr. Editor, and no depreciating "Special's" ability to discriminate between the sexes in grouse—merely that it is very difficult to determine "which is which."

JAY BEBE.

TOLEDO, O., Aug. 8.

Editor Forest and Stream:

That the cock grouse sits and upon occasion takes charge of the brood, there is little room to doubt. I have never observed these birds, but I have often observed the quail (Bob White), and I know that the cock often takes the place of the hen bird, and I know of no reason why the cock grouse should not do the same thing. Every sportsman who has had occasion to carefully notice the habits of the quail will concur with me. It is by no means a new thing. The cock will sit upon the eggs and take care of the young. This is particularly the case if the hen bird happens to be killed or caught by a hawk. Hence the special reason why the cock should never be killed out of season. If the hen is destroyed, the cock will invariably take charge of and bring up the brood. I have often seen the young birds in charge of the cock only. On one occasion I saw the cock on the nest. It was last summer. I had some puppies following me and in the weeds they pointed. On going to the point, a hen bird flushed and flew off some fifty or seventy-five yards. The puppies immediately pointed within three feet of the place from where the hen flushed. On opening the grass I saw the cock sitting on the nest. I flushed him, and found a nest containing twelve or fourteen eggs. This was by no means a singular occurrence. I mentioned it to Mr. H. H. Matlock, of Riceville, Tenn. (a very well-informed sportsman), and he said he had several times found the cock on the nest, with the hen near by, showing that these birds "spell" each other in the maternal duties.

AH-PE.

MADISONVILLE, Tenn., Aug. 7.

THE PILEATED WOODPECKER.

Editor Forest and Stream:

This bird, as a rule, is solitary in its habits, and frequents the depths of our forests, breeding generally on or near their borders in the body of some old tree or stub, well removed from the habitation of man. However, there are digressions from this habit. I once saw the hole of one in the body of a large oak within fifteen rods of the cabin of a hunter, who had cleared and cultivated a small patch of land on the banks of the Cass River, Tuscola county, Mich. I was informed by the proprietor that a pair of "woodcock" had nested here for three seasons, and after the brood was out, the female left with the young, and was not seen again until the following spring; but during this interval the male bird remained in the vicinity, and could be heard or seen almost daily. Hardly a cold winter evening but his cry was heard from the forest as he approached the tree containing his nest in which he passed the night.

While stopping with the hunter in his cabin during November and part of December, of 1865, I had an opportunity of noticing the ways of this singular bird. Almost every evening as the sun was setting, I could hear his distant call, and placing myself within good range, I could see his approach as he made for the hole of the nest, which he would enter without seeming to touch the tree. Then he would turn, poke out his head in a scrutinizing way, take in the surroundings for a moment, and retire for the night. No amount of pounding on the trunk of the tree or striking the entrance to his nest with a rifle ball could make him leave, and it was but seldom he would favor us even with another sight of his head.

At the lower end of this clearing stood a large white oak stub five feet in diameter and some forty feet in high, killed by the girdling axe. From within five feet of its base to the very top the trunk was scored and dug out by this pair of birds for the grubs it contained. Around it was a pile of chips, sufficient to make two good cart loads, the result of their labor. I gathered some on the surface of the pile that measured from one to two and a half inches in length, by one-half inch in thickness; each of these chips showed from two to four marks of the stout bill that chipped them off. The proprietor informed me that this tree was the daily resort of these birds during the breeding season, and that one or both could be seen making their trips back and forth from it to their nest, carrying the food they had hammered out for their young. On digging into the chip pile I found the lower portion much decayed, resembling rotten saw-dust, good evidence the birds had been to work on the tree some years as I had been informed.

I once had an opportunity of observing a small pileated woodpecker searching for food in a hard maple tree killed by fire. The excavation made by him commenced within three feet of the ground, was six inches wide by eight inches in depth, and extended up the tree spirally eighteen feet. Each blow of the bird's bill was as deliberate and slow as the ticking of old Grandfather's clock. About every fourth or fifth blow and out would come a chip, and if by chance it missed the side of the excavation it would fly quite a distance from the tree. When you consider the hardness of this wood when dry, it seems almost incredible that so small a bird with so little effort could deal such tremendous blows. A section of this tree with specimen chips is now in the museum of the Kirtland Society.

In the Ohio State Zoological report a pileated woodpecker is mentioned as visiting the roof of a church in the early days of the city of Columbus, and was shot while hammering on the roof of that sacred edifice. If they had only known the bird was making melody for his lady love and meant no desecration, probably they would have spared his life, but there were more of them, for the account goes on to state, "Old citizens smile as they tell of the fun they had, trying to kill with a stick these birds, which frequented the trees on the grounds of the first school house."

Three years ago this spring a pair of strange birds frequented the orchard of a friend who lives in the rather thickly settled portion of the eastern part of the city. From the vague description given of these wonderful birds I was induced to make a visit of exploration to the neighborhood. To my surprise I found a pair of pileated woodpeckers had favored my friend with their company. On further investigation we discovered in an immense old locust tree, not twenty rods from the house, a nest hole well under way, which, as I learned afterward, was finished by them and in which they raised their young. Before leaving my friend I had the pleasure of seeing the cock bird fly to a flagstaff on the gable of his house and drum out a merry racket on the stick. My friend rather complained of this as a nuisance, as he remarked, "Every morning before we are up, and many times during the day he keeps up this infernal noise." But when I informed him 'twas the love call of the bird with which he chose to charm his mate, my friend laughing, and doubting, I suppose, agreed to submit and not shoot his strange visitor.

I am informed by Capt. B. A. Stanard, of this city, that a pair of pileated woodpeckers wintered about Fort Wilkins, Copper Harbor, Lake Superior, in the winter of 1844. How much further north is this bird found at this season?

DR. E. STERLING.

CLEVELAND, Ohio, July 11.

Editor Forest and Stream:

An item relative to this species appeared in the issue of July 23, 1885, but had direct reference to the *Hylotomus pileatus* or black woodpecker, log cock or pileated woodpecker, and not to the *Campephilus principalis*, which "Keouk," however, claims is found in Pennsylvania in many counties. A series of items have of late also appeared, in which it is claimed that the bird is found in Iowa and other northern sections. The mistake has been universally made in these instances, the common black or northern pileated woodpecker being mistaken for the ivory-billed species, which is an exclusively southern species, which rarely, if ever, straggles as far north as 40° north latitude. It is thought proper to rectify this error, as very many readers of your paper are misinformed on the point. One writer states that the ivory-billed woodpecker is common in Vermont. Of course, he has reference to the northern black woodpecker which is found almost throughout the United States, though much more abundant in the North.

SCOLOPAX.

RANGE OF THE MOUNTAIN GOAT.—*Editor Forest and Stream:* Some months ago I noticed in FOREST AND STREAM a note by Mr. S. Garman stating that he had seen a white goat which was killed in the Freeze Out Mountains, near the Shirly Basin. There appears to have been an error of identification in regard to this specimen. I saw it, or rather its head, in Mr. Garman's camp, and may say that it was a female mountain sheep, *Ovis montana*, and not *Aplocerus columbianus*. I have lived in the region spoken of by Mr. Garman for some years, and have hunted through all the neighboring mountains, but I have never seen a white goat there, nor has diligent inquiry among hunters been able to elicit any information in regard to this species. It is possible that it may occasionally occur as a straggler, but even this is to be proved. It may be suggested that in winter and spring the mountain sheep is very nearly white and it is possible that the color of his specimen may have misled Mr. Garman.—W. H. REED (Shirley Basin, Carbon county, July 31). [See some notes on this subject in a paper in our shooting columns.]

THOREAU AS A NATURALIST.—*Editor Forest and Stream:* Your correspondent "V." need not hold up Thoreau, the so-called poet-naturalist, as an example. We all admire Thoreau's writings for their simplicity and pleasing descriptions, but in no way does he compare to the enthusiasm of others who make birds their life study, and whose untiring work has advanced our knowledge to a degree which would never have been attained by a hermit who did not collect specimens, but rather wrote of birds with a sentimental taste, and not with strictly scientific insight.—SCOLOPAX.

RECENT ARRIVALS AT THE PHILADELPHIA ZOOLOGICAL GARDEN.—Two indigo birds (*Cyanospiza cyanea*), one opossum (*Didelphys virginiana*), two golden-winged woodpeckers (*Colaptes auratus*), one screech owl (*Scops asio*), one orange-winged amazon (*Chrysotis amizonica*), one blue heron (*Ardea herodias*), one peacock (*Pavo cristata*), six mallard ducks (*Anas boschas*), three alligators (*Alligator mississippiensis*), one hog-nosed snake (*Heterodon platyrhinos*), one coon snake (*Coluber guttatus*), one fallow deer (*Cervus dama*).

DAYS WITH THE QUAIL.

A STORY OF MID-WINTER SPORT FOR MID SUMMER READING.

MY friend and sporting companion, Brother Duffrey, who is a clergyman and "sliding elder," is so occupied with his ministerial duties that he cannot always find time to indulge his fondness for the healthful sports of the field. When he does amuse himself in that way it is during the intervals of his somewhat arduous labors. He is a native of one of the central counties of this State, and many of his near relations still reside within its borders. Much of the cultivated land being devoted to grain, and the climate being favorable, there are usually quite a large number of birds to be found in the fields; and when Bro. D. visits his kinspeople he makes it convenient to take along his 14-bore and his setter dog Bob, with the view not only to relax his mental strain by outdoor sports, but to provide his friends with an acceptable addition to their stock of provisions. But as stated he cannot go on these jaunts except when his official duties will permit, and hence must set his time according to the superior demands of his calling. When the day comes he goes then or not at all. He must run all hazards of untoward weather, and if unfortunately that is not propitious, he must do "the best his circumstance allows."

During our last visit to Chatham county it so happened that Brother D. could not make it convenient to go to the home of his brother Joe, who lives on Hickory Mountain, ten miles west of Pittsboro. Accordingly he determined to make arrangements so that he could pay the desired visit. He gave Teceel, Mud and myself due notice of the day which he had set for the proposed journey, and invited us to join him. Mud, as usual, was undecided. He was promptly told that he must "now say it, or forever hereafter hold his peace." He higgled still, and was then informed that another party was ready, and the quartet was completed without him. Poor fellow! He was sadly chagrined, but he got exactly what he deserved. But I have consoled him somewhat by telling him that if he would say yes without hesitation, he might go with me on my next hunt, provided he would take with him for training and practice my young setter Eck Galloway. He said it. "There is life in the old land yet."

Monday night, the 9th of February, was selected as the time of our departure, and at "the hour o' night's black arch the keystone" Teceel, Brother Duffrey, Crickett of Saint's Rest, and I, were at the railway station, duly "armed and equipped, as the law directs." Teceel had his 16-bore and his dog Joe, Duffrey his 14-bore and his dog Bob, Crickett his 12-bore and his dog Jack, and I my 14-bore (Lucy Green by name) and my pointer Argo. He is exceedingly diminutive in size, with an undue abbreviation of tail. The weather was rather warm for the season, but soon after our arrival at Sandford, early the following morning, the wind changed its course to the northwest, and the thermometer dropped below the freezing point. By a previous arrangement our old friend, Mark Bynum, who lives about five miles north of Deep River, in Chatham, and fourteen miles from Sandford, had a covered wagon sent for a part of the sportsmen, and the vehicle was ready for us soon after breakfast. Crickett and I got in and bade our genial and generous host, Page, and Teceel and Brother D. farewell. These two were to wait until the afternoon. What a ride we had! "The wind blew as twad blown its last," but the canvas cover on the road wagon sheltered us to a great extent, still, it was un-

pleasant. After a jolting trip of several hours we were cheered by the appearance of the hospitable house of our old friend, and his smiling face as he bade us welcome to all the comforts it would afford. He was heartily joined in his kind reception by the other members of his family, and after enjoying the delights of a blazing fire of oak and hickory wood we were invited to the dining room, where the madam had spread, for our especial gratification, an abundant and well prepared dinner, to which my rattling friend Crickett and I paid our most devoted respects. It was understood, before we left Sandford, that Brother D. and T. would join us at Mr. B.'s on Thursday or Friday and help us range the fields in that locality.

Notwithstanding the cutting wind still blew its icy blasts, Crickett and I concluded that we could brave it all and try to get a few birds for the family's morning meal. Our dogs were keen enough for the sport, and doubtless enjoyed it far more than we did. It was too cold for us, and the sharp wind kept my eyes suffused with tears. We found very few birds, and when "the evening shades prevailed," and we entered the dwelling, our bags showed only sixteen birds as the reward of all our labor and exposure. We stood exactly even in the number of our trophies. Being tired and hungry, we welcomed the blazing fire and the opportune announcement that supper was ready. Our hostess was not offended at the way we complimented her victuals. After we had tried the coffee, the sausages, the butter, and the excellent milk, we went back to the parlor, where "Uncle Mark" and Crickett smoked "the pipe of peace," while the latter entertained the household with his side-splitting recitals and laughable oddities. We did not sit up late. That is, at least, not my habit. About 9 o'clock we were shown to our room, and wrapping the blankets closely around us, we were both soon asleep and snoring. At all events, I heard Crickett in some of his choicest serenades, and did not deny that I had afforded him an equal degree of a similar entertainment.

Next morning, by sun-up, we were out of our warm beds and sitting before a comfortable fire. The thermometer was 12° above zero. We sometimes have it colder than this, but it has not been so during the present winter. The change, too, was quite sudden, and, therefore, we felt it the more sensibly. But as we had come to hunt, we resolved to try it, notwithstanding the difficulties to which we knew we would be subjected. Soon after we had partaken of a most substantial breakfast, Crickett and I, with Tommy, our host's youngest son, left the house for a trial of the fields on the upper waters of Cedar Creek. Tommy had his 12-bore and his old setter Vance. This dog was named after "Our Zeb," who is a Senator in Congress. Birds were not abundant, and at 1 o'clock, when we stopped on the sunny side of a hill for lunch, Crickett had twelve birds, Tommy eleven and I only six. After resting a while we resumed our walk, and when we got to the intersection of Munn's Branch with the creek Crickett had thirteen, Tommy thirteen, and I had seven. Tommy had gotten over the creek. After I had vainly hunted a piece of ground where I thought I would find birds and had started up the branch on my way back home, I heard the euphonious voice of Crickett calling to me and telling me that Vance had found a covey. I decline to walk back with the prospect of getting not more than one shot, and suggested that he join me. This invitation he declined, no doubt thinking that Tommy, who knew the country, could take him to better sporting ground than I could.

Leaving them to enjoy all they could get, I whistled up Argo and was "alone in my glory." I had not gone more than three hundred yards before my little dog was at a point. Going up I flushed the birds, and got one with my first barrel. The second one was unsuccessful. I followed the covey into the woods and wasted two shells at them. Going on for some distance another was found, and out of this I got two birds and missed three. I ought to have killed four. Waiting a while for my late companions to come up, and seeing nothing of them, I went forward. After traveling about a quarter of a mile I reached a sedge field of about ten acres, and my active little dog quartered it most elegantly on the leeward side. Not far from the northestern corner he came to a stand, and I got one bird with each barrel. Following up the covey, I bagged two more and then left the pursuit. About one hundred yards from where my dog found these birds he struck scent again, and after some nice working he located them. With my first barrel I dropped two birds and badly wounded another, which fell, but I did not find it. The second barrel "made the feathers fly," but that was all. Going to where they settled, I killed one and missed one. Then I bagged another and gave up the pursuit.

Crossing the highway near the old Dowdy Spring, I entered a stubble field bordered with sedge, and as I was walking up a drain, I saw a covey flying which my dog had evidently flushed. Where they alighted I could not tell, but when I got on the crest of the ridge my dog met me, and immediately went in the direction the birds had flown. In a short while he was still. I went up and killed with the first and missed with the second barrel. I ranged through the sedge and bagged four more birds. As it was getting about sundown, it was quite cold, and the house was more than a mile off. I gave up the hunt for the day, and slowly plodded my weary way, to find comfort within its inviting walls. We all reached the piazza about the same time, and on emptying our pockets, Crickett and Tommy had thirty-one birds and were even, while I pulled out twenty-three. I have no recollection of having ever in my life a larger bag. Now let no one laugh at the score which I made, and especially such as give "roseate hues" to their own performances. I, at the very least, was pretty well satisfied with the result, and this satisfaction was partly owing to the fact that I was ahead of Crickett, who is no mean handler of a gun. Tommy, too, can make many a braggart cower when he gets him into the field.

The following day was still unpleasant, and unfortunately we selected unfavorable grounds for our tramp. The walking was extremely tiresome, and the birds could not be found. At night Crickett had eleven, and Tommy and I seven each. Soon after geting home and enjoying our supper, we all repaired to the family sitting-room and indulged in conversation, each one doing his best to add to the pleasures of the others. Crickett enlivened the assemblage with his "queerest stories" and laughable mimicry, in both of which he is *primus inter pares* in our section of the country, while I endeavored to please them by reading a copy of the FOREST AND STREAM, which contained the incidents of a holiday's hunt, in which C., Mud and Brother D. were prominent characters.

The next morning the ground was white with snow, and all the shrubbery and forest trees were clad in the feathery habiliments. My hopes for field sports vanished, and I devoted the day to reading Dr. Edward's "The Old Log Meeting House," but Crickett and Tommy concluded to try the field. Tommy, being out of shells, took Lucy Green with thirty loads. Doubtless they had some fun, but whether it compensated for the labor given I am unable to say. They brought back a few partridges and doves and several rabbits. Tommy reported that Lucy was an elegant little companion which he would be willing to call his own for several years to come. Late in the afternoon a covered wagon drawn by two mules came to the gate, and out got Brother Duffrey and Teccel. The "Old Log Meeting House" was laid aside, half read, and I listened for their report. Alas! with all our toil, they took the badge. Crickett was sadly hurt, but I am accustomed to it. We sat up later than usual, and when we got into our downy couches we slept well until the morning.

After breakfast it began to sleet; but we were obliged to go. An open wagon was the only chance, and in this we got, wrapping ourselves as well as we could. Just before we reached Egypt, on the south bank of Deep River, the snow fell rapidly. We were cold enough when we placed our luggage in the railway station, and a sparkling fire in Mrs. Robinson's store near by was quite acceptable to us. A half hour afterward the whistle of the locomotive was heard, the train drew up, Conductor Campbell's pleasant face was seen, the baggage was stowed away, the dogs placed in comfortable quarters, and we left for Sandford. Our good friend Col. Page greeted us with a cordial welcome, and very soon we were sitting at his round table, turning the wheel on which the dishes were placed, and helping ourselves to one of those substantial meals for which his wayside inn is noted.

We took the "way freight" at 2 o'clock. When we called for our bills our host informed us that they had been paid, and always would be when we were on a hunting expedition. All we could do was to request him to thank our generous friend and give him a dozen fat birds as a partial payment for his kindness. At 7:20 we were at Hamlet, the junction of the Raleigh & Augusta and the C. C. Railways, and soon thereafter in our own vehicle on our way to our homes. These met us by appointment, inasmuch as we did not wish to remain at the station until 2 o'clock the following morning. At 10 o'clock we were all in bed and enjoying that sweet repose which always follows a day of hardship.

Notwithstanding the unpleasantness of the weather and the scarcity of birds, we killed about one hundred and eighty, all but two dozen of which we left with the people on whose lands we hunted. WELLS.

ROCKINGHAM, N. C.

HUNTING THE MOUNTAIN GOAT.

WELL, here I am again! I wonder what brings me up to this one particular peak each season. It is not that the trip is an easy one, nor that game is more plentiful than on other mountains nearer home. This time I started out with no particular objective point, but as we rounded the end of the island and I caught sight of the summit of Yo,* memories of pleasant camp-fires up there, of former hunting scenes and old companions, came trooping up from the past, and I involuntarily stopped paddling, laid my paddle across my canoe and looked long and wistfully up the rugged side of the mountain. Whether I made any sign to the silent savage, who sat in the stern and guided our course, I do not know, but my reveries were suddenly broken by the sound of our little dugout grating on the rocky beach at the mouth of the mountain torrent up whose side we were soon toiling.

It has always been a mystery to me, and many a time while exploring the depths of these northwestern forests, I have sat down to study out the problem, why it is that animal life is not more abundant in this, its apparently natural home? I speak now more of birds. Do birds follow civilization? And has not man in more ways than one much to do with their distribution? Why is it that at this particular season human surroundings are jubilant with the warble and chatter of countless migrants, while these vast forests are as silent as the grave? Even the few representatives of the bird world which are met with here are as weird and mute as their surroundings. A varied thrush darts from a pile of rotten rubbish just ahead of us, alights for a moment, looks back with a wild startled glance and then disappears in the gloom. And as we stop to cook our midday meal, silently, without sound of voice or wing, a Canada jay comes drifting out from the spectral trunks of giant firs, like a shadow from another world.

The day was fearfully hot, and although I had taken the precaution not to hamper the Indian with a heavy pack, night was nearly on us when we reached the summit of the lower peak. Yo is a mountain with two peaks, which stand north and south from each other, separated by a distance of about seven hundred yards; and on the southern peak, which is the higher by about three hundred feet, snow remains the year around. The ridge connecting the peaks, which is nowhere more than fifty yards wide, is made up of a series of benches, which drop gently down from the lower peak, then ascend rather sharply till the summit of the higher one is reached. The western side of the mountain is quite rugged and bare of timber for a long way down, and on this side the whole length of the ridge breaks off abruptly, leaving a sheer descent of nearly a thousand feet, when other benches and ridges are met, which lead up to other peaks or slope away to the valley of Seamour Creek. On the eastern side the mountain is timbered to within a few hundred feet of the summit; the slope is gradual and the ascent not at all dangerous, but much of the way it lies through an infernal network of bushes, which tells sorely on the muscles of the legs before the journey is ended.

When I reached the summit a disappointment awaited me. I expected at this season (May 19) to find considerable snow on the peaks, but I confidently hoped that the lower ridges and benches be at least partially covered with their usual carpet of grass and heather. Alas! over peak and ridge and bench as far as the eye could reach, was one white glistening mantle of snow. I saw at a glance that I would not be able to reach my old hunting ground over the higher peak, as no one could tell when a snow slide might occur. I moved across the summit, which is only about a hundred yards in extent, and looked down to the first bench. Two goats stood near the foot of the slope about fifty yards away. Their heads were toward me and there was nothing between me and them to break their view, but they did not show by their actions that they had discovered me.

*I trust your correspondent "Yo" will pardon the liberty I have taken in giving his *nom de plume* to one of our mountain peaks. But as he has been in British Columbia, and while here, written some charming letters descriptive of our mountain scenery, and also has, in company with myself, partaken of a hunter's meal beneath the shadow of this very mountain, the liberty is somewhat justifiable and the honor not altogether an empty one.

There appears to be as much stoical indifference in the composition of this animal as is usually found in that of the average red man of the forest, and I never knew but one to show any weakness in this respect. This was one I owned myself. I got him when very young from an Indian and kept him for about three months, when he died. He became very tame and would follow me in all my collecting rambles through the woods, and the report of my gun would have no more effect on him than would the falling of a rock in his own native wilds. He could not bear the sight of a dog, and no member of the canine family could remain around the place if the goat could by any possible means drive it away. One day a gentleman came into my shop accompanied by a setter, when the goat, who had seen the pair enter, immediately followed and assumed a belligerent attitude, stepping around the room stiff-legged, his little hoofs coming down with a loud thump at every step. Finally he halted at a respectful distance from the dog, bracing himself for a last effort, the hairs on his back standing straight on end, and, with his head lowered, he seemed to say, "You just stand there two seconds longer and I'll go through you like a shot from a Krupp gun." The dog surveyed the ungainly looking specimen for a moment, then, probably considering it scarcely worth his while to notice it, lay down on the floor and went to sleep. This was a line of defense the goat was not prepared for. This dog acted differently from any he had yet encountered. It was probably a new species and worth studying. As the dog remained motionless the goat relaxed his rigid position and moved cautiously nearer until, by stretching his neck, he brought his nose within an inch of that of the dog. Just then a fly disturbed the dog's slumber, and in bringing up his paw to brush away the insect he hit the goat a sharp tap on the nose. Quick as a flash, and apparently without bending a joint, the goat sprang into the air fully two feet, and in coming down and trying to alight as far away from the dog as possible, he got tangled up in the legs of a chair, which in his hurry to get out of the room he packed with him. When he shook himself clear and looked around and found that the house had not fallen and that the dog was perfectly quiet, he put on a look of utter disgust and skulked off into a corner of the yard, where he lay down in a clump of weeds and remained out of sight until the dog was clear of the premises

But to return to the two goats. I raised my rifle and fired, killing one of them, the other disappearing over the steep side of the bench, and when I reached the spot he was still within range picking his way carefully down over the snow-covered rocks. He did not appear to be in any hurry, and I might have shot him, but calculating the difficulty of getting him up even if he stopped where he fell, I let him go.

Leaving the Indian contemplating the amount of muck-a-muck contained within the skin of the dead goat, I walked along over the snow to the end of the bench looking around for a bare place to camp. On the next bench below me and about one hundred yards away were four goats and two deer, standing pretty close together, the trim-limbed representatives of the lower altitudes appearing quite at home in the company of their shaggy-coated cousins of the mountain peaks. Dropping on one knee and resting my elbow on the other, I sighted for the largest goat and fired, killing it on the spot. This brought every head in the little band to an upright position, with every eye fixed on the smoking muzzle of my rifle and the strange-looking object on the snow above them. Again I fired, and another of the goats fell, crimsoning the white snow with its life blood. This broke up the party, the deer springing down the timbered side of the bench, the two goats going over the steep side opposite. On examining the goats I had killed, I found they had begun to shed their coat, which was another disappointment, as I wished to procure two good skins for mounting for a gentleman in the East who had written for them; so the hunt, so far as goats were concerned, was at an end.

I remained the next day in hope of securing some ptarmigan in the change of plumage, but as the approaches to the higher peak were dangerous, and I had to confine myself to the narrow strip between the peaks, I got nothing, and the following day we slid down off our snowy perch, and in the midst of a drenching rain made our way to the salt water.

The following are the measurements of the largest of the three goats, an adult male: Girth, 4ft.; length to root of tail, 3ft. 6in.; length of horn, 11in.; circumference of horn at base, 5½in.; circumference of fore hoof at bottom, 9½in.

In comparing this with measurements of those of other goats I have killed I find it to be the largest. While on this subject I reply to a question which has more than once been asked me respecting a larger species of goat than the above, that I do not know of such in these mountains, either from personal knowledge or Indian report, nor do I believe that the average weight of a mountain goat to be much over 125 pounds. My experience in this matter is in accord with the views some time ago expressed in FOREST AND STREAM by Mr. J. C. Hughes, of this Province, and Capt. Charles Bendire, of Fort Custer, Montana. The mountain goat is, however, a very conspicuous object when seen on the side of a cliff, even at a great distance, and if he gets away from your clutches, the imaginaton is apt to picture him a veritable monster. But "science is measurement," and a small pocket tapeline is a very useful thing for one to pack on a hunting trip.

As a number of gentlemen in the East have expressed their intention of visiting this Province soon, and have asked for information respecting the opportunities for hunting the mountain goat in this neighborhood, I will, with your permission, offer the following hints for their benefit.

In the first place, do not come here limited for time. You cannot here, as in the East, step out of your hotel into a steamboat or rail car and be whirled to any point of the compass you choose. You cannot even go hunting mountain goats on the hurricane deck of a mule. For the greater part of this work you must depend on your own muscle. And then, British Columbia is a difficult country to travel through; in fact that portion of it lying near the coast is simply an infernal jungle, to penetrate which will try the patience of the most experienced hunter; and much of this kind of country must be gone through before the home of the mountain goat is reached. Again, notwithstanding the fact that the climate of British Columbia is lauded to the skies, an experience of twenty-three years here has not raised my confidence in it to the betting point, and just at the time of your arrival it may be wet, cloudy weather, which will cause more or less delay, as you must have clear weather to hunt in. Indians may also be difficult to get, but this would be the result of accident, for they are generally available. One Indian for each white man, or even two Indians for three white men, is sufficient. An Indian's pack should not exceed thirty pounds, your rifle, of course, being carried by

yourself. Leave all superfluous clothing, such as hunting coat or jacket, at the foot of the mountain, and make the ascent in pantaloons and shirt, leaving yourself free at every point. I have never felt an inconvenience from cold on the summit, and have always slept comfortable, using the same amount of covering I generally use in my own house. A pair of lace boots to come above the ankle, not too heavy in the upper, but sufficiently strong in the sole to admit of being well nailed from heel to toe, shank included (square cut nails), are the best wear for the feet.

A good pair of glasses will be of great service and save much trouble in making out the position of game and the approaches to it.

Bring with you the rifle you are best used to, no matter if that particular arm has been reviled by a score of good sportsmen. If it is successful in your hands bring it along, take your own experience in this matter in preference to any man's advice. If you have no choice, any one of the first-class makes of rifles, single breechloader or repeater, and of average caliber, the advertisements of which are from time to time appearing in FOREST AND STREAM, will, in the hands of a cool hunter, be more than a match for all kinds of game found on these mountains. Although a long shot may sometimes offer itself, it will only be a matter of choice, as most of your chances will occur within one hundred yards; however, much will depend on your experience as a still-hunter.

Myself and companion, with two Indians, have left this place at 5 A. M., made the water portion of trip (15 miles) in canoe, and reached the summit of Mount Yo the same evening in time to camp. We were in light marching order, though. I have never paid more than two dollars per day for an Indian, and have hired them as low as seventy-five cents. The price will depend entirely on the demand for Indian labor at the time they are wanted. I have generally found them trustworthy, but they will impose on a stranger if he lets them. Hotel charges here are one dollar per day.

Goats are found on all the mountains in this neighborhood and probably very far north, as I have found them on the watershed of the Arctic. The term "exclusive inhabitant of the mountain peaks," can, scarcely, however, be applied to them, as during the winter months they may be shot on the borders of the streams which put into Howe Sound and the north arm of Burrard Inlet, and even in midsummer I have known them to be taken at the verge of the salt water. But there appears to be a good deal of mythical lore mixed up with the reports concerning the mountain goat, and apparently intelligent writers have with pen and pencil added their mite in this respect—testimony which will scarcely be supported by facts when the animal becomes better known. For aside from that enthusiasm which fills the breast of the naturalist when he stands for the first time before an animal in its native wilds, the student of natural history will hardly find in the habits or composition of this interesting animal in its reality material enough to form even the semblance of that mythical one so often described in print.

JOHN FANNIN.

BURRARD INLET, British Columbia, June 9, 1885.

SOME REMARKABLE SHOTS.

Editor Forest and Stream:

I will relate a very extraordinavy happening which occurred to me on a particularly adventurous trouting expedition up the Paint River, in the Upper Peninsula of Michigan. It was in June last that four of us, all jolly, ardent fishers and hunters, Will Noyes, Kit Olin, George Billman and the writer, initiated their trip. A .44-caliber rifle was taken to ward off emergencies and to use in breaking the horns of dilemmas. It was an old one that had been taken in pawn from an Indian, and not much care was bestowed upon it. Throwing it into one of our boats, the jostling attendant upon a trip over a rough lumber road, in the primeval forests, resulted in breaking off both the front and rear sights. Not disposed to be thus cheated of its use in this way, the writer practiced at a mark with the sightless gun until he was able to make a very fair score. Floating down stream one day a duck was seen approaching, flying at a medium height. The writer grasped the "blind" rifle, fired a random shot, and imagine his astonishment and the open-eyed astonishment of his comrades *en voyage*, as the fowl flutteringly fell to the water's edge minus its head. The writer had shot the head off a flying duck with a sightless rifle, thereby accomplishing a most remarkable shot.

C. L. OSBORN.

FLORENCE, Wis.

Editor Forest and Stream:

There were some woodcock taken on the opening of the season. I have heard of 27 birds taken by three different parties. One friend recently started a woodcock so near that turning to get a shot he struck the bird with his gun, knocked it to the ground and secured it. X. Y. Z.

SALEM, Mass., Aug. 10.

STILL-HUNTING THE GRIZZLY.

Editor Forest and Stream:

I see that my article in your issue of the 9th of July, discussing Mr. Theodore Roosevelt of New York in the light of a grizzly bear hunter has brought to the front several champions of that gentleman.

I do not desire to occupy your valuable space in the easy task of proving from his article in the June *Century* that Mr. R. knows more about some other things than he does about grizzly bears, but I simply want to say a few words in reply to those gentlemen who have come so promptly to the front in defense of the author of this grizzly bear article in the *Century* magazine.

I think I have had experience enough with the grizzly to warrant me in saying, as I did in my other letter, that he is as little afraid of man as any beast that roams the woods, and just about as ferocious as any. All wild animals, however, will instinctively cower and sulk away at sight of man, unless provoked by excessive hunger or maddened by wounds.

Your correspondent from Long Branch appears to take it very much to heart, because one whom he refers to as "your wild Western correspondent" should presume to criticise so prominent a man as Mr. Theodore Roosevelt. I do not know just how prominent Mr. R. is, but I do know that his article in the June *Century* on "Still-Hunting the Grizzly" reads more like fiction than a true report of a grizzly bear hunt. I think I understood the article about as ever yone else did who read it. I know that a perusal of the story will leave the impression on the mind of the reader that the author killed three bears, helped kill two others, while his companion killed one, as he says, "purely to his own gun," making in all six—and withal a "little discrepancy," insomuch that he states elsewhere in the article that they killed, altogether, five grizzlies on the hunt. If the author meant what he did not say, and a careful analysis of his clumsy sentences by our Long Branch friend discovers the true meaning, it is all right.

But I shall drop this grizzly subject now and say no more about it, not that I am afraid lest my neighbor, as "W. E. B." says, might shy a bootjack at me and produce a subject for the coroner's jury, but for fear I may suffer injury from another sort of Jack. F. A. M.

JACKSON, Mo., Aug. 3, 1885.

A NIGHT WITH A MOUNTAIN LION.

PINING for the pure mountain air and moved by an insatiable desire to bring down a noble buck, Fred Sheldon and I put our heads together and concluded to take a jaunt by which we could attain our desire. As we could be absent from business but a few days, our objective point was the Conejo Valley, thirty miles distant. Packing our traps in a light wagon we set out about two o'clock one pleasant afternoon this month, passing for about twenty miles through the fertile Santa Clara Valley with its thousands of acres of waving grain.

Just before reaching the Guadalasca range our rifles were used with good effect on the jack rabbits, which were numerous. One poor fellow presented a ludicrous appearance in vanishing with but one ear, the bullet cutting the other off close to the head. While going slowly up a long and steep grade my attention was attracted to what I thought was a young steer, as there were a few cattle grazing near on the mountain side. I called Fred's attention to it. "Why of course that's a deer, a big buck, too." We rode along for a short distance until we found a place to tie Logan, our horse, out of sight. Taking our rifles, we went down the cañon between us and the ridge on which the deer was feeding. We separated, Fred taking up a ravine to the left, while I did the same on the right. I came up opposite the deer first, and peering over the brush, caught sight of the deer's head. Taking careful aim, I pulled the trigger and missed; but Fred, getting a good shot at the running deer, brought him down with a bullet in the region of the heart. He was a large buck, with horns still in the velvet—four points. We soon dressed him, and taking him to the wagon, proceeded on to the ranch of W. H. Reilly, where the advent of fresh venison was hailed with delight. Next morning we struck out for a camping ground, refusing the generous offer of our host to make his ranch our headquarters as long as we wished to stay. We desired to recuperate a little, and preferred sleeping in the open air under a tree, for it is seldom necessary to take a tent along while camping in Southern California. We drove about three miles below and camped near a spring of beautiful, clear water.

As a bear was reported to have been seen within a few miles of our camp, Fred was very anxious to strike out and hunt him. In fact, he was about as anxious to meet a bear as I was to avoid one. A camping experience, several years ago, in which I played second fiddle up a tree to a bear, had convinced me that in the plan of creation the relations between that animal and myself were intended to be of a very distant character.

That evening we shouldered our rifles and started in the direction of the foothills about a mile from camp. After hunting for an hour without seeing much deer sign, we began to think our chances were rather slim, especially as the fog came up from the ocean and at times obscured near objects. We went on further, however, and on coming in view of a low ridge we saw what looked like a deer's head through the fog, yet it seemed much too large. On looking a second time we saw something move beside it and discovered our mistake. There were two deer and they were watching us. Being about two hundred yards away, we didn't care to risk a shot, so we played a trick on them. I sneaked back the way we came, leaving Fred for them to watch. And they watched him, too, and forgot all about me. I came up behind them and got within about seventy-five yards. When I fired it puzzled them, not knowing from what direction the bullets came. Well, I fired seven times, I'm ashamed to say, before I disabled them. One was shot too far back and was about to get away when I shot it through the heart—accidentally. The other was also shot too far back, and disappeared over the hill. A bullet from Fred's rifle struck him slanting near the eye, but did not change his course. After following the trail for nearly a quarter of a mile I caught sight of him standing in the brush on the side of the mountain, and by a long shot luckily dropped him. We dressed this buck, which was a large one, but not so large as he had looked to be through the fog, and with but little trouble dragged him to the foot of the mountain. The other deer was a medium sized spike buck. We set out for camp a mile distant and hitching up Logan drove to the spot where we had left the game, and loading them in the wagon drove to camp two hours after we had first left it. No one could have wished for an easier way to get deer than we did those two. That night as we slept under an oak tree we could hear the coyotes near at hand attracted by the smell of fresh meat, and occasionally from afar we would hear their howls long drawn and blood-curdling so far as I was concerned. The rascals seem to possess the power of throwing their voices. One ventriloquistic coyote will throw his voice until it appears as if a dozen were in the neighborhood.

We did not hunt any the next morning, but cut the greater part of the deer up into strips for drying. We hung the strips on a rope in the sun, salting them and putting on pepper to keep off the flies. To Eastern people unacquainted with our Southern California climate, it will appear strange that meat can be dried in the open air and not decay. We can here dry any kind of meat by hanging it in the sun for three or four days. We took some venison up to Reilly's and stayed the rest of the day. One of the boys at work on the ranch, Lon Bonestel, a mischievous youngster of fifteen, was continually irritating Joe Sing, the Chinese cook, without cause, until finally when he threw an aged egg at him the climax was reached. The Chinaman obtained another egg of the same kind, and, catching the boy, smeared it all over his face, washing it thoroughly. When Lon turned to us the expression on his face and the ludicrous spectacle he presented would have made a horse laugh. We roared and yelled with laughter, but Lon, witout a word, went to the horse trough and spent a full half hour in washing himself. It is needless to say he never bothers the Chinaman any more. I had always supposed Brete Harte's poker-playing Chinaman was a myth, originating in his own fertile brain, but Joe was Ah Sing's counterpart, only he didn't do as well. After the boys had won a few dollars from him he gave up in disgust, remarking, "Too muchee gluff (bluff). No sabe."

We were told at the ranch that a California lion, presumably the same one that had carried off a number of hogs last year, had taken a seventy-five-pound hog the night before. We decided to "lay" for him. We followed his trail about half a mile when we lost it. The lion had carried the hog in his mouth all the way, so we could only follow his tracks. After searching for about an hour we came upon the remains of the hog, which the beast had left after eating most of it. Prevailing on Will not to poison him, but to allow us to shoot him, we built a small platform in an oak tree sixty yards away, from which we could obtain a good view of the spot where the remnant of the hog lay. About nine o'clock we returned to the platform and waited, I think, about two hours. Then another hour. Still no lion. The moon began to rise, and I thought it must be one o'clock. I began to get sleepy. Our positions were somewhat cramped, and Fred said he would take a little stroll in the moonlight to stretch his legs. After cautioning him not to go far, I resumed my position and soon began to doze. Suddenly I was awakened by hearing a faint crackling in the bush and the sound of stealthy footsteps on the dry leaves. I was wide awake in an instant. Every nerve seemed at its utmost tension. My heart was thumping like a pile-driver as I strained my eyes in the direction of the sound. Soon I saw a long, lithe, dark form gliding through the brush, and now it came into full view. My heart was in my throat, but taking aim as carefully as possible, I pulled the trigger. I could not see the effect because of the smoke, but I heard a fierce growl that made me quake with fear as the lion tore around the brush. I didn't come down immediately. To tell the truth, I was too badly scared, but Fred, who heard the shot, came running up and put another bullet into the creature's body. One more shot finished him. After waiting a few minutes to be assured that he was dead, we cautiously approached with cocked rifles, but his glassy eyes determined the question. We took him to camp, but we were both too "nervous" to attempt to skin him until morning. I think we were excusable, too, in taking a pull at the bottle of snake bite medicine after the fray.

We didn't sleep well that night, at least I didn't, for I kept dreaming about panthers and bears. I dreamed I was surrounded by them, all ready to devour me, when one huge grizzly came and sat down on my chest, crushing me out of existence. After arising in the morning and demolishing a breakfast of fried venison, camp bread, potatoes and strong black coffee, we skinned the lion, which proved to be a male, his measurement being six feet nine inches from tip of nose to end of tail.

Well, we killed five deer on that trip and "jerked" most of the meat. We were gone ten days and found we had gained in flesh somewhat, besides having the cobwebs cleaned from our brains. It is my intention to take another trip to the mountains before the season closes.

SAN BUENAVENTURA, Cal. DE MOSS BOWERS.

THE ST. LOUIS CONVENTION.

Editor Forest and Stream:

From the large number of letters our committee have received, the indications are that we will have perhaps the largest attendance of sportsmen in this city on Sept. 29, from all parts of our country ever assembled on this continent. And as the general sentiment is for the organization of a National Sportsmen's Association for the purpose of devising means by which we can have more uniform game and fish laws throughout our Union, and more efficient means by which they can be enforced, the committee have decided to recommend that it be national instead of as originally called. And we therefore invite every club throughout our land, North, South, East and West, to send delegates. Will you please notice our last circular herein inclosed in your next issue, and oblige,

H. C. WEST, Chairman Committee.

ST. LOUIS, Mo., Aug. 8.

The St. Louis *Republican* of Aug. 5 has the following: "Flattering promises of support and attendance at the coming sportsmen's convention, to be held in St. Louis on Sept. 29, for the purpose of securing uniform game laws throughout the country, continue to reach Capt. H. C. West, the chairman of the committee appointed to arrange the affair. The scope of the gathering has now become much enlarged and the convention will be thoroughly a national one. The game dealers are seeking representation, which will be afforded them to the fullest extent, and as the action that will follow the assembly of the convention will be both vigorous and decisive it is sincerely to be hoped that gentlemen in every interest connected in any way with the game and fish questions of the day will appear and have their say before this national caucus. Word comes from New York that several of its dealers will be present, and it will be well if they are joined by those of all the other great cities of the Union.

"It is particularly desired by the committee in charge that officers of fish protecting clubs or associations will bear in mind that the object of the convention is to watch fish protection as much as that of game. It is particularly requested by all of those now officially occupied in securing a common legislation in regard to game and fish laws that all newspapers favorable to the project will lend a hand to the good work by ventilating the fact that the convention will without fail assemble in this city on Sept. 29. Reduced railroad, steamer and hotel rates are already arranged for, and all information on the subject of a visit to St. Louis for the meeting can be obtained from Capt. H. C. West, 114 Pine street, St. Louis, or from C. A. Bragg, Globe Shot Company, Philadelphia, to either of whom also should applications for programmes and circulars be addressed.

"The views on game preservation expressed last week in the *Republican*, appear to be very generally indorsed, the common feeling being that the want of a knowledge of the habits of game has led legislatures into numberless absurdities. Among these the setting back of the opening of the Missouri grouse season to Oct. 15, appears to be one of the most ridiculous. When speaking yesterday in regard to this change, that sterling sportsman and thorough naturalist, ex-Gov. Brockmeyer, remarked: 'The mere idea of such a law for Missouri is nonsense. We now have but very few grouse in the State, and if we continue such a law we are simply discriminating against Missouri in favor of other States and Territories. If we could boast of a considerable head of grouse in the State, or if we saw our way how to build up our present paucity into a generous supply, the chain of reasoning on the subject would be different, but at present the prospects are that an increased agricultural area in Missouri will constantly lessen its grouse population. Further west of us, and still more in the Southwest (the great grouse headquarters of the day) there are plenty of these birds, and they are going

to be shot and marketed whether Missouri buys one of them or not. If we don't choose to eat them the people in other States will get them all the cheaper, and all the effect of our law which makes the possession of grouse before Oct. 15 illegal, will be to keep the birds out of our mouths in order to let Eastern people enjoy them.

"The supply for Missouri has for years past cut no figure in the St. Louis market. It may also be said that grouse shot after the middle of October are scarcely worth eating, as they are then dry and hard. They are also then very difficult to obtain, as they have packed into large flights by that date. The birds are well grown in Southern Kansas and the Indian Territory by July 20, and if they are not to be marketed here until they are too tough to be a delicacy, the while they are passing us to the Eastern markets, the questions arise, of what are we here for, and who are the grouse for? In the Territory the Indians don't shoot chickens, and white men have an unwritten law which confines their sport to between July 10 and Oct. 4. After the latter date the birds are hardly considered worth shooting.'"

NEW ENGLAND FORESTS.—No one who visits the White Mountains in these days can fail to deplore the evidences of spoliation that mark the advance of civilization to their region and along the most accessible of their wooded slopes. The cry raised against the destruction of the Adirondack forests needs to be raised, and cannot be raised too loud or too soon against the destruction of the timber region which constitutes the White hills. From the crest of any of these mountains you can see only the trackless forest, and the mountain climber would confidently say that the river sources of New England had not been rudely assailed by the woodman's axe, but in numerous places, and with increasing vigor, the work of devastation has begun about the sources of the Merrimac, the Saco and the Connecticut rivers; and, if the work goes on, there will soon be a perceptible diminution of these streams, and a loss to New England industry which can hardly be regained in the lifetime of the average man. The timber lands in the White Mountain district have within a few years passed from the earlier proprietors into the hands of speculators, railroad companies, and other parties, who have no interest in them beyond the sale of the timber for the making of money. Nobody has said anything about this as yet, and comparatively few have detected it. The New Hampshire Legislature has been asleep, as usual, and the drying up of the streams which feed the busiest portion of the new world that Columbus discovered has been attributed to "the dry season," which comes usually once a year. Any one who happens to make a tour along the railroads that pass through the notches and wind around the mountains can see for himself what serious havoc has been made in the region that holds in its embrace much of what constitutes the material prosperity of New England; and it requires no stretch of the imagination to anticipate the renewal of this havoc when the lumbering season begins again. New Hampshire has the legal control of this region, but Massachusetts and Connecticut are deeply interested in the question of water supply, which the cutting off of the dense forests that hold it back will soon destroy. There are thousands of mills which, more or less, are run by these streams. There are thousands of acres of land that are made arable because these streams from the mountains and their tributaries pass through them. The water supply in Maine has been visibly affected by the incessant click of the woodman's axe, and the danger that affects the industrial life of the busiest part of New England from the use of that axe, with its adjunct, the steam sawmill, in the White Mountains, is one of the most serious questions affecting this part of the country. It has seemed to be a remote danger, but the reports of those who have visited Northern New Hampshire during the present season go to show that not a day is to be lost in arousing public sentiment against the wholesale destruction of the resources of the water supply for our agricultural and manufacturing industries.—*Boston Herald.*

LAWLESS NEBRASKANS.—*Editor Forest and Stream:* Although our season for prairie chickens in this State does not open until Sept. 1, they are being shot off already at a rate which promises to leave very few for those of us who prefer to obey the law. The season opened very favorably and the promise for a good chicken crop was excellent; but since the first of July everybody has been shooting the birds. Some of the broods are scarcely big enough to fly even now, and are, of course, utterly valueless as food; but they are killed all the same. The poachers start out with teams, concealing their guns in the bottom of the wagon, and having their fishing rods in plain sight. They announce that they are going fishing, and take their dogs along to give them "a run." When they get well out of town the "sport" begins. I am sorry to say that the district judge, the sheriff of the county and many of our best citizens are not ashamed to take part in this despicable business. It strikes me that there is a good chance for some one to do a good deal of missionary work in this part of our State.—KOOTS (Duncan, Neb., July 30).

SCRANTON, Pa., Aug. 3.—I have just returned from the Pocono Mountains. The outlook here in the Lackawanna Valley for the coming fall shooting is now inviting. Quail and gray squirrel will be plenty. Woodcock are scarce, but partridge shooting will be the best that we have seen in years. Saturday I returned from Stroudsburgh, fifty-two miles south on the D., L. & W. R. R., and I found quail very plenty. Deer ten miles from there will be numerous, and some of the old sportsmen say that they expect to have the finest deer shooting that they have had in five years. Trout fishing was fine; a string of seventy was caught two days before the law expired, and several weighed over 1¼ pounds each. The bass fishing here at Jones's Lake is good; one was caught a short time ago weighing 4¾ pounds. At Scull Pond and Mud Pond, eight miles from here, you will find as good bass fishing as can be had in this section. Sportsmen who visit Stroudsburgh this fall should stop at Mr. Derr's, who lives only a short distance from the depot. —W. B. L.

"CAHOOT."—In this locality the words "in cahoot" or "in cahoots" is a slang phrase used by the less intelligent classes to denote a partnership or conspiracy to do an illegal act, and frequently used instead of the word "partnership" in speaking of a business transaction.—R. E. S. (Newport, Ind.).

LITTLE ROCK, Ark., Aug. 4.—Game prospects are good. Squirrels plentiful. Wild turkeys unusually plentiful. I saw a large flock of young ones this morning. I think the game law is generally observed around here.—CASUAL.

THE NAME "QUAIL."—Rockingham, North Carolina.—*Editor Forest and Stream:* I wish some of your readers would tell why it is that most Northern people persist in calling Bob White a quail. He has none of the distinctive habits of the quail. He is not migratory. Bob lives and dies within a half mile of where he was ushered into this "breathing world." He does not resemble the quail of Europe in his wings, tail or head, but does greatly resemble the nut brown—sometimes called the gray—partridge, whose picture I have seen in ornithological works, and most recently in Greener's book. I protest most earnestly against the name of "quail." But I do not insist upon his being called partridge, as is universal in the South. Let sportsmen speak of him as Bob White. The quail of Europe breed in France and fly across the channel into England. Who ever heard of such a flight on the part of our bird? A half mile is rare for him.—WELLS.

SPORTSMEN'S DISPLAY AT THE LONDON EXHIBITION.—The American Exhibition, City Offices, 7 Poultry, London, E. C., July 29, 1885.—*Editor Forest and Stream:* Several English gentlemen who have made collections of souvenirs of American sport have formed a committee in connection with our exhibition of next year. Their object is to make an especial collection of skins, horns, stuffed birds, animals, etc., indigenous to our country. This will be a loan collection, and will also comprise whatever relates to the American Indians. We invite the co-operation of gentlemen in the States who have similar collections.—C. B. NORTON, Secretary.

KANSAS PRAIRIE CHICKENS.—Topeka, Aug. 4.—The quail and chickens wintered well, although we had quite a severe season. In the counties west of us they are very abundant, and will well repay a visit. A great many are being slaughtered at present, although the law will not be out till Sept. 1.—H. B.

Sea and River Fishing.

Address all communications to the Forest and Stream Publishing Co.

POSSESSION IN CLOSE SEASON.

Editor Forest and Stream:

The digest prepared by Mr. Samuels, of the various game laws so far as they relate to the possession of game illegally taken, is a valuable contribution to your paper, and now a digest of decisions relating to game taken in one State or Territory and exposed for sale in another, would be especially valuable to the game and fish protective associations of the Pacific coast. The Spokane River heads in Idaho, where there is no fish protective law, and runs across the northeast corner of Washington, where we have a law which was intended to be very severe in its protective provisions. Fish are sold in our market all the year round, and during the close season the claim is invariably made that the fish were caught in Idaho. During the month of March our rod and gun club caused the arrest of a *restaurateur* for having mountain trout in his possssion, and he was bound over to the District Court. His attorneys took the case before Judge Turner of the United States District Court upon a writ of *habeas corpus*. Judge Turner granted the writ and ordered the release of the prisoner. As the decision touches upon the subject of interstate commerce, it is of general interest, and I inclose it for publication, with the hope that it may bring forth suggestions which will enable us to so amend our law as to make it serve the object intended by its enactment. It is proper to state that Judge Turner is a sportsman as well as an able jurist, and is in sympathy with all laws for the protection of game and fish; his decision, therefore, while not in accord with his personal feelings, may be regarded as a strict interpretation of the law. G. H. MORGAN.

SPOKANE FALLS, W. T., July 1, 1885.

The full text of Judge Turner's opinion is as follows:

Ex parte, Charles Carson.

The petitioner, Charles Carson, having been bound over to the next term of the district court for the alleged offense of having in his possession mountain or brook trout at a time when it was unlawful to have such fish in possession, and being in the custody of a constable under a warrant of commitment issued by the justice before whom the preliminary examination was had, prosecutes a writ of *habeas corpus* to recover his liberty.

The constable having made proper return upon the writ, the district attorney, representing the Territory, and counsel representing petitioner, appeared before me and agreed upon the following, substantially, as the facts constituting the supposed offense, namely, the petitioner had in his possession in Spokane county, during the month of March, 1885, mountain trout which had been taken in the Territory of Idaho, and which petitioner had brought, or caused to be brought, from Idaho to this Territory.

The law which it is insisted for the Territory makes this act an offense is found in an act entitled "An act for the protection of fish and game," approved Nov. 27, 1883, Laws of Washington, 1881-3, page 102. Section 7 of said act reads as follows: "Every person who shall, within the Territory of Washington, during the months of November, December, January, February and March of any year, catch, kill or have in possession, sell or offer for sale, any mountain or brook trout, shall be guilty of a misdemeanor."

Two questions are presented for consideration upon the law and the facts: First, Does the law of 1883 make it an offense to have in possession during the prohibited season fish which were taken outside the limits of Washington Territory? Second, If the first question is answered affirmatively, is the act in conflict with section 8 Article I. of the Constitution of the United States, which provides: "The Congress shall have power * * to regulate commerce with foreign nations and among the several States, and with the Indian tribes"?

Upon the first question it is true, as insisted by counsel for petitioner, that the act of 1883 is a penal law and must be strictly construed. I understand the doctrine that penal laws must be strictly construed to be this: If the act is within the letter of the law but not within the spirit, the act is no crime. If it is within the spirit but not within the letter, it is no crime. The act which it is sought to make criminal must be covered both by the letter and the spirit of the law. Bishop on Statutory Crimes, sections 190, 220, 231 and authorities cited.

That the act of having possession of the prohibited kinds of fish taken outside the limits of Washington Territory, is covered by the letter of the law under consideration, is too clear to require demonstration. That such act is within the mischief intended to be remedied by the law, and is therefore within its spirit, is not so clear. The title of the law, which may be looked to in aid of its meaning, is "an act to protect fish and game," meaning fish and game within the Territory of Washington. The object of the law, generally speaking, is undoubtedly to prevent the improvident destruction of fish and game in this Territory. Does it follow that the prohibition against having fish in possession during certain months must be construed as relating to fish only that are taken in Washington Territory. The implication in favor of the affirmitive of this proposition would be strong if it were true, as claimed by counsel for the petitioner, that the purpose of the act is in no way subserved by construing such prohibition as relating to fish taken outside of Washington Territory. But an examination of the statutes and judicial decisions of other States shows that it has there been considered as an aid to the policy of protecting game and fish to absolutely prohibit the having of the same in possession at certain periods of the year, regardless of when or where the same was taken or killed. Game and fish of the same species is pretty much alike everywhere, and if the State in the prosecution of offenses against the game laws, must negative the taking of the game outside the State, or its taking at a time when it was lawful so to do, it would make the conviction of offenders against such laws exceedingly difficult and in some cases impossible.

This fact has led to the making of laws elsewhere denouncing the simple offense of having game and fish of certain kinds in possession at certain times of the year, regardless of the time and place when and where such game and fish was taken. It is insisted, however, that such construction ought not to be given to Section 7 of the act in question, because another section of the act completely covers the mischief which such construction would guard against. Section 10 of this act provides that "proof of possession of any of the aforesaid animals, fowls, birds or fish, at a time when it is unlawful to take or kill the same in the county where the same is found, shall be *prima facie* evidence in any prosecution for a violation of any provision of this act, that the person or persons in whose possession the same is found, took, killed or destroyed the same in the county wherein the same is found during the period when it was unlawful to take, kill or destroy the same."

This latter section entirely guards against the mischief which the first section, standing alone and restricted to fish caught in this Territory, would leave unprovided for; and the fact that the rule of evidence provided by it is general and applies as well to the offense of having fish as to that of taking and killing the same, is very persuasive that the Legislature had in mind only fish taken or killed in Washington Territory. A similar provision in the game laws of Massachusetts was considered by the Supreme Court of that State as aiding materially a construction that the prohibition in said laws against having game birds in possession at a certain season of the year did not include birds taken outside the State, or taken at a time when it was lawful to take them and preserved until the time when the taking was unlawful.—Commonwealth vs. Hall, 128 Mass. 410.

The Court of Appeals of New York, however, upon a law, the prohibitory clause of which has greater similarity to ours than that of Massachusetts, has held that their law did prohibit the possession of fish and game taken outside the State.—Phelps vs. Racey, 60 New York Court of Appeals, page 10.

The New York law did not, so far as the opinion of the court discloses, contain a provision like that contained in Section 10 of our law, and it did contain other provisions not found in our law, from which the court deduced the intention of the Legislature to include fish and game taken outside the State.

The court, however, placed its decision upon the other ground that the law of the State was plain and unambiguous, and left no room for construction. If it meant by the language used to intimate that, because the letter of the law was plain the letter must be followed, it was, in my opinion, clearly wrong. Criminal statutes will be contracted by interpretation so as to avoid punishing those who, though breaking their letter, have not violated their spirit. The following are instances of such contractions:

An act of Congress made it punishable "to import or bring, in any manner, into the United States or Territories thereof, from any foreign kingdom, place or country, any negro, mulatto or person of color, with intent to hold, or person of color as a slave, or to be held to service or labor." And this act was adjudged in the time of slavery not to be violated by carrying slaves from the United States to Europe and thence back, to be held again in bondage, because the object was to put an end to the slave trade.—United States vs. The Garonne, 11 Peters, 93.

The selling of a free negro into slavery, with his own consent, under the collusive agreement between him and the seller, to divide the proceeds, was adjudged not to be within a statute against "selling a free person for a slave, knowing the person so sold to be free."—Mercer vs. Commonwealth, 2 Va. cases 144.

A statute against stealing from a dwelling house is not violated where one steals in his own house the goods of another.—Bex vs. McDaniel, 2 East P. C., 644.

These and similar cases are given by Mr. Bishop in his work on statutory crimes, as instances of the contraction of the letter of penal statutes so as to except from their operations acts not within their spirit.

I am of the opinion, in view of the foregoing, that the act of having fish in possession in this Territory during the prohibited period, which were taken outside the Territory, is not within the act of 1883.

I have not reached this conclusion without some difficulty, and at first blush was inclined to a different conclusion. I am glad to reach it, however, because a contrary construction of the law would bring it into conflict with the constitution of the United States, and might sweep it away entirely.

It needs no citation of authorities to show that food fish which have been taken from the water and reduced to possession are personal property and as much the subject of trade and traffic as any other species of property. The act of 1883 then, which makes it unlawful to have in possession, during certain periods of the year, this species of personal property, if the construction claimed by counsel for the territory be correct, in effect prohibits the importation of such property from a foreign country, or from a sister State or Territory, as fish, dead or alive, when upon load, have no power of locomotion, it is a necessary consequence that such property cannot come into this Territory, except in the possession of some individual, and then the act of bringing the fish across the borders is made an offense.

This is a regulation of commerce between the States within the meaning of the constitution of the United States. The principles upon which the commerce clause of the constitution is to be expounded may now be considered well settled, although at the time of the decision of some of the earlier cases the members of the Supreme Court of the United States were at variance on the subject. Some of those principles, so far as they are necessary to be noticed in this connection, may be summarized as follows:

Any charge on or obstruction to the introduction and incorporation into and with the mass of property within the State of commodities from abroad, is hostile to the power of Congress to regulate commerce.—Brown vs. State of Maryland, 12 Wheaton, 419; Railroad Co. vs. Huson, 95 U. S. 465.

The right of Congress to regulate foreign and interstate commerce in all its branches and to any extent, is supreme, and as to all matters that admit of and require uniformity of regulation, the power is national and exclusive of State authority. The matters that are national and as to which the right of Congress to act is exclusive, are, among others, intercourse and traffic with foreign countries and between the States, "including in those terms navigation and the transportation and transit of persons and property, as well as the purchase, sale and exchange of commodities."—12 Howard 299; 91 U. S. 275; 92 U. S. 259; 95 U. S. 465; 103 U. S. 691.

As to matters that are not strictly national the States may legislate confessedly in aid of commerce so long as their legis-

ration does not conflict with legislation of Congress on the same subject. This I gather from the cases already cited.

The States may legislate concerning matter relating to their own internal police, even though in so doing they seriously affect foreign or interstate commerce, but whenever the Legislature of a State undertakes to exercise this police power, if the provisions of the State law trench upon the power of Congress to regulate commerce, the Courts of the United States claim and exercise the right to say whether said provisions exceed the exigency for which they have been professedly enacted.

In the case of Railroad vs. Husen, 95 U. S. 465, a prohibition against the introduction into the State of Texas or Mexican cattle during certain months of the year, was attempted to be defended as a proper exercise by the State of its police power, on the ground that such cattle were likely to introduce disease among the domestic cattle. It was urged that the State had a right to protect itself against this danger. The court, while admitting the right, held that the danger could be effectively guarded against by inspection and quarantine laws, and hence that a sweeping enactment against the introduction of all cattle, healthy or otherwise, was involved. The court in that case says: "In coming to such a conclusion we have not overlooked the decisions of very respectable courts in Illinois, where statutes similar to the one we have before us have been sustained. [Yeagle vs. Alexander, 58 Ill. 254.] Regarding the statutes as mere police regulations intended to protect domestic cattle against infectious diseases, those courts have refused to inquire whether the prohibition did not extend beyond the danger to be apprehended, and whether, therefore, the statutes were not something more than exertions of police power. That inquiry, they have said, was for the Legislature and not for the courts. With this we cannot concur. The police power of a State cannot obstruct foreign commerce beyond the necessity for its exercise; and under cover of it, objects not within its scope cannot be secured at the expense of the protection afforded by the federal constitution. And as its range sometimes comes very near the field committed by the constitution to Congress, it is the duty of the courts to guard vigilantly against any needless intrusion."

According to the foregoing principles it cannot be maintained that the act of 1883, if given the construction claimed by the Territory, is of such local and auxiliary character in its relation to national commerce that it will be valid in the absence of legislation to the contrary by Congress. The act interferes with the transit of property into this Territory, and with the purchase, sale and exchange of commodities in another Territory, matters which the Supreme Court of the United States in Mobile County vs. Kimball, 102, U. S., say are national and require uniformity of regulation.

I am aware that the Court of Appeals of New York considered this very question in Phelps vs. Racey, ruled, in connection with the game laws of that State, and held that the prohibition against having birds in possession at a certain time, and which was construed as including birds brought into the State from another State, was valid in the absence of congressional legislation to the contrary. I do not see how the case can be reconciled with the decisions of the Supreme Court of the United States. Moreover, the court in deciding that case failed to notice the distinction between matters which are of national concern and require uniformity of regulation and those that are merely local and auxiliary.

Neither can the act of 1883, construed as claimed by counsel for the Territory, be sustained as a proper exercise of police power of the Territory. The prohibition against having game and fish in possession during certain periods of the year, does not proceed upon the theory that it is immoral or unhealthy to have such game or fish in possession, but was enacted because to permit such possession would militate against the enforcement of the game laws by compelling the Territory in every case to negative the taking of the game or fish in another State or Territory. This is the only useful purpose to the people of the Territory that the prohibition can have. That purpose is fully subserved by section 10 of the act to which I have already adverted. By that section the burden of proof is shifted from the State to the defendant. The mischief, therefore, being entirely remedied by section 10, that provision which makes it an offense to have the possession of fish during a certain period of the year, must, if it covers the possession of fish taken abroad, be considered as extending beyond the necessities of the case, and therefore an unauthorized interference with the right of Congress to regulate inter-state commerce.

I do not think the citation from Bishop to which my attention is called by counsel for the Territory, militates against this position. Mr. Bishop, in discussing game laws similar to the one under consideration in connection with the commerce clause of the Federal Constitution, says: "But when they [game or fish] have been brought into the State from another State or country, and mingled with the general property, their sale, or the keeping of them for sale, may be prohibited the same as though captured or killed in the State." Bishop on Statutory Crimes, Section 1,135.

Undoubtedly when any commodity has been brought into the State and mingled with the general mass of property in the State, State laws regulating the sale or keeping the same for sale or absolutely forbidding such keeping or sale, if the public health require it, would be valid if no discrimination is made in favor of home commodities of the same kind. But the vice in our law, construed as counsel for the Territory would have it construed, is that it absolutely prevents the introduction into the State from abroad and its incorporation with other property of the State, of a salable commodity. Mr. Bishop cites in support of the proposition laid down by him several cases from State courts, and among others the case of Phelps vs. Racey, 60 New York Court of Appeals, already noticed.

The other cases cited by him have not been produced before me and are not obtainable here.

The case of Phelps vs. Racey does not support the proposition. The constitutional question was disposed of in that case upon the broad ground that the authority to regulate commerce was concurrent, and that such regulation by the States, in the absence of contrary legislation by Congress, was valid.

I think the prisoner must be discharged, and it is so ordered.

OKOBOJI LAKE.

ONE of the most pleasant places I have visited for a long time is Okoboji Lake, Iowa, in the northwestern part of the State, near the line of Minnesota. The post office is Okoboji. At a place known as Arnold's Park, there is a new hotel where I was told the rooms were comfortable and they kept a good table. In the fine groves, both at the park and other places along the beach, quite a number of tourists were living in tents. Some of those at the park took their meals at the hotel. The charge for boats, including minnow bucket and fishing tackle of a rude kind, was fifty cents to one dollar per day, according to quality. An excellent article of minnows was furnished at ten cents per dozen. The fish caught were chiefly pike, pickerel, rock bass, croppies, and a small yellow perch, from five to eight inches in length. I did not see a black bass or hear of one being taken there.

One morning while there a couple of small boys and myself took twenty wall-eyed pike, three pickerel and one beauty of a striped bass, twenty-four in all, in about three hours' work. It was the most attractive string seen while at the lake. The more aristocratic people go to Spring Lake, at which there is a handsome sheet of water and an elegant hotel, but I was told the fishing falls far behind that over at Okoboji. The two places are some nine miles apart, accessible to each other by small steamers which ply between them at regular intervals. These lakes are reached by rail from St. Paul, Milwaukee, Cedar Rapids and Council Bluffs. From the latter place they run through a special sleeper, which is side-tracked at Spirit Lake.

The last Legislature amended the game law of Nebraska so as to extend the close season for chickens to the 1st of September. No one apparently seems to be paying any attention to the law, sportsmen as well as pot-hunters indiscriminately violating it. Parties are out from here every day and make but little secret of it. The reports are to the effect that chickens are abundant; but it seems they must go. It will not be long at the present rate before the making a fair bag will be an impossible thing. BURR H. POLK.

LINCOLN, Neb., Aug. 7.

DOWELED VERSUS SIMPLE-FERRULES.

Editor Forest and Stream:

Since the union of the joints of fly-rods by the simple in preference to the ordinary doweled-ferrule was first advocated by me in your columns, I think I notice a marked change among anglers in favor of the opinion I then urged, and still advocate.

Many who then opposed the idea with greater or less vehemence, now admit that the simple-ferrule may be used in a trout-rod—some allowing that it is better, some that it is just as good, while others, faithful to their first love, still claim the superiority of the doweled-ferrule, while acknowledging that the simple-ferrule may be employed in trout-rods without the certain disaster which they originally insisted must attend its use.

But last winter when I announced to some of my angling-friends, particularly those in the trade, that I proposed to make a salmon-rod and unite its several joints with simple-ferrules, it was the old story over again. It might answer in a trout-rod, but under the severer strain of a salmon-rod such ferrules would surely split, or bend, or throw apart, and the first salmon struck would reduce my rod to a wreck and plunge me in that slough of despond into which the angler always sinks when he encounters such a disaster.

My old argument, that I had used this form of ferrule for more than ten successive years in the heavy trout-fishing of Maine without the slightest accident, and that therefore any failure which might be cited against it must necessarily be due to faulty workmanship rather than error in principle of construction, was no longer available. As far as I know a salmon-rod had never been so joined. Thus I could but answer theory with theory, and with the usual result: "A man convinced against his will, is of the same opinion still."

Pursuant to the idea that it is the duty of every angler to publish for the benefit of the fraternity whatever he believes to be new and advantageous, I now propose to give an account of the result which attended the use of this rod.

But first permit me for the benefit of the many who have joined the ranks of your subscribers since the subject was agitated in your columns, to define what I mean by the term "simple-ferrule."

A metal tube is soldered together in the usual manner. Inside of this tube a polished steel mandrel is inserted, and with the mandrel still within the tube, it is drawn through a polished hole in a steel plate. Thus the inside diameter of the tube is reduced to the diameter of the steel mandrel, while its outer diameter is brought down to the size of the hole in the steel plate. The tube is thus lengthened and made smaller, the bore becomes cylindrical and smooth, and the metal is condensed and stiffened. Tubing so made—"drawn inside and out," as it is termed in the trade—alone is fit for our purpose, and when I speak or have spoken of "simple-ferrules," ferrules made from such tubing, or tubing in which the metal has been condensed and the bore made cylindrical by some analogous process, are intended. Having obtained tubes thus made, and of the proper size, a piece of the desired length is cut off from that which is to form the outside or female ferrule, and its exterior is finished up. The interior, however, should not be touched, since it is important that the bore should remain a true cylinder, and since it is almost impossible to grind out the inside of a tube without enlarging it more at the mouth than within. The male or inside ferrule is then made by so finishing off the outside of a piece of tubing of smaller size, that it will enter the outside ferrule to such a depth that when the ferrules are in position and the rod joined, the neighboring ends of the several joints will be almost or quite in contact with one another. If the male ferrule fits its whole length, as it should, it will be unnecessary to leave any margin of insertion for wear.

These two pieces of plain tubing, so made and so fitted, constitute what I designate as the "simple-ferrule."

Should the reader infer from the length of the preceding description that the process therein described is difficult or tedious, he would be in error. Having procured the tubing from a manufacturer of that article I can easily with the aid of a lathe fit and finish the ferrules for a butt, two middle-joints, and three tips inside of an hour; and I am but an amateur without mechanical training.

The salmon-rod in question was fifteen and one-half feet long, and in three joints of equal length. The longest ferrule, that uniting the butt and middle joint, was three and one-half inches long, and all the ferrules were fitted in accordance with the principles before set forth. No device whatever was used to prevent the joints throwing apart, except the natural cohesion due to the fitting of the ferrules one within the other. The ferrules were at all times kept well greased to facilitate ultimate separation as is my practice, while the metal of which they were composed was in itself an experiment as far as this use of it was concerned, and was found so inferior to German-silver or even good brass in stiffness, that it was not without hesitation and doubt that I used it at all.

With this rod so united, I took twenty-five salmon. The largest weighed thirty-two pounds, and was gaffed only after a struggle lasting one hour and fifty minutes. One fish of twenty-six pounds was taken after a fight of one hour and fifteen minutes, which was hooked in the side about three inches back of the gill. One fish which I thought would weigh nearly if not quite forty pounds, was lost after one hour and thirty minutes play. I brought it in to the bank, but at the approach of the gaffer it rallied and made a sharp run of some sixty or seventy yards. I followed it down stream, and had gradually worked it in again until it was about thirty or forty feet distant. It was then a very sick fish, frequently rolling upon its side, as it came in with little or no resistance except what came from the friction of the water. Then the last shred of skin which held the hook gave way, and it escaped. These are the times that try men's souls—as well as their morals.

I lost another fish which I thought still larger. We had had it hot and heavy for thirty minutes, and I had worked him in quite near the bank, when down came an island of floating logs. At this inopportune moment the salmon started for the opposite shore at race horse speed, passing just below the floating logs in his course. I thrust my rod under water nearly half its length in the hope that the obstruction might thus pass over the line. But when one hundred and ten yards were out something fouled it, and a leader tested to eight pounds parted and the fish escaped.

Of the whole lot of twenty-five fish actually reduced to possession, the majority were of twenty pounds or over, besides others not mentioned above which were lost after a contest of greater or less duration. These fish were all "fresh-run," and were taken about four miles above tide-water. When I have used the term "fish," salmon are to be understood in every instance. Indeed nothing else is considered worthy of that name in a salmon stream.

This, it seems to me, is a pretty fair test of the simple-ferrule. If its principle of construction is wrong—if such a ferrule will split, or bend, or throw apart, as claimed by its opponents, these defects, or some of them, should certainly have made themselves manifest.

Such was not the case. These ferrules were as perfect in every respect when I packed my rod to return home, as when I took them from the lathe and first put them on the rod; and though no device whatever of any description was used to prevent them from throwing apart, aside from the cohesion due to their fit, not one of them ever started. Indeed I might add that within a week after my return, and without alteration or repair, I loaned this rod to a friend who was anxious to try his luck with salmon at the same place, and who, I hope, is at the moment of this writing, struggling with a forty-pounder.

"The proof of the pudding is in the eating."

HENRY P. WELLS.

NEW YORK, Aug. 8, 1885.

FOUR "BOYS" ON A FROLIC.

THESE boys were of rather ancient cast, perhaps, but, after nearly sixteen years of separation, they were again united and bound for a good time, if such was to be had, fishing and "roughing it" for an outing on the historic shores of Bristol Bay.

The Engineer had been for many years more familiar with the sand flats, bars and winds of the Missouri Valley than with the haunts of civilization and the smell of salt water. The Horse Marine had been in all of the States and Territories west of the Mississippi on the hurricane deck of a cavalry horse, looking for "Poor Lo" in his native haunts, and gradually becoming impregnated with alkali and the flavor of sage. The Wanderer had been in many lands and many climes, but more recently wrestling with the Indian in his native wilds, 'mid the snows and cold of a Dakota winter. The last of the band, the Lawyer, had stayed at home and cultivated his brain, his beard and the legal profession; to say nothing of the fine wife and baby boy that welcomed him at home. But we four were all together once more on the old stamping ground, and the programme was fun and lots of it.

During the many years that we had been separated and, alas, all grown older, the shores of Narragansett Bay had seen many changes. Where once was lonely beach or silent grove are now summer residences of greater or less pretentions, crowded in the summer time with gay parties of new comers, seeking and finding health and pleasure in their release from city life and the confining routine of business or society. Where once the Horse Marine and a party of chums used to bake the festive clam weekly on the school holiday, now stands a lofty lighthouse, and so each and every pleasant spot has been occupied in one way or another by cottage, villa, camp or hotel. The adjacent waters of Bristol Bay are similarly, if not quite so thickly occupied. Here and there, however, close under the shadow of Mount Hope, are some new places of modest mien, filled from the beginning to the end of the season with party after party of pleasure seekers. No more beautiful spots are to be found that these cosy cottages on both these sheets of water, and no more pleasant place to sail, to row, to fish, swim, bathe, in short, to have a good time generally.

It was, therefore, with highest hopes, all to be fully realized in the end, that we four packed our duffle and swung ourselves up on to the seats behind a gay and festive nag for our drive to our quarters at the Narrow. The wants of the inner and outer man had all been attended to; fish poles lay snugly in their cases beneath the seats, and grub—to speak of it in the Western vernacular—was represented by the solid comforts more than by the choice viands. The Wanderer held the ribbons and had hard work to keep order and decorum among the boys even while driving through the city. Not that any boisterous or rowdy behavior was indulged in, but were we not boys once more? And did not boyish capers, laughter, jest and song come as natural as though we were not one day over sixteen, instead of being—I dare not say how old? But after we had left the city, and were alone on the country road, all restraint was put off and the fun grew fast and furious as we talked and laughed, smoked and sang, and enjoyed ourselves as only those who are free as a boy once again can. The Lawyer's blouse pocket made a convenient receptacle for peach stones, cigar stumps and burnt matches, too; the meanwhile he was blissfully ignorant that he was being loaded up, to discover it and unload later with a string of mild expletives.

Our road lay through pleasant places; now over a hill giving us a fair view of the smiling waters of the bay, dotted here and there with the sails of pleasure craft; now through a wood fragrant with the breath of summer; now by some venerable farmhouse with its orchards and gardens of dear old-fashioned flowers; now through some pleasant village, and at last down a long hill to our destination. The whole road, or nearly all, would have been practicable for the "wheel," and would well repay any wheelman for his ride.

To open the house—a summer cottage of simplest and plainest form—to unpack, to snatch a hasty lunch and hurry away for a fish was but the work of a moment, and soon we were launching our boat and gently dancing over the smiling waves. What a contrast was this to what we had all been used to for months, yes, rather for years. The Lawyer was the only one to whom it was familiar from any late experience, and he was enthusiast enough, fisherman and lover of outdoor life to fully appreciate it, while the rest of us surely could not get our fill breathing in the balmy breezes flavored by ocean's breath.

The Wanderer had known this spot in years gone by, and now freshened his recollection of ranges, points, rocks, etc., to place us on the most favorable fishing grounds, and after

a pleasant row, enlivened with laughter, song and jest, we were soon anchored over one of the best spots, the poles were jointed, the lines strung, and with a "blessing" the hooks were cast to try our chances in getting fish for supper. Soon a reel began to buzz, the line played him, and then the fish made frantic efforts to escape, now breaking in a brilliant flash of light and water, now diving far under the boat; but all to no avail. But soon he was landed and flapping in the creel hung over the gunwale, and "first blood" was scored for the Wanderer.

The Lawyer, the Engineer and the Horse Marine each had their share of luck. The Horse Marine succeeded in getting good and wet as he sat in the stern sheets, and a comber came over and nearly filled the boat. The Lawyer shared a like fate, as the bows caught another as we turned to leave for home; but hunger and "wetness" are both "fisherman's luck," as we all know, and so long as we had the fish we cared little for the concomitants. As we were fishing for fun and for "grub" and not for count, we were easily satisfied with our catch; and to dawdle, loaf, smoke, joke and laugh were as fully enjoyable for us as to land the greatest fish or the greatest number. So in the early twilight we hauled up the anchor and pulled away for home, leisurely rowing, too full of enjoyment to hurry or exert ourselves. At home it was a labor of love to cook our own supper. One went for milk, another for water, a third built the fire while the Wanderer cleaned the fish. Each had a finger in the pie; and from experience gained by other camp fires, we soon had a smoking hot supper, and too many cooks did not spoil the broth. And then, perhaps, the fisherman's hunger was not a sauce piquant! Fish, potatoes, pork, bread, coffee and the rest, disappeared as if by magic, leaving the office of bottle washer—to which the Lawyer had been elected by acclamation—a sinecure. Jack Sprat and his illustrious wife could not have outdone us in our efforts. There was nothing left to swear by. Supper over and our shanty righted up, what more enjoyable than to lounge in the mooulight, gently fanned by the cool evening breeze. Not a trouble, not a care, not even a "skeeter" was there to disturb our peace and enjoyment. From afar over the water came the sounds of music from passing pleasure parties, and from beyond the lights of Fall River glowed and twinkled.

To salute passing steamers is one of "the things" of summer seaside life. So we brought out our cannon, a relic of the early days of the Wanderer's efforts in the mechanical line. It was loaded and made ready to salute the steamer as she passed; and now as we see her light, with a flash and roar we send her our greeting; but the contrary wind prevents her hearing, and we fail to get the usual answering greeting of three short blasts of her whistle. Later the seductive game of "Blue Peter" claimed our attention, the Engineer showing his skill in getting the blue bean the most frequently; but cards are a sorry amusement for tired and sleepy fishermen, so we are soon fast asleep, after mature and serious consideration of how, where and with whom each one was to woo the drowsy god.

The Horse Marine confesses to being a lover of music, and agrees that the "Sweet Bye and Bye" or "In the Morning" may be very lovely under favorable circumstances; he also confesses to a love for sleep in the early morning, even though the early reveille has summoned him to life and action day after day in camp or on the march. But to have reveille sounded on a tin pan, accompanied by the dulcet strains of the Wanderer, whose voice is like a buzz saw in a knotty stick, and that too after he had, as he thought, been asleep for only five minutes, was too much. But such was the morning's greeting at the "Narrows." The sun was shining brightly, the breeze blowing softly, the waves dancing merrily, but all was made hideous by the infernal din that awoke us to a new day, and frightened every bird within a mile into an awed silence. To chuck a boot at the Wanderer was the first motion, to lazily yawn, stretch and finally dress the next.

But the Lawyer, too, appears to be in trouble, and muttered thunder from his direction tells of grief and rage. He had left his clothes out over night to dry after his wetting, and is wondering "why the devil they are wetter now than when he hung 'em up, you know." Had he seen the Engineer take them and dip them in the bay while yet the Lawyer was asleep he would not have looked so anxiously for sign of rain, nor wondered at the heavy dew. And again had he examined his boots before putting them on he would not have run his toes into the jaws of a crab, dropped there over night by the Horse Marine.

But "every cloud has its silver lining," and the early birds are soon forgiven for their unseemly hours and levity, all wrath being soothed by the smoking hot breakfast that now awaits us all. Our plans for the day are soon made, but while waiting for the tide to serve, other amusements than fishing claim our attention.

The Engineer is also a maniac on the subject of photography, and among our plunder are his camera and outfit. So he gets ready for action while we rig lines and hooks and prepare bait for the day's campaign. And now we pose, a lovely group on the porch of our shanty. It is a wonder the glass was not cracked, we are such an array of beauty, but as he shoots us off instantaneously, perhaps there was not time for the plate to get full benefit, and so it escaped annihilation.* Other groups follow, and in one the Lawyer comes up with clam hoe in hand and the look of a fiend in his eye, ready to utterly demolish the Horse Marine, who all unconscious leans on an oar, supported by the Wanderer. Pleasant mementoes these pictures will make, however, so we all gracefully submit to be "took." A target-pistol was also with our plunder, and the Horse Marine having a "craze on the shoot," that weapon of offense on the bullseye is brought out, and we try our skill at hitting clam shells, weeds, bottles, etc. The Horse Marine succeeded in driving the tack at about ten feet, and managed to hit the side of a barn occasionally, but our ammunition giving out and the tide serving right, we were now off again with a white ash breeze for our fishing ground.

Good luck awaits us, and whizzing reels, twanging lines and flapping fish, with now and then a dash of spray over all of us by way of variety, make the hours pass quickly, till the Wanderer and the Horse Marine have had enough and are put on shore with clam basket and hoe to dig for clams as the tide goes out, for four hungry fishermen must be filled, and we are going to have clam chowder for dinner. The basket filled, the two saunter along the beach, leaving the clams for the boat to bring home while the Wanderer and Horse Marine idly saunter toward home. On the way they encounter several pleasant parties, and at last the Ancient Mariner himself, or his first cousin but once removed, who lives in a hut by the beach and must be over eighty years old. But tough and hearty is he yet, and regales the listener with many a weird yarn of times gone by. And so the day goes by, one long delight of sunshine, breeze, and salt sea air enough to take the taste and flavor of alkali and sage from the Horse Marine; the sun sinks in a blaze of glory, the pleasure yachts are seen returning to their harbors, and the four boys are home once more, fish creel full and anchored out, while dinner is discussed and the events of the day talked over.

Day follows day with but a repetition of delight. No care nor sorrow burdens any one, and pleasure and healthful life are the blessings of all. But time goes on apace, and all too soon it is time for us once more to don the garb of civilization and return to our several vocations.

Our horse has enjoyed his rest as well as we, and stamps impatient to be gone as he is put in harness, and soon we are once more bowling homeward, taking with us renewed vigor for our daily life, as well as pleasant memories of our trip. As we rise over the hill the bay flashes to us a parting glance from sparkling wave, as lovely as was its welcome, as lovely as would be its welcome in time to come, when again we may greet it for another outing.

ONE OF THE BOYS.

* This "chestnut" about the cracked camera was originally plucked by Daguerre in his youthful days.

CONNECTICUT RIVER SALMON IN 1730.—The best fishing grounds in the river in early days were probably at the falls between Suffield and Enfield. The following record, clipped from proof sheets of Suffield's "Documentary History," seems to disprove the tradition of the superabundance of salmon in the Connecticut River at least 150 years ago, the price of salmon per pound being twenty times that of shad, estimating the latter at four pounds' weight each: "At a legal meeting of ye freeholders and other inhabitants of Suffield on December ye 4th, 1730. 1st. Capt. John Kent was chosen Moderatour of sd meeting. 2dly. Voted, that the petitioners ye owners of ye fish Dam have ye priveledge they petition for that is to say the Town are willing for it provided ye sd owners sell salmon at five pence pr pound, and shad at a penny apiece, and that they will not barrill up any for a market when any of ye Town appear with any vendable pay to take them off for their own use, and that the owners put one Hundred pounds security into the Town Treasurer's hands for the Town's security for the fulfillment of the above sd, when they sd owners have a grant of the General Court, and ye security to be given to ye Treasurer before nine o'clock to-night. Test, JOHN KENT. Jacob Hathaway, Samll. Copley, Richard Woolworth, William Halladay, Nathaniel Hall, non-voter, Samuel Roe, Samll. Hathaway, Peter Roe, John Roe. Entred their Decents against ye above written Vote, December ye 14th, 1730. Then Received of Eight of ye owners of ye fish Dam a bond of one Hundred pounds according to ye above sd vote. pr me Joseph King Town Treasurer."—*Hartford Courant.*

HOW TO CATCH CRAYFISH.—Take thirty to fifty osier twigs, or split white ash sticks, according to the size used, and three feet in length, form a bundle of the whole and bind at each end with strong cord or wire, separate the twigs or splints in the center of the bundle by means of sticks, ten, fifteen and twenty inches long, and forked at each end, so when in place the trap will be spindle-like in shape, with the twigs evenly distributed about its circumference and center, and far enough apart to allow easy entrance for the fish, but from which they will not readily escape. Bait the inside with fresh meat of any kind, only see that it is fresh and bloody, if possible; set the same with the current in running water; if blood can be procured, pour a pint or so on the bait, it will taint the stream for a long distance. I have watched crayfish in great numbers follow up the track or scent thus made from thirty rods below the trap, and have known six and eight quarts taken at a single lift. Should one desire a more substantial and comely rig, it can be made by driving a smooth, stout stick lengthwise through the center of the bundle, slide the tied ends down on the stick until the whole bulges to a diameter of twenty inches or more in the center, fasten the tied ends of the twigs to the center stick, put three hoops of proper size over the whole and fasten with fine copper wire. In order to make hiding places for the crayfish and so retain them in the trap, numbers of the twigs should also traverse it in various directions.—DR. E. STERLING (Cleveland, O.).

THE PARADISE FISH.—Mr. Hugo Mulertt, of Cincinnati, writes of this fish to the editor of the *Scientific American* as follows: "In your paper of July 11, you print an article on the paradise fish. The writer, in praising this really beautiful and interesting little fish, goes even so far as to 'hope that they may be introduced into American waters.' Five years ago I imported six pair of two varieties of paradise fish (*Macropodus venustus* and *M. viridi auratus*). I have since that time raised many thousands of young ones from these, and am perfectly acquainted with their habits of nest building, their still more interesting way of rearing their young, their fighting qualities, and also their diseases. I therefore hope that the Lord may prevent another experiment, which no doubt would prove as fatal to this country as that made with the English sparrow. The paradise fish are as fully, if not more, destructive to fish eggs, young fish, and fish food, than our native sticklebacks, darters, and the small varieties of sunfishes; they destroy without any other compensation than their beautiful colors and interesting habits, which, however, are only observable when the fish is kept in a glass vessel. Those interested in this subject I respectfully refer to an illustrated article on the paradise fish, printed Aug. 11, 1881, in FOREST AND STREAM."

COLORADO TROUT.—Topeka, Kan.—Allow me to thank "Kokomo" for his information in regard to Colorado trout streams, and best flies and sizes of hooks. Although I am not quite a novice at fly-fishing, still I am one as concerns Colorado waters. The streams "Kokomo" mentions, with the addition of Poncha Creek, were fished by myself some nine years ago, but without flies. The leading habit of the trout was to take all he could get, from a bare hook to a small elephant. One half-pound fellow took my grasshopper three different times, and lost it each time before I could land him. At his fourth rush I hooked him hard and elevated him with vigor, and last seen of him he was taking an aërial voyage across the mountains toward Saguache.—H. B.

LITTLE ROCK, Ark., Aug. 4.—Fishing is spoiled by the exceedingly hot weather. The fishing law is constantly violated and nets are in every stream and lake. It is such an abortion nobody could be convicted under it. He could always slip out of some loophole made by the exceptions.—CASUAL.

ST. LAWRENCE RIVER ASSOCIATION.—Clayton, N. Y., August 5, 1885.—The annual meeting of the St. Lawrence River Anglers' Association was held at Clayton to-night, and the following officers were elected for the coming year: President—John Flanagan, of Utica. Vice-President—Charles G. Emery, New York. Second Vice-President—G. M. Skinner, Clayton. Secretary—W. W. Byington, Albany. Treasurer—W. W. Storry, Albany. Executive Committee—J. H. Quimby, Albany; M. P. Bush, Buffalo; H. P. Warren, Rochester; Theodore Butterfield, Utica; J. H. Brownlow, Ogdensburg; C. H. Ballou, Utica; H. S. Chandler, W. C. Harris, A. R. Norton and A. D. Williams, New York; H. E. Morse, Clayton; W. G. Deshler, Columbus, Ohio; W. H. Thomson, Alexandria Bay; F. E. Comstock, Rome; E. H. Britton, Kingston, Ont.; James T. Storry, Albany; James Eaton and C. Greenman, Utica. F. M. Danaher, of Albany, was elected advisory counsel of the association. The treasurer reported $1,100 on hand, which it was decided should be used in protecting the river from illegal fishing. The chairman of the executive committee reported eighty-seven nets captured and destroyed by the river game protectors during the year. As a consequence there is very little illegal fishing being done this season, and bass fishing is now better than it has been before in five years. The Anglers hold their annual picnic next Tuesday.

TROUT IN THE SANCHO POGHO.—San Luis Obispo, Cal., July 27.—*Editor Forest and Stream:* The FOREST AND STREAM is more welcome to me now than at any time in the past, as I am compelled to keep close to business and can only follow the chase or cast for trout in recalling the past. Mr. Lawton, C. W. Dana and several others had an outing for a week from this place and captured over two thousand trout seventy miles from here, at a creek called Sancho Pogho. All their friends had a feast on their return. Of course that fired the other fishermen and another party was organized, with Dr. French as leader and John Gaxiola as high fly manipulator extraordinary, and on their return a big catch was again recorded and all friends again were feasted. The quail are very numerous, and are an injury to the crops in and about twelve miles of this city. Doves are very abundant and I have had plenty presented to me by shooters. Some years ago carp were placed in a body of water at Morro Bay, eight miles from here; they are very large now, and before long I intend using a spoon on them. I can well remember the time when I was laughed at for casting for bass with a fly in Minnesota, and again on the Columbia River trolling with a spoon for salmon. But it is an old story now. I am confident that, with all things favorable, I can capture carp with a spoon.—W. P. C.

THE MOUNTAIN HOME CLUB.—At a meeting held in New York on Friday last this club was organized. The following officers were elected: President, Hon. Warner Miller; Vice-Presidents, Hon. William M. Evarts and Charles A. Dana; Secretary, Fred Mather; Treasurer, Clarence M. Roof. The Board of Directors for the first year will consist of the above named officers and Gen. R. U. Sherman, of the N. Y. Fish Commission. The club will purchase all the real estate and personal property of Hon. O. B. Matteson in Herkimer county, N. Y., including Wilmurt and part of Big Rock lakes, the large club house, the furniture, horses, carriages, boats, icehouses and lodge, and about 3,500 acres of timber land. It will also buy the "Ballou tract" of about 3,400 acres, including part of Pine Lake and several miles of the east branch of West Canada Creek, and will control by lease the whole of township No. 10, including about 15,000 acres and some dozen more lakes. At the start the membership will be limited to twenty with privilege of increasing to thirty. The region is well stocked with fish and game and is very easy to protect, as access to the territory is only possible through Wilmurt Lake. Several gentlemen have applied for membership and it is expected that the club will soon fill. The membership fee is $2,500, and assessments are limited to $100 per year.

THE CANADA SUNDAY FISHING CASE.—Montreal, Aug. 8.—Sir Roderick Cameron has not submitted tamely to the fine imposed upon him by one of the inspectors of the Marine and Fishery Department for "killing salmon on Sunday," and has presumably by the advice of his fellow-transgressor, Judge Henry, appealed from the fine of $10. The grounds of the appeal are that the prohibitory provision is merely an economic one, covering the Sabbath day for the convenience and protection of the fishermen who are employed working the nets on the lower St. Lawrence, and has no reference whatever to Sabbath observance, and that it is founded in the public interest, as it slackens the severe strain of continuous netting. An ex-Minister of Fisheries has written a letter to the press on the question in which he says: "Sir Roderick Cameron's defense in appeal should not only acquit him of the fine and reproof, and exonerate the narrowly escaping Judge, but it should also occasion the immediate repeal of the obnoxious and unlawful regulation. Even if it was legal, the power of a fishery guardian or warden does not extend to inflicting fines for its enforcement."—*Evening Post.*

MINNESOTA BASS.—Hastings, Iowa, Aug. 5.—Will Mr. H. P. Ufford kindly give the dimensions of the Bethabara rod he mentioned in last week's issue, length of second joint and tip and size at ferrules and oblige. I spent three weeks of June bass fishing in Minnesota at Lake Madison and adjoining lakes in Blue Earth county. Had good success with frogs, also took some with fly-rod. The grizzly king seemed to be their favorite as they were feeding on dragon flies.—HOLLOW RIB.

THE SHAD.

IN the report of the Pennsylvania Fish Commission for 1883-'84 we find the following paper on the shad, by D. W. Seiler, Esq., of Harrisburg, secretary of the State Agricultural Society:

"This, of all other fish is one, the supply of which for years has not equalled the demand. How to increase the catch and supply cheap food is a question of the greatest importance to the people, and one that the Commission is doubtless most anxious to accomplish.

"To discuss this question properly it is necessary to go back to the times when there were no obstructions in our rivers, and when the farmers and others for a distance of fifty miles

each side made their yearly pilgrimages to the streams in April and May to secure their fish food for the ensuing summer, where they could purchase the run or catch at an average of $12 per hundred, or at the rate of about three cents a pound. In those early days they would flock to the riverside waiting for the drawing of the seine, and on the banks of the stream clean and salt down one, two or three barrels, as might be required for the summer supply for their families.

"That is what is aimed at now, but to accomplish it there must be taken into consideration the increased demand on account of increased population; must consider the numerous obstructions placed in the streams in the shape of dams, fish-baskets and other contrivances; must examine the conditions of the water at that early day, compare them with those of this date, and see if it is not possible to accomplish the desired object.

"There were then, comparatively speaking, but few inhabitants along the rivers, and for that reason the demands for shad were limited. Now, being thickly settled, the demand would of course be very much greater. Can an increase in numbers be guaranteed? If so, how can it be attained? We must look at the obstructions, if any, and to the march of the fish from the sea, and ascertain what trouble confronted those in their migrations from the salt water to the headwaters of the rivers, where they deposited their spawn.

"It can easily be demonstrated that there was no general increase of shad when they spawned and their eggs were hatched in the general way. Granting that each female shad deposited her 100,000 eggs, it does seem strange that out of that great number a large return was not made each year. Some years the catch was greater than others; but that could be accounted for by the favorable condition of the water at the time of the deposition of the eggs by the female, while at others muddy, swollen waters prevented the eggs from maturing. This, with the enemies which preyed on the deposit, regulated the numbers to be returned.

"When it is said that if the two parent fish—the female with her 100,000 eggs—will not produce more than their original number to be returned from salt water, it seems preposterous; but for a moment consider this fact: Suppose that a pair of fish should produce and return to the stream of their birth three fishes instead of the original number, two, the increase would be 50 per cent. Starting with 1,000,000, in ten years the number, increasing in the above ratio, would reach 37,000,000. Now, by a wise provision of nature, this increase was prevented, as the waters of the streams would not maintain such an increment. In order to bring about a return of those prosperous fish days, what, then, is needful to be done? How are the desired results to be accomplished, or, if we cannot restore the former bountiful fertility of the rivers, what must be done to secure a reasonable approximation to it?

"First—Obstructions must be removed and fishways built, so that the passage of the shad from the sea to the spawning grounds will not be interrupted or interfered with. Can this be done? Can a successful fishway be erected—one that will fully carry out this idea? If it can, the Legislature should not hesitate one moment to appropriate sufficient funds for the purpose.

"Second—Concurrent legislation with Maryland to secure for Pennsylvania a chance to harvest the crop she sows—making a close time from sunrise on Saturday morning of each week until sunrise of the following Monday—prohibiting fishing for shad with any device that will in any way prevent the fish from passing up to our State line.

"Third—To plant in the headwaters of our principal rivers, young shad by the million; they to be permitted to migrate to the sea without having their passage interfered with by fish-baskets or other destructive devices.

"Artificial propagation is no longer a matter of experiment. It is an assured success. Full ninety per cent. of the eggs taken from the female shad can be hatched, and the young fry placed in the water in less than four days. Now this 100,000 of eggs will produce 90,000 young fish, and out of that vast finny army, a very large number may reasonably be expected to return to the spawning grounds. By artificial propagation, a supply equal to the demand can be furnished, and thus, as has been shown, more than make up for the increase of population and enlarged consumption.

"The results cannot fail to be of great benefit to our people, and to the general prosperity. With such rivers as the Delaware and Susquehanna, whose tributaries permeate every part of the State east of the Alleghenies, this supply of cheap and wholesome fish food can be brought to the door of every house.

"Taking another view of it, let us now for a moment consider the dollar-and-cent advantage to be derived from a restoration of the original shad fertility of our rivers. Take, as an illustration, the city of Harrisburg, with its 30,000 inhabitants, representing say 5,000 families. Suppose beef to be fifteen cents a pound, a plentiful abundance of fish food at the doors would compel a reduction in the price of beef, and the consumption of beef being estimated at only one pound per day for each family, there would be a saving of $50 per day, or about $18,000 a year. But suppose that instead of beef, the 5,000 families would use fish for one-half of the year, at a cost of five cents a pound, the saving would be $90,000 annually to that city. This economy would apply not only to the city of Harrisburg, but to the population living within a distance of thirty miles on each side of the Delaware and Susquehanna rivers. A careful estimate of the total saving would, there is every reason to believe, amount to $1,000,000 annually. Instead of importing cattle from the West, and sending vast sums of money out of the State to pay for them, fish food should be furnished for the people, and that money be retained for other purposes.

"The abandonment of the canals is, in my opinion, only a question of a few years. With their disuse will follow the removal of the other principal obstructions in the Susquehanna.

"I suggest that in lieu of the present fishway at Columbia some other be adopted that will be certain to bring about satisfactory results. It is, in my opinion, a matter of vital importance to adopt such measures as will serve to re-establish the fish productions of our principal streams, at least as far as shad are concerned. They are, undoubtedly, the most valuable indigenous fish we have. To permit them to become extinct would be almost criminal, but that such will be the result, unless remedial measures are speedily adopted, is as inevitable as that night will follow day."

THE OYSTER BEDS OF NEW YORK.

[Read before the American Fisheries Society.]

BY EUGENE G. BLACKFORD.

DURING the past year an investigation has been in progress in the State of New York, under my charge, for the purpose of ascertaining the actual condition of the oyster areas of the State, and to gain some general knowledge of the oyster industry as carried on in our waters.

This work was begun on the supposition that there was danger of a failure in our oyster supplies in the near future, unless some steps were taken toward remedying certain practices and evils which were thought to be detrimental to the success and continuance of the industry. Thus far only a portion of the oyster territory of the State has been examined, and that only superficially, yet the examination has been sufficient to establish two points, one of which shows conclusively the need of such an investigation and the other that there is no danger of a failure in the supply of these mollusks for our markets. These two points are, first, that the natural oyster areas of the State are in bad condition and very much less in extent than they were a score or more of years ago, and second, that the loss in the natural areas has been much more than made up in the formation of planted beds, some of which occupy the localities of natural areas which have been exhausted of their natural supplies, and have been repopulated by artificial means, and some of which have been formed on territory that never was natural oyster ground, and by reason of this increase in the amount of territory upon which oysters are grown a great many more oysters are now sent into market each year than were thus shipped some few years ago. This is true to a very large extent of all the oyster regions of our State, the natural areas have been worked until, in many instances, they have been entirely depleted, and in all cases very much lessened in productiveness; and then the planters have appropriated the exhausted lands for planting purposes, and extended the planted areas outside of the old bed limits, but some of the oyster regions show much greater changes in this direction than the others. This is perhaps more noted in the neighborhoods of Staten Island and City Island than elsewhere, since these regions are not only close to our great metropolitan markets and therefore can be drawn upon at short notice, but they have suffered more than the others from the direct action of the refuse materials thrown into the waters from the cities of New York, Brooklyn, Jersey City and their suburbs. This has been a source of great injury, and where formerly many oysters were obtained from along the shores of the Lower Bay, around the northern end of Staten Island and along the East River, now there are none to be got, or if any can be secured they are so contaminated with the acids and filth of the waters that they are of no value as food. This is an evil which can only be remedied by careful and consistent legislation regarding the sewerage of the great cities and the disposal of waste matters.

In the neighborhood of City Island there were formerly many large tracts of natural oyster beds, from whence great quantities of fine oysters were obtained; but as there were no stringent regulations in regard to the working of the beds or the protection of the oysters during the breeding season, and no system of guarding the beds, they were gradually despoiled and their places taken by the planted areas; and the same may be said as regards the lower portions of Staten Island, and in fact, of all portions of our State. To a certain extent, this is an advantage to the oyster industry of the State, and to a certain extent it is a disadvantage. By having these lands brought under the direct influence of individual oystermen, that is, by transforming them from public into private property, they can be better protected than when open to every one, as each individual planter will feel more of an interest in guarding his own land than in guarding the land of the public domain, and they can accordingly be worked in a manner to promote the welfare and continuance of the bed, rather than in such a manner as to exhaust it as quickly as possible.

It is on the principle, of course, that business, in order to be successful, must be personal to those engaged in it, and while this may be largely true as regards the oyster property of the State, yet if the beds are permitted to become exhausted in this manner and then to be taken up as they have been in the past, by any one who desires to appropriate this kind of property, it will cut off a great number of people from obtaining seed oysters, and furnish private property to a greater or less number of individuals, without any recompense being given even to the State or to those deprived of the privilege of gathering oysters from public beds. It would seem as if it would be better to guard the public beds, and preserve them as seed grounds, and encourage the planters to appropriate land for artificial cultivation that is not suitable for natural growth, enacting suitable laws for the protection and guarding of the natural areas, and for the perpetuity and protection of the planting industry. Many of the oystermen feel at the present time that there is no certainty, from the present condition of the laws, that they will ever gain anything from any improvements they may make, or for any expense that they may be to in fitting up territory which is not now natural bottom, but which might be rendered excellent for plants; and so they do not enter into the work as heartily as they otherwise might do. And in view of the chaotic state of the laws in general, and the peculiar way in which many of them are carried out, it is somewhat to be wondered at that so much has been accomplished in the direction of artificial culture as has been done. The possibilities in this direction are well illustrated in Jamaica and Hempstead bays upon the south shore of Long Island. In the towns bordering upon these bays laws have been enacted, under authority from the State, whereby any resident can appropriate three acres or less of land under water, for the purpose of oyster cultivation, and the occupant is protected in his rights and titles to such land so long as he works the land and pays the rent upon it. The land under water thus becomes practically the same as the land above water, a permanent property of the planter, and is worked just as upland is, to preserve it and yet get as much out of it as possible. The consequence is that where a few years ago only a few oysters were raised for market, to-day the industry represents hundreds of thousands of dollars annually, and can be yet greatly increased by the employment of new methods of getting seed and caring for the growing stock. As it is it represents the most active and progressive oyster center in our waters.

One great difference between this and other oyster regions is, that here they recognize the value of a thorough working of a small amount of territory, while in other localities the oystermen generally try to get and hold all the territory they can, without any particular regard to how well such territory is worked. Some of the other regions are following to a certain extent in the footsteps of the planters of Jamaica and Hempstead bays, and just in this proportion are they meeting with success. While the industry in the State is, as a whole, in fair condition, so far as regards the number of oysters sent to market, the number being, perhaps, three or four times what it was fifteen years or so ago, it is not what it ought to be or may become, and the future supplies will depend largely upon the care with which the oystermen guard the present seed beds and work their planted territory. The possibilities are great, provided advantage is taken of all improved methods of culture and some desire is shown to perpetuate rather than destroy the natural areas.

It is to be hoped that the oystermen will cordially co-operate in the work now in progress, and that by means of judicious legislation the natural beds may be preserved and protected and the industry stimulated and permanency given to it in our waters.

FULTON MARKET, New York.

THE FISHWAYS ON THE OSWEGO.—This spring, when the distribution of salmon fry was made by the U. S. Fish Commission from Cold Spring Harbor, N. Y., some were placed in the Oswego River, and the Superintendent of the hatchery was requested to have the messenger who took up the fish, make an examination of the condition of the fishways. He did so, and we are permitted to publish his report, from which it would seem that it should be the business of some one to attend to their working. It seems that fish go up when there is water enough to permit them, but that the flow has been stopped. We give the report in full: "FRED MATHER, Esq., Superintendent of Hatchery. Sir: As desired by you, I personally inspected the four fishways in the Oswego River between Fulton and Oswego, and found that they all need more or less attention. They are very dirty, the pockets being full of dirt and drift, while at the head of each there has collected a ton or more of sticks of all sizes and shapes, which, with the grass and roots that have been forced among them by the strong current, makes a network that would be very difficult for any fish to pass, let their journey be up or down. The one near Oswego is of no use in its present condition: it has a bulkhead built across the top that entirely shuts off the water. This was built by the men on the State boat, which repairs the canal. In regard to working of fishways I could learn but little. No one appeared to take any interest in them. At Mentto a Mr. Doe caught on May 3, 1885, a 'white mullet' [*Moxostoma?*], the first ever taken at that place. The fish would have to pass three fishways to get there. A. H. Leonard, of Gaurdlock, says that he has seen lake shad, pickerel and rockbass go both up and down the fishway at that place; saw in spring of 1884, thirty or forty lake shad go up in one day, and on May 15, 1885, saw three try to get up, but lack of water prevented. The fishway at Mentto has too great a flow I think to be successful. The water rushes down it with terrible force, flowing over the side a tremendous stream, in fact there is little difference between fishway and dam. In conclusion I would say, judging from present condition of the fishways, that it is necessary that some one should be sent at least twice a year to look after and clean the same. If this is not done I have doubts of their success.—F. A. WALTERS."

FIXTURES.

BENCH SHOWS.

Sept. 22, 23, 24 and 25.—Dog Show of the Milwaukee Exposition Association. John D. Olcott, Superintendent, Milwaukee, Wis.

Sept. 29, 30 and Oct. 1, 2.—Third Annual Dog Show of the Southern Ohio Fair Association. H. Anderson, Secretary, Dayton, O.

Oct. 5, 6 and 7.—Second Annual Dog Show of the Philadelphia Kennel Club, in conjunction with the Pennsylvania State Agricultural Society. E. Comfort, Secretary, Philadelphia, Pa.

Oct. 6, 7, 8 and 9.—Fourth Annual Dog Show of the Danbury Agricultural Society. S. E. Hawley, Secretary, Danbury, Conn.

Twelfth Dog Show of the Western Pennsylvania Poultry Society, Pittsburgh, Pa. C. B. Elben, Secretary.

FIELD TRIALS.

Nov. 9.—Second Annual Field Trials of the Fisher's Island Club, for members only. Max Wenzel, Secretary, Hoboken, N. J.

Nov. 9.—First Annual Trials of the Western Field Trials Association, at Abilene, Kan. Entries close Oct. 15. A. A. Whipple, Secretary, Kansas City, Mo.

Nov. 16, 1885.—Seventh Annual Field Trials of the Eastern Field Trials Club, High Point, N. C. Entries for Derby close May 1. W. A. Coster, Secretary, Flatbush, L. I.

Dec. 7.—Seventh Annual Field Trials of the National Field Trials Club, Grand Junction, Tenn. Entries for Derby close April 1. B. M. Stephenson, La Grange, Tenn., Secretary.

A. K. R.—SPECIAL NOTICE.

THE AMERICAN KENNEL REGISTER, for the registration of pedigrees, etc. (with prize lists of all shows and trials), is published every month. Entries close on the 1st. Should be in early. Entry blanks sent on receipt of stamped and addressed envelope. Registration fee (50 cents) must accompany each entry. No entries inserted unless paid in advance. Yearly subscription $1.50. Address "American Kennel Register," P. O. Box 2832, New York. Number of entries already printed **2519.**

DO WE WANT A NEW STANDARD?

WHEN the American Kennel Club was formed I understood it was to be composed of clubs only, and that was the reason why well-known individual breeders were excluded from its councils. Article II. of their constitution has, among other things, the following: "To adopt and maintain such measures as shall tend to the mutual benefit and protection of its several members."

I am much obliged for the kind invitation you have given, to express through your valuable paper views in regard to a new setter standard proposed by the A. K. C. I must, however, decline to accept it, as it would be in bad taste to offer any opinion of mine—in favor of or against the action of the A. K. C., as I am not a member, nor have I been asked for my views. As a club they certainly have the right to make their own standard. If, however, you simply wish me to record my name as for or against a change of the setter standard, I most decidedly say, no change.

If we must have a changed standard forced upon us I trust breeders will receive with it a recipe for breeding up to the new standard. Those who know how to make the standard, ought to know how to make the dogs come up to it.

The suggestion of "Justitia"—to confine breeding and shows to a few dogs of selected kennels—would accomplish the object, to be sure, but it would reduce the number of exhibits, and fail to afford the advantages of comparison; and besides, it does not provide any method for disposing of the old favorites. To carry out such a plan it might become necessary for the club to disqualify the exhibitors of specimens of the old standard in order to get the latter off the benches. If one may judge from the treatment lately given Mr. Pierce, we are fast approaching even this possibility. Dogs are sacrificed, why not their owners? Every one knows that up to the present time the standard for setters has not been adhered to by the judges. Personal prejudice and preference has decided the case.

The standard will never be of any use, and will never be adhered to until judges are able to give the "score" of the winners. Then a perfect standard will be a great help to the dog-loving public, and breeders and exhibitors will quickly learn what a perfect dog is, and wherein the standard is at fault, to say nothing about the judges. I have been a regular exhibitor since 1875 (that memorable year when we stood by and saw a fraction of a point added to the score of the favorite after judging had been done, in order to make him win), and I have never yet seen my dogs judged by a standard. They have been taken as a whole and judged at a glance—the judge ignoring points—but fully satisfied with his own "perspective." I have actually stood by and seen a broken-backed animal from my kennel awarded a figure over her kennel companion, possessing a perfect anatomy. But I must not go into particulars, suffice it to say I have seen enough of the "dog-as-a-whole" judging, and can give the particulars if required. What we want most of all now, for the good of the breeders and the exhibitors, and in return for their liberal patronage of shows, is a sticking to the standard. Let us know what our exhibits score; where they are weak and where they are strong.

The "dog-as-a-whole" plan of judging has been a complete failure, so far as any instruction has come from it, for the benefit of exhibitors and the public. It has satisfied the judges and the managers, and has cut off the privilege of protest—but it does not satisfy the public. Let us have one show where the dogs are judged by the old standard and the scores of the winners given, before it is discarded.

What an opportunity for instruction in the study of the dogs's anatomy would be afforded dog lovers if we could have a bench show rigidly judged under the standard by a competent judge, who should be paid liberally for his time and services, and who would give the scores of the first, second and third prize winners, and perhaps the first vhc.

How the owners would compare the anatomy of their own exhibits with the winners, and what information each visitor would take home for future use, in breeding or purchasing! I think the time has come for this.

Of course we all know that the score plan of judging has great difficulties presented in carrying it out, and most experts say it is absurd and even an impossibility. But both these conditions enter into the present plan of judging, under which the exhibitor learns absolutely nothing, except to mind his own affairs and not to ask questions.

I believe one could learn more from such an exhibition than

has been taught us by all the shows we have had put together. Let us have a glimpse of the old standard, and let it have a chance to make a record before it is withdrawn.

S. FLEET SPEIR.

BROOKLYN, Aug. 10.

Editor Forest and Stream:

In response to your invitation to give views on the English setter standard I would say that in the absence of any definite information as to the changes contemplated by the A. K. C. committee there seems to be nothing to say on that subject.

I can only express the hope that when the discussion does open those who take part will confine their remarks to the forms and qualities of dogs, and omit the usual disquisitions on the motives of the various persons interested. Nothing whatever can be proven as to anybody's motives, whether good or ill, since they are known only to himself. All argument on the subject is worse than useless, as it generates ill feeling without accomplishing any desirable end. As to the acts of persons the case is entirely different, for there we have something definite and demonstrable. If the committee propose changes of the standard that are not good, we can easily show why and wherefore and defeat them. Any standard should have in view:

First—To indicate the form that is best adapted to the work the animal has to perform. Second—To indicate certain peculiarities that are not useful in work, but are the usual accompaniment and sign of race purity, and are valuable, as they afford an outward sign of the presence of the mental qualities of the breed and of the ability to transmit forms and qualities to offspring. Third—To establish the highest type of beauty consistent with the aforementioned practical qualities.

The Stonehenge standard has been especially valuable on account of the stress it lays on those points that indicate pure breeding. There is often a gain in form to be made by outcrossing, but this is generally more than offset by impairment of useful mental traits. Witness the deplorable effect of the hound cross in rendering pointers stubborn and jealous; or a gain in disposition is apt to entail a loss in form. Hence a standard should so strongly handicap all mongrelization, that breeders will only outcross when no other means will suffice.

Experience shows us that there are two kinds of good dogs. First, those whose form is so good mechanically that they perform their work with a minimum expenditure of force. Second, those who possess an extraordinary amount of vigor and vitality, and are therefore able to generate and expend the amount of force needed to propel a less perfect mechanism.

Rarely, indeed, are both these qualities found in one individual. The dogs indicated in the first class are most easily recognizable in the show ring, and thus have a great advantage. If the standard were to be made to describe these too narrowly, the additional handicap would deprive the second class of all chance of winning in shows, and we should be in danger of losing several valuable strains, whose blood is needful to impart vigor and stamina to our dogs.

There seems to be a great deal of misapprehension as to the form prescribed by "Stonehenge," and still more carelessness, not to say ignorance. The fresh way in which people who don't know the standard give their opinions *pro* and *con* is altogether surprising. Take our field trial winners, and on the whole they conform very closely to the "Stonehenge" standard Their body, limbs, feet and skulls are almost perfectly in accordance with it. Their noses are frequently an eighth, or in extreme cases a quarter of an inch short, but otherwise good. In ears, eyes, lips, coat and stern they are often defective. Thus they are near to the standard on all the large counts and fail only in the small ones. So when a judge comes to score them they have to win. I would not be understood as wishing to defend any particular decison, for there are field trial winners whose form ought never to receive sanction on the bench. My statement is a general one.

I have some Gladstone stock in my kennel, and have, after studying the animals, book in hand, concluded that the "Stonehenge" standard is very favorable to that strain. I do not see that any additional advantage is needed on its behalf.

JOHN M. TRACY.

Editor Forest and Stream:

"Justitia's" letter in FOREST AND STREAM of Aug. 6, relative to new setter standard, has my unqualified indorsement. I believe, as suggested by "Justitia," that the only way to decide as to whether the standard for English setters shall be changed or not, is to have all those interested in that breed to vote for or against a change. By that means we will get the opinions of the mass. If none have yet sent in their names as in favor of or opposed to a new standard, please head the list of those who are opposed to any change in the present standard, which I think cannot be improved upon, with the name of your humble servant, F. WINDHOLZ.

NEW YORK.

Editor Forest and Stream:

As you express a wish for the views of your readers on the new setter standard in your issue of Aug. 6, being one of your readers I am decidedly in favor of the maintenance of Stonehenge's standard as it now exists without any change or variation whatever. If an old and established standard can be set aside at any time for the convenience of those owning a different type of dog by the parties interested in that particular type, it can only result in confusion and general dissatisfaction. With as much experience as the owner and breeder of setters, as probably many men of equal age in the country, and a field experience with them greater than any person with whom I am acquainted, I have never succeeded in owning one thoroughly perfect according to Stonehenge's standard, and until I can do so have no desire for a change. JOHN DAVIDSON.

MONROE, Mich., Aug. 10.

Editor Forest and Stream:

In regard to "Justitia's" article on English setter standard, I do not share his fears. Messrs. Taylor, Higgins and Bryson are entirely competent to frame rules to judge the English setter by. I know no one more so, and there is little fear that they will make any mistake. I doubt if they will change the old rules very much. At any rate, if they are framed after the Paul Gladstone type they will do for me. LUTHER ADAMS.

BOSTON, Mass., Aug. 10.

THE LAVERACK MONUMENT.

Editor Forest and Stream:

In answer to different inquiries in regard to the Laverack monument fund, you will oblige me by publishing the following letter:

DANBY LODGE, Grosmont, R. S. O., Yorkshire, England, 2d October, 1883.—Mr. Erdman A. Herzberg, Brooklyn, Kings Co., N. Y., U. S. A.—Sir: I beg most respectfully to thank you for your cheque for 15 guineas, to be expended by me, with other subscriptions received, in the erection of a tombstone over the late Mr. Laverack's grave. I may first say that I am going to the south of Scotland in the course of a fortnight or two weeks to select the stone. Thanking you much for the part you have taken in the Laverack monument fund, believe me to be, sir, your most obedient and obliged servant, EDWARD ARMSTRONG.

Received from Erdman A. Herzberg, Esq., of Brooklyn, U. S. A., the sum of fifteen guineas toward the erection of a tombstone over the grave of the late Laverack. (15 guineas). Edward Armstrong, Danby Lodge, Grosmont, R. S. O., Yorkshire, England, 2d October, 1883.

These are all the funds collected by me, and the names of the subscribers were duly published in the different sporting papers two years ago. E. A. HERZBERG.

BROOKLYN, Aug. 12, 1885.

THE IRISH WOLFHOUND.

Editor Forest and Stream:

Mr. Andrew Byrnes, of Philadelphia, during a conversation with the writer relative to the article in last week's FOREST AND STREAM on the Irish wolfhound, stated that before he came to this country, twenty-five years ago, he had seen not a few of the dogs in question, which although might not have been the purely bred ones, were certainly half or three-quarters of the blood, and that many of the deerhounds in his section of Ireland showed unmistakable evidence of the cross. He also states that he could no doubt at this date find animals which strained back to the Irish wolfhound and that "looked it all over," being perfectly familiar with the breed, judging from some very old paintings he had seen of the dog. He has taken so much interest in this breed that on one occasion he followed Mr. Lester Wallack, the actor in New York—who had one of these dogs, said to be the last of his race, at his heels—for several squares for the purpose of inspecting the animal.

The writer now remembers having heard a few years since that Mr. Wallack owned an Irish wolfhound, but never saw it. It would be very interesting to your readers, both here and in England, if Mr. Wallack would give a short history of his dog, and state where he procured him, as perhaps some of the same blood might still be obtainable and be of great benefit to the Irish Wolfhound Club just organized in Great Britain.

Mr. Byrnes gives as his opinion that Mr. Wallack's dog was either purely bred or nearly so, and he understands thoroughly the points of difference between the deerhound and the Irish wolfhound. Will not Mr. Wallack or his son kindly give the history of their dog? HOMO.

PHILADELPHIA.

GRAPHIC IN THE STUD FREE.—*Editor Forest and Stream:* In order that I may do my share toward improving the breed of pointers in this country, I hereby offer through your paper the stud services of champion Graphic *free* to not more than ten bitches on the following conditions: First—Said bitches must be of known pedigrees and field qualities, healthy, and not over six years old. Second—The owners must agree with me in writing to enter and run at least one brace from each litter in next year's Derby or the following year's All-Aged stakes if too young for the Derby. Third—The owners must also agree to exhibit at least one brace from each litter at either the New York, Boston, Philadelphia, Chicago, St. Louis or Cincinnati bench shows for 1886 and 1887, at their option. Fourth—Default in any of the above conditions (unless by reason of the death of the whelps) shall render the owner liable to pay me as liquidated damages the sum of $100 for each bitch so served. Fifth—Each owner must make a public record of each litter when whelped, with carefully detailed statement of color, markings, sex, etc., and must register the same in the *American Kennel Register*. Sixth—All applications must be accompanied by a written statement showing age, color, markings, weight, pedigree, record (whether on the bench or in the field), probable date of visit, and such full information as will enable me to arrive at a just estimate as to the merits of the several bitches. My object being solely to improve the breed of pointers, I shall reserve to myself the right to reject any or all applications if they do not come up to the standard of excellence I may determine is necessary.—JAS. L. ANTHONY (No. 44 New street, New York).

THE PHILADELPHIA FALL DOG SHOW.—In a very few days a premium list of this coming show will be ready for distribution. Some of the judges have already been selected, and a complete list will be sent your paper when it is filled. Breeders who intend going West to work their dogs prior to the November field trials, can readily take in the October show of the Philadelphia Kennel Club on their way out. Last year there was an average daily attendance of 30,000 people at the Fair Grounds. It is expected that this number will be doubled this year. The arrangements entered into with the Pennsylvania State Agricultural Society preclude any chance of a jam or crowd before the dogs. There will be as much room given as is needed, and 1,000 animals can be readily kenneled with ample room.—HOMO.

MILL BROOK KENNEL.—Mr. W. W. Tucker informs us that he has sold his interest in the Mill Brook Kennel, to Messrs. R. M. Hasbrouck, Jr. and Wm. Montgomery, Jr. Mr. Tucker is expecting several fine St. Bernards from Switzerland soon, which will probably be added to the Mill Brook Kennel.

"NEW YORK KENNEL CLUB."—We have been asked by some Southern correspondents if we know anything of a Mr. J. B. Fraley of the "New York Kennel Club." We know nothing of the man nor of the club. If there is any such club we should be glad to hear from it.

A SMALL SPECIMEN.—A correspondent at Hot Springs, Ark., writes that he has a puppy nine months old that weighs only one pound and two ounces. Next!

KENNEL NOTES.

NOTICE TO CORRESPONDENTS.

Kennel notes are inserted in this column free of charge. To insure publication of notes, correspondents MUST GIVE the following particulars of *each animal:*

1. Color.
2. Breed.
3. Sex.
4. Age, or
5. Date of birth, of breeding or of death
6. Name and residence of owner buyer or seller.
7. Sire, with his sire and dam.
8. Owner of sire.
9. Dam, with her sire and dam.
10. Owner of dam.

All names must be *plainly* written. Communication on one side of paper only, and signed with writer's name.

NAMES CLAIMED.

☞ *See instructions at head of this column.*

Hickory Rod, Mystery, Valley Belle and Monogram. By E. W. Jester, St. George's, Del., for black, white and tan English setters, two dogs and two bitches, whelped July 11, 1885, by Roderigo (Count Noble—Twin Maud) out of Merry Belle (Gladstone—Bessie A.).

Lady Glen and Lady Pearl. By Detroit Kennel Club, Detroit, Mich., for liver and white pointer bitches, whelped March 20, 1885, by their champion King Bow (A.K.R. 83) out of Sue (Hindoo—Princess Bow).

Dave Sanborn, Doncaster II., Princess Zeba, Countess Blanche and Lady Doncaster. By Detroit Kennel Club, Detroit, Mich., for blue belton and lemon belton dogs and blue belton, lemon belton, and white, with black spot, English setter bitches, whelped March 6, 1885, by Doncaster (Druid—Nilsson) out of Princess Louise (A.K.R. 117).

Fort, Fleet, Empress Loureene and Countess Vashta. By Detroit Kennel Club, Detroit, Mich., for pointers, two liver and white dogs, one liver and white and one lemon and white bitch, whelped May 29, 1885, by Bodine (Bow—Jaunty) out of Ruby Croxteth (Croxteth—Lass).

Trailer II. By Dr. M. F. Young, Littleton, N. H., for black, white and tan beagle dog, whelped February, 1885, by Bounce out of imported Myrtle.

Max, Mo, Mikado, Fuss, Gem, Jewel and Miss Ruby. By City View Kennels, New Haven, Conn., for pugs, three dogs and four bitches, whelped July 18, 1885, by Bradford Ruby out of Flossy (A.K.R. 2250).

Noble Petrel. By Rancocas Kennels, Jobstown, N. J., for black and white and ticked English setter dog, whelped June 4, 1885, by Count Noble (Count Wind'em—Nora) out of their Petrel II. (A.K.R. 2063).

Bay State Kennels. By Dr. H. K. Surles, for his kennels at Worcester, Mass.

BRED.

☞ *See instructions at head of this column.*

Prue—Leo. Mr. Newell's (Doylestown, Pa.) mastiff bitch Prue (Turk II.—Madge) to Harvey's Leo (Surajah—Lena).

Flounce—Gladstone. J. W. Murnan's (Keeling, Tenn.) English setter bitch Flounce (Druid—Ruby) to P. H. Bryson's champion Gladstone (Dan—Petrel), June 29.

Erie—Tammany. H. F. Rivers's (Bridgeport, Conn.) pointer bitch Erie (Rake II.—Browny) to F. R. Hitchcock's Tammany (Tory—Moonstone), July 30.

Fanny—Dick. Miss Edith M. Van Buren's (Englewood, N. J.) imported Italian greyhound bitch Fanny to H. C. Burdick's imported Dick, July 4.

Little Nell—Bruce. I. H. Roberts's (Moorestown, N. J.) red Irish setter bitch Little Nell (A.K.R. 2179) to his Bruce (A.K.R. 54), July 19.

Lavalette—Count Noble. Rancocas Kennels' (Jobstown, N. J.) English setter bitch Lavalette (A.K.R. 2353) to Count Noble, July 30.

Gussie—Dashing Monarch. Rancocas Kennels' (Jobstown, N. J.) English setter bitch Gussie (Ben—Nettie) to their Dashing Monarch (A.K.R. 2348), July 16.

Pearl Blue—Gun. Chas. York's (Bangor, Me.) English setter bitch Pearl Blue (A.K.R. 1542) to his Gun (A.K.R. 1538), June 15.

WHELPS.

☞ *See instructions at head of this column.*

Diamond II. Bay State Kennels' (Worcester, Mass.) pug bitch Diamond II., July 28, eight (four dogs), by their imported Duke II.

Flirt. Bay State Kennels' (Worcester, Mass.) imported pug bitch Flirt, Aug. 2, nine (eight dogs), by their imported Duke II.

Chubby. Bay State Kennels' (Worcester, Mass.) pug bitch Chubby (——— —Ruby), Aug. 5, eight (five dogs), by their imported Duke II.

Ruby. Bay State Kennels' (Worcester, Mass.) imported pug bitch Ruby, April 7, eight (six dogs), by their imported Elco.

Dashing Jessie. E. W. Jester's (St. George's, Del.) English setter bitch Dashing Jessie (A.K.R. 816), Aug. 1, three (one dog), by his Glen Rock (A.K.R. 1616).

Queen Alice. Howard Hartley's (Pittsburgh, Pa.) English setter bitch Queen Alice (A.K.R. 2296), Aug. 3, six (four dogs), by Count Noble.

Spot. Dr. M. F. Young's (Littleton, N. H.) beagle bitch Spot (Hector—Shoo Fly), June 21, three (one dog), by N. Elmore's Gyp (Racket—Fly).

Lillie Langtry. Thos. W. Mills's (Montreal, Can.) bull bitch Lillie Langtry (A.K.R. 2453), Aug. 1, eight (seven dogs), by his Guillermo (A.K.R. 671); white and white with brindle head.

Princess Ida. Thos. W. Mills's (Montreal, Can.) bull bitch Princess Ida (A.K.R. 2454), Aug. 2, five (one dog), by his Guillermo (A.K.R. 671); white and brindle and white.

Ruth. J. A. McDonough's (St. Louis, Mo.) English setter bitch Ruth (A.K.R. 827), July 24, eleven (six dogs), by his Count Glickstone (Royal Blue—Modjeska).

Diamond. Bay State Kennels' (Worcester, Mass.) imported pug bitch Diamond, April 14, six bitches, by their imported Elco.

Ruby II. Bay State Kennels' (Worcester, Mass.) pug bitch Ruby II. (——— —Ruby), July 22, five (two dogs), by their imported Duke II.

Dot. Bay State Kennels' (Worcester, Mass.) black and tan terrier bitch Dot (——— —Midget), June 19, three (one dog), by Wood's Dot.

Gip. Bay State Kennels' (Worcester, Mass.) imported black and tan terrier bitch Gip, June 30, four (two dogs), by their imported Dandy.

Mistletoe. J. H. Houston's (Stuart, Neb.) pointer bitch Mistletoe (A.K.R. 1254), Aug. 2, nine (one dog), by Bruce II. (A.K.R. 695); liver and white; four bitches and dog since dead.

Lady Clare. I. H. Roberts's (Moorestown, N. J.) red Irish setter bitch Lady Clare (Elcho—Rose), July 19, ten (seven dogs), by Blarney (Bruce—Luray).

Coomassie. Rancocas Kennels' (Jobstown, N. J.) English setter bitch Coomassie (A.K.R. 949), Aug. 2, two (one dog), by their Dashing Monarch (A.K.R. 2348); black and white dog, black, white and tan bitch.

SALES.

☞ *See instructions at head of this column.*

Donald II.—Lady Bang (A.K.R. 698) whelps. Liver and white pointer dogs, whelped June 28, 1885, by Clifton Kennels, Jersey City, N. J., to G. W. Lahue, New York, and one to Mortimer Mills, Jersey City, N. J.

Fanny C. Black and tan beagle bitch, age not given (Lead—Fanny), by E. W. Jester, St. George's, Del., to J. C. Vail, Warwick, N. Y.

Dora Thorn. Black, white and tan English setter bitch, whelped July 22, 1884 (Nixey—Princess Louise), by Detroit Kennel Club, Detroit, Mich., to Jerry Cockrell, Memphis, Tenn.

Doncaster—Princess Louise (A.K.R. 117) whelp. Lemon belton English setter bitch, whelped March 6, 1885, by Detroit Kennel Club, Detroit, Mich., to R. Cogar, Mt. Sneffels, Col.

Lexington—Kelp (A.K.R. 110) whelps. English setters, whelped May 15, 1885, by Detroit Kennel Club, Detroit, Mich., a liver and white dog to Wm. Jarvis, same place; a black and white dog and a liver and white bitch to Wm. Borden, Chicago, Ill.

Gyp—Spot whelp. Black, white and tan beagle dog, whelped June 21, 1885, by Dr. M. F. Young, Littleton, N. H., to F. H. Twitchell, same place.

Storm. Black, white and tan English setter dog, whelped September, 1883 (Carl—Countess Vesta), by E. H. Lathrop, Springfield, Mass., to L. H. Mayott, same place.

PRESENTATIONS.

☞ *See instructions at head of this column.*

Flossie Belle. Red Irish setter bitch (A.K.R. 2433), by J. Middleton, Washington, D. C., to Thos. Taylor, Four Mile Run, Va.

Lady Bub. Black spaniel bitch (A.K.R. 998), by H. F. Schellhass, Brooklyn, N. Y., to D. C. Frank, Tremont, N. Y.

DEATHS.

☞ *See instructions at head of this column.*

Miss Romp. White and black imported pointer bitch, 4yrs. old (Mike—Romp), owned by Field Trial Kennels, Charlottesville, Va., Aug. 1, accidental hanging.

Gladstonekoff. Brindle bulldog, 5½yrs. old (Gamester—Miss Nipper), owned by J. P. Barnard, Jr., Boston, Mass.

KENNEL MANAGEMENT.

☞ **No Notice Taken of Anonymous Correspondents.**

B., Brewer, Me.—I have a fine dog that I think a great deal of, but he has one trouble; that is, he sheds his hair the year round. He is a young dog, short hair, thin coat. Will some of the many readers of your valuable paper give a remedy through its columns that is not injurious? Ans. Wash your dog every other day with Glenn's sulphur soap and warm water and dry thoroughly after washing.

J. N., Pittsford, Vt.—A setter dog six years old has wintered here in Vermont, and has developed an enormous coat of hair. It is from four to five inches long all over his body, and he shows no disposition to shed it. His nose is very seldom cool and his eyes are bloodshot, very much so after running. Ans. Keep his bowels regular with spirits of buckthorn. Give him one pill of aloes and iron each evening and do not feed too highly. Give plenty of exercise and groom the dog regularly.

F. H. F. M., Ottawa, Ont.—1. One of my Clumbers, a bitch, swells in a most extraordinary way when in the water. She is a very good water dog and swims a great deal, and after being in for a couple of minutes her stomach swells double its natural size, with what seems to be wind, and forces her hindlegs out of the water and her head down, so that she cannot swim. When she comes out of the water she, in a wonderfully short time, assumes her natural proportions. She is generally very flatulent. Could you tell me the cause of this, and if there is any remedy for it? 2. Another Clumber licks his forelegs a great deal, keeping them very thin, which of course looks very bad in a Clumber. Can I do anything? Ans. 1. Flatulency is common in bitches. Give three drops of turpentine on small lump of sugar twice daily. 2. You might cure your dog of the habit by putting some mixture on his forelegs distasteful to him. This is better than the muzzle.

A. L. R., Allentown, Pa.—Will you please let me know what caused a mastiff dog to foam at the mouth and discharge a slimy substance, and what remedy, if any, I shall use? Is there any way of removing a hard crust, something like a corn, that has started to grow on the elbow joint of a mastiff dog owned by me? Ans. Your dog had a convulsion or fit. It may be due to a dozen causes, over-eating, overheating, worms, and other digestive troubles. Satisfy yourself of the absence of these causes, and if your dog has any more attacks report to us. You may burn off the wart with nitric acid; but if it is on a part that is constantly irritated in lying down or scratching, you will have to be careful during treatment that the part is protected and that in future the dog does not irritate it, otherwise it will return. The acid should be applied on a match stick with a little ball of cotton at its end. Shave off all you can first with a sharp knife. Apply once daily.

L. F. H., Oswego.—My Newfoundland puppy, three months old, has broken out with small sores from the pit of his stomach to the base of tail, and on the inner side of his hindlegs. He digs and bites constantly. I examined him and found his belly covered with fleas, which I rid him of by using insect powder; I have washed the sores with castile soap and they appear to be better, but spread. He is in splendid spirits and his general health is good. He goes into the water very often, five or six times a week. The sores scab over and heal up; they are the size of a large pin head, and are filled with yellow matter. The hair falls off where they appear. Ans. Your puppy suffers from a pustular eczema, which is one form of mange. Sponge his belly carefully with warm water and carbolic or castile soap, then after drying dust on a powder made of equal parts of zinc oxide and white precipitate (ammoniated mercury). You may prick any pustules which form with a needle. You may give Fowler's solution of arsenic in the food twice daily in three-drop doses for three weeks.

Rifle and Trap Shooting.

Address all communications to the Forest and Stream Publishing Co.

THE "FOREST AND STREAM" RIFLE TRIAL.

Editor Forest and Stream:

I beg to tender you my most hearty thanks and approval of your settled purpose to have a trial this coming fall of the different hunting rifles now in general use, for height of trajectory, and, of course, target. As you say both a flat curve and a good target must combine to constitute a good hunting rifle. I have often repeated this fact in your columns and given the reasons for it, so I pass on.

In making this trial you touch upon the very keynote of rifle shooting. Thousands of hunters all over this continent will rejoice at your liberal and unselfish proposition, and await with great anxiety and much patience your most valuable report. Such a trial has been greatly wanted by hunters and others for many years, and the public, with a few exceptions, will now greatly rejoice that it is to be forthcoming. Your most able and very reliant correspondent, "P.," has already sent to your columns a most valuable series of experiments which he made near three years ago in Montana, and he there recommended just such a trial as you now propose to make and I strongly approved of it. In a recent published letter he renews the same, and says that all makers of rifles should first carefully and truly test them, and then warrant them to perform according to the test and "tag" affixed to each. I most heartily concur in this and so will all rifle shooters in America. I am free to say that a rifle which cannot be accurately tested and then sold under a warrant of the test is not the kind of rifle I would buy or have in possession.

But I wish particularly to say, that I think the trial range should not be over 150yds. at most, and that 100yds. would suit my views better, still 150yds. is very well, but 200yds. is too great for ordinary hunting rifles. This, you say, is to be a general test for hunting rifles as used in this country. Now all old hunters will agree that to shoot at any kind of game over about 100yds., as a rule is very unwise and a losing business. Also that they shoot at game, large and small, nine times in ten within 100yds., and this because they do not wish to run the chances of losing the game by shooting at it up to 100yds. Indeed, when we come down to the practical facts, more deer are shot within 75yds. than over it. and thus for all larger game as a rule. As to small game, squirrels, crows, hawks and the like, they are generally shot within 25 to 60yds., and always remember that small animals are hunted ninety-nine times to one of large animals. Thus it is evident that hunting rifles should be confined to short ranges, and it is right here we should certainly know how they shoot. A range longer than 150yds., and even of 150yds., will serve to exclude from the trial many small bores which make the very best (and are the most sought after) hunting rifles for small game up to 75 or 100yds. The small bores are the most popular and sought after, because the game is generally small and the ammunition cheap. Try to not exclude the most popular hunting rifles of all—I mean close-shooting rifles for short distances. These are what the majority of shooters prefer, hence a trial for 200yds. is altogether too great.

One other point. I assume that you intend to report the target, of course. And this, because if the rifle does not shoot steady, then a flat curve is useless. The essentials of a good rifle are:

1. Steadiness in shooting.
2. A flat curve, so as not to shoot over and under.
3. Sufficient power to kill the game you wish to hunt.
4. As little recoil as possible.

Mark well that steadiness and a flat curve must unite in the same rifle, in order not to render it next to worthless in hunting, especially for all small game.

As to the target, I will say thus: The English in a like trial for a hunting trajectory and target, made near London in the fall of 1883, arrived at the target in this way. They used for the measurement of the cluster square inches. After the shooting was made, they drew four straight lines at right angles to each other in such a way as to include the outer centers of the trial bullet holes. This gave them the height and breadth of the target, and when these were multiplied together, it gave the result in square inches and decimals of inches, the size of the target was only the cluster of shots, in fact. I think they reported the string of the cluster also. A cluster, of course, shows the same steadiness of the shooting, whether it be outside of or around the center of a target.

In a trial for trajectory the cluster method is best, I think, for the bullseye is not seen when screens are used; and as the trial is to be one of machine (constant) rest, with no change of elevation or aim, of course each bullet should follow the other into the same cluster, if not bullet hole.

The English selected 150yds. as the limit of range, and if you select the same it will bring the English experiments into your own table, and thus they become useful as comparisons. Six English manufacturers entered their rifles for competition at this trial, which was gotten up and supervised by the editor of the London *Field*, who reported on the same very fully in his columns. The names of those who entered are Tho. Bland & Sons, Messrs. Holland, Adams, Tranter, Jeffries and Watson. The invitation was made general, but as it was not availed of by all English manufacturers it looks as if some f them dared not to test their rifles.

Nearly eighteen months ago, in writing about this trial, which was published throughout this country, I said: * * * "I desire to thank you * * * for bringing before the public the valuable results of the recent rifle experiments which have been made at Putney and Nunhead, England, * * and for the purpose of testing the qualities of different hunting rifles and placing the results and their trajectories fairly and squarely on record, so that the public may clearly understand them. Such experiments carefully made form the very essence of all rifle shooting, and without such the shooter of the rifle may grope in darkness all his life.

"* * * Most heartily do I commend this course of trials to all American manufacturers of the hunting rifle. Each and all of these seem to claim his own to be the best, and therefore they should not be afraid to enter them in a general contest.

"I am glad that a few English makers have been consistent exough to come thus squarely to the front to test the shooting qualities of their rifles, and we truly hope to see our American manufacturers not less consistent and brave than the English * * * Will they not then follow where the English have led, and so demonstrate to the world what their hunting rifles can actually do? This exact knowledge is just what the public wants, and I unhesitatingly say that every American hunter will gladly clap his hands with joy to learn who makes the best general hunting rifles, that is, for both large and small game * * * Now the best hunting rifle for general purposes is that which makes the flattest curve and shoots the steadiest within ordinary hunting ranges * * * Gun trials, as you see, lie right at the foundation of all rifle shooting, and I hope to see others coming forward to indorse them. But all rifle trials should, and must be made with much care, and disinterestedly, to be of value."

Thus I wrote then and not one even has responded to the good cause. It now remains for you, Mr. Editor, to do up this most praiseworthy work, and sincerely I hope you will do it (as I have no doubt you will) most thoroughly and right on the square. I give you my heart and hand in this matter and may you push boldly forward to the end. Maj. H. W. Merrill.

P. S.—After more mature consideration I come to the conclusion that the rifles should be tested at 200yds., this is the distance that "P.," and Mr. Rabbeth and others have used, and many wish to know this trajectory. Hence I recommend for each rifle 15 shots as follows:

Five at 200yds., 3 screens, at 50, 100, 150 to target.
Five at 150yds., 3 screens, at 37½, 75, 37½ to target.
Five at 100yds., 3 screers, at 25, 50, 100 to target.

This will meet all cases from the light to the heavier hunting bullets. Each distance is about equally important, though practically 100yds. is the most important, because, say 19-20 of the game killed is shot within this distance. Such a trial will be very valuable, as it will settle the matter of any rifle definitely. H. W. M.

Editor Forest and Stream:

I am glad to note that you are about to make a practical test of the trajectories of our sporting rifles. Your editorial of Aug. 6 is sound from beginning to end, and your plans as far as mapped out are beyond criticism. As you invite suggestions, I will offer a few. 1. The rifles should conform to the rules of the National Rifle Association of America as regards weight, trigger pull and sights. 2. No paper-patched bullets should be allowed, nor any style of cartridge in which the bullet is not seated in the shell a sufficient distance to make the ammunition portable and trustworthy under any ordinary conditions, such as are met with in hunting. Muzzleloaders should be allowed a cloth patch such as is generally used in this class of weapons. 3. Breechloaders should use a cartridge such as is recommended by the manufacturers of the rifle, providing it comes within the conditions as above stated. If no such ammunition is furnished, the rifle should be excluded from the test. Muzzleloaders should not be overcharged with powder. A normal charge, such as is used in shooting game, should be selected, and a charge which would produce excessive recoil in a ten-pound rifle, endanger the bursting of the barrel, or cause wild shooting, should not be allowed. 4. The distance should be 200yds. 5. Twenty shots should be fired without wiping out the rifle, and the time consumed in firing the twenty shots should not exceed thirty minutes. It should not be compulsory upon the shooter to load the rifle; an assistant may be appointed to do this part of the work. 6. A record of the accuracy of each rifle should be kept, so that it may be known whether the comparative flatness of trajectory has been obtained at the expense of accuracy or not. I invite criticism of these suggestions, and hope this subject may be fully discussed. E. A. Leopold.

Norristown, Pa., Aug. 10.

RANGE AND GALLERY.

JAMESTOWN, N. Y., Aug 3.—Score of Jamestown Rifle Club in match with Waltham, Mass. Creedmoor target, 200yds., off-hand. Telegraph match shot July 31:

H V Perry	5 4 4 3 4 5 4 4 5 5—43		
S N Ayres	4 5 5 4 4 4 5 4 4 5—44		
F K Dowler	4 4 4 4 4 5 1 5 4 2—40

		R. H. Burns.	

NATIONAL RIFLE CLUB.—The twenty-eighth annual meeting of the club will be held at Vernon, Vt., Sept. 1 and 2. A general invitation is extended to all interested in rifle shooting. Any one can become a member and entitled to all the privileges of the club by paying $5 entrance fee to the match for prizes and club medal. The standard weight of rifle barrels being fifteen pounds, all over must give the following odds: From 15 to 20 pounds, ¼ inch to the pound for every 10 shots; from 20 to 30 pounds, 3-16 inch; from 30 to 40 pounds, 1-16 inch. Ten per cent. odds will be allowed to parties shooting from the shoulder. First string will be shot Tuesday afternoon, second and third strings on Wednesday. Distance 40 rods; time rules.—N. S. Brockway, Secretary, Bellows Falls, Vt.

HAVERHILL, Aug. 8.—To day's shoot was well attended, and the weather conditions were very good. Scores:

J Bushfield	4455555445—46	E Bray	4455444444—42
W Worther	5545544554—46	F Merrell	4444445444—41

C Brown	4445544454—43	J M P Green	4443453344—38
E Brown	5345454454—43		

The Merrimack Rifle Club visited the range Aug. 1, and a very pleasant shoot was held. A team match of 10 men was shot and the home team got left. The visit will be returned about the first of September.

BOSTON, Aug. 6.—There was a small attendance of riflemen at Walnut Hill to-day. In the militia match, Private L. Grant, Company D, 1st Cadets, made 92, completing four scores of 21 or better, thus winning the silver badge. For long-range shooting the conditions were unfavorable, a changeable light and wind bothering the riflemen considerably. The scores:

Rest Match "F."

THE COMING GUNPOWDER.—The gunpowder question is still exercising the minds of the authorities, says the London *World*, and a few years will no doubt see a great change in the nature of the explosive. The new brown cocoa compressed powder will soon be universally in use with our newest breechloading guns; and experiments have been tried lately at Rottwiel, where this powder originally appeared, with a compressed powder of fine grain, which is reported to have given most wonderful results when fired in a rifle. Another inventor has patented a powder which is to be manufactured and stored in a liquid form. to be evaporated when required for use, the great advantage claimed for this being that the danger in manufacture is greatly lessened.

MINNESOTA.—The fifth annual meeting of the selected riflemen of the department of Dakota opened on the 6th at Fort Snelling under the direction of Lieut. L. R. Hare, the department inspector of rifle practice. The men, to the number of 200, are all on the ground, having come in during the past week singly and in detachments from the several posts in the department. Of the number mentioned there are 120 riflemen, the remainder comprising the range officers, scorers, markers, cooks and orderlies. The first three days will be devoted to preliminary practice. The morning firing will begin at 8:45 and the afternoon shooting at 1:30. The prize for the highest aggregate score made during the three days' practice is an elegant gold badge offered by Victor Robertson of Fort Snelling. It is valued at $75, and is one of the handsomest badges ever offered in a department contest.

WATER GUN.—A Grand Rapids, Mich., paper of a recent date gives an account of the trial of a water gun. J. L. Shaw, the inventor, conducted the exhibition. The patentee claims to be able to break in a window protected by slats, or throw a life line over any house in the city. The instrument is practically on the same principle as a rifle, water, however, being the motive force. The bullet was thrown about 140ft. and the life line about 40ft. in height. The pressure of the water was not sufficient to fairly test the aparatus. As far as it went the water gun was a success.

CLUB SCORES.—*Correspondents who favor us with scores are requested to send them in as soon as possible after the matches described. We go to press Wednesdays; and it is necessary that matter for publication should be in hand by Monday, or Tuesday at the latest.*

VARIOUS MILITARY ARMS.—As I understand the rule, any military gun may be shot in matches between militia companies if desired. The members of any team may use several different makes of military rifles, if covered by N. R. A. rules. For instance, the American team shooting the English used several makers.—X. (Tacoma, W. T.). [Unless the rules require the use of the arm formally issued to the company represented by the team, there is no objection to the use of a variety of military rifles in the same team.]

RIFLE NOTE.—The annual matches of the Ontario Rifle Association open on the Garrison Common Ranges, Toronto, Aug. 24. A long series of competitions has been arranged, and the prospects are for a very successful meet.

DRESDEN TURN FEST.—Of the 37 prizes given at the Dresden turn fest, four fell to America, and three of the four were won by Newarkers. W. Grant won the twenty-eighth prize with a score of 50⅝ points. Gustave Ahl won the thirty-fifth by 49⅛ points. Henry Freeman won the thirty-sixth by 49 points. The fourth winner was Charles Hartman, of San Francisco, who took the lowest prize by a score of 49 points. The highest prize was won by a score of 61⅛ points by a Berlin turner.

The Knoxville Blackbird has been adopted by the South End Gun Club. At the recent tournament a thorough trial was given them, and they were found far superior to the Peoria bird. The flight of the Knoxville bird is much longer, and they are less liable to break when thrown from a trap.—*Worcester (Mass.) Spy, July 30, 1885.*—*Adv*

THE TRAP.

HOW TO AWARD THE PRIZES.

Editor Forest and Stream:

The Glass-Ball Club held a shooting match July 4, the prizes to be awarded according to sweepstake rules. The following is the score, 7 singles and 4 pair doubles:

James Gregory	1 0 0 0 1 1 0	00 00 10 10— 5
Cal Winslow	1 0 0 1 1 1 1	00 10 10 10— 8
A L Hamilton	1 1 0 1 1 1 1	11 10 10 10—11
J W Gray	1 1 1 1 1 1 1	11 01 00 11—12
H C Vinal	0 1 0 0 1 0 0	10 10 11 01— 7
E L Rolfe	0 0 1 1 0 1 1	11 11 11 10—11
Frank Roberts	1 0 1 0 1 1 1	10 10 10 00— 8
H A Arey	1 0 1 1 1 1 1	11 10 10 11—12
J G Craig	1 1 0 0 0 1 1	11 11 10 11—11
Fred Killman	1 0 1 0 0 0 0	10 00 00 00— 3
George Murray	0 0 1 0 0 1 1	10 10 00 10— 6
J H. Hamilton	1 1 0 1 0 1 0	10 10 11 01— 9
F W Kitteedge	0 0 0 1 0 0 1	withdrew.
R C Gray	0 1 0 0 0 0 1	10 01 01 00— 5
J P Amburst	1 0 0 0 0 0 0	00 00 10 10— 3

There are four prizes to be awarded to the four best scores. We are not familiar with sweepstake rules, and will hold the prizes till the scores are published in your valuable paper and you inform us how to shoot off the ties. J. G. C.

Vinal Haven, Me., Aug. 3, 1885.

[In the score there are two ties of 12 and three of 11, a single 9, and two ties of 8. The prize winners may be determined in two ways: 1. Ties of 12 shoot off at a certain number of balls, say three each, and the one who makes the best score takes first prize and the other second. Then those who tied on 11 shoot off, and the one making best score takes third and the next one fourth. 2. In class-shooting, the usual style, the ties of 12 shoot off, the one making best score taking first prize and the other man getting nothing. Ties of 11 shoot off, best man taking second; third goes to the score of 9, and ties of 8 shoot off for fourth.]

NEW HAMBURG, Canada, Aug. 7.—The members of the Hamburg Gun Club met on Thursday to shoot a walking match, 15 clay-pigeons, Ligowsky screened trap, first notch, 25yds. to 12yds. This first attempt caused a great deal of fun. Score:

T Puddicombe	0110111011010110—10	F Bourne	0001111011110110— 9
A F Spring	0101110110011110— 9	I Claucy	0101011001101101— 8
S G Holley	1011110110111101—11		

CLUB SCORES.—*Correspondents who favor us with scores are requested to send them in as soon as possible after the matches described. We go to press Wednesdays; and it is necessary that matter for publication should be in hand by Monday, or Tuesday at the latest*

MOBILE GUN CLUB.—Monthly handicap shoot for club meda; Stewart at 21yds., rest at 21yds.; 15 balls, 3 traps:

Finch	111111111111111—15	Boltz	111110111101011—12
Stewart	111111111111110—14	Sartore	0101011111
McDonnell	101011110111111—12	Drey	111110010

Team shoot, 15 leather-wing bats, 7 singles at 21yds., 4 doubles at 18yds.:

Team No. 1, G. Boltz, Capt.		Team No. 2, J. F. McDonnell, Capt.	
Boltz	0111111 11 11 11 10—13	McDonnell	1011001 01 00 11 11— 9
Drey	1100101 11 10 10 00— 8	Custa	1001100 11 11 01 11—10
Sartore C.	1010111 11 11 10 00—10	Wagner	1010111 10 10 11 11—11
Sartore J.	1111100 01 01 01 11—10	Dumont	1111001 11 10 11 11—12

CLUB SCORES.—*Correspondents who favor us with scores are requested to send them in as soon as possible after the matches described. We go to press Wednesdays; and it is necessary that matter for publication should be in hand by Monday, or Tuesday at the latest.*

NEW ENGLAND TRAP-SHOOTERS' ASSOCIATION.—The third grand tournament will be held at Exeter, N. H., Aug. 27 and 28. The individual match will occur on Thursday, at 2 P. M., and the team match on Friday, at the same hour. Entrance free, sweepstakes optional. The Exeter Sportsman's Club will donate special prizes for these matches. Five clay-pigeon traps will be devoted to sweepstakes, entrance $1.50 to $5. Also traps for fancy targets for sweepstakes, entrance 50 cents. From 9 A. M. to 7 P. M., each day.—C. H. Bickford, Sec'y, Exeter, N. H.

NEW ORLEANS, Aug. 1.—A challenge match was shot to-day between the Crescent and Southern Gun Clubs, of New Orleans, at the City Park. The match was to be decided by eighty single clay-pigeons and forty double bats. The Southern Gun Club came out victorious by a majority of five on clay-pigeons and seven on bats. After the challenge match there was a pool shot for duck decoys. These were won by Mr. F. Cardona, of the Southern Gun Club. The Southern Gun Club desires to hear from any club whose members are under the age of twenty three. Address all challenges to F. Cardona, care of S. Hernsheim & Bros., corner Julia and Magazine streets.

National Gun Association Tournaments.—Special Notice.—Members desirous of organizing tournaments in their vicinity, under the auspices of the Association, are requested to notify the undersigned. All the expenses of the same will be paid by us. Make your arrangements for 1886. We propose to establish a circuit of tournaments annually. Claim your dates now.—F. C. Bishop, Secretary, Box 1292, Cincinnati, O. Send 10 cents for hand book containing rules, constitution, etc. "Fairly started and its future depends entirely upon the manner in which the sportsmen throughout the country respond."—C. M. Stark, April 18, 1885.—*Adv.*

Canoeing.

Address all communications to the Forest and Stream Publish ing Co.

Canoeists *are invited to send us notes and full reports of cruises club meets, information about canoeable waters, and other communications of interest.*

Secretaries of canoe clubs are requested to send to Forest and Stream their addresses, with name, membership, signals, etc, of their clubs, and also notices in advance of meetings and races, and reports of the same. Canoeists and all interested in canoeing are requested to forward to Forest and Stream their addresses, with logs of cruises, maps, and information concerning their local waters, drawings or descriptions of boats and fittings, and all items relating to the sport.

FIXTURES.

Sept. 19—N. Y. C. C. Regatta, off New Brighton.

AMERICAN CANOE ASSOCIATION.

Secretary—C. A. Neidé, Schuylerville, N. Y. Candidates for membership must forward their names, with $2 for initiation fee and first year's dues, to the secretary, who will present the names to the executive committee. Money should be sent by *registered letter* or money order.

THE ASSOCIATION MEET—REGATTA WEEK.

CANOE CAMP,
GRINDSTONE ISLAND, Aug. 7.

SIX years of study and experiment by some of the leading American canoeists have brought canoe racing and the management of regattas to a high degree of perfection, and this year there is little cause to find fault with either the programme or the manner in which it was carried out, the only disturbance being that occasioned by the weather, which was very unfavorable. The changes made in the rules last season have all worked well, and we have heard of no suggestions of further amendment or alteration this year. The entries have been smaller than was anticipated, in consequence of the fewer members present, a fact that is due mainly, if not entirely, to the condition of business. While the entries in some races were few, all were well contested and an improvement in the average sailing and paddling, as the men were afloat, together with a closer attention to the rules than ever before, was very noticeable. The sailing races found all canoes with large numbers in their mainsails, and in paddling colored flags were carried. The courses were similar to those of last year, but further out and in better water, the sailing course being 1½ miles triangular, and the paddling ½ mile down the shore. The new average record was an important feature of this year's racing, and the programme was specially arranged with reference to it.

PROGRAMME.

FIRST DAY, MONDAY, AUG. 3.

No. 1. 9:30 A. M.—Paddling Class III., 1 mile.

No. 2. 9:45 A. M.—Paddling Class II., 1 mile.

No. 3. 10:30 A. M.—Sailing Novices Classes A and B, no limits to rig or ballast; open only to members who never sailed a canoe before 1885, 1½ miles.

No. 4. 11:30 A. M.—Paddling Class IV., 1 mile.

No. 5. 11:45 A. M.—Paddling Class I. (This race exempt from "1 man 1 canoe" rule) 1 mile.

No. 6. 1:45 P. M.—Sailing Class B, no limits ballast or rig, 3 miles.

No. 7. 2 P. M.—Sailing Class A, no limits ballast or rig, 3 miles.

No. 8. 3 P. M.—Paddling and sailing combined, Classes A and B (paddle ½ mile, sail ½ mile, paddle ½ mile, sail ½ mile, paddle ½ mile, sail ½ mile, on triangular course of ½ mile sides), 3 miles.

No. 9. 4 P. M.—Paddling tandem, Classes III. and IV., decked (canoes for this race must be decked on half their length), 1 mile.

No. 10. 4:15 P. M.—Paddling tandem, Classes III. and IV., open (only for paddlers who do not race in No 9), 1 mile.

No. 11. 4:30 P. M.—Upset Race; any Class II. or larger canoe (no special appliances allowed unless usually carried in cruising; at signal every canoe must be turned completely over), 200ft.

SECOND DAY:

No. 12. 9:30 A. M.—Paddling Class IV., cruising trim (canoe and load any material, to weigh 200 pounds or more), 1 mile.

No. 14. 10:30 A. M.—Sailing Class B, no ballast, 3 miles.

No. 15. 10:40 A. M.—Sailing Class A, no ballast, 3 miles.

No. 16. 11:40 A. M.—Paddling Class II., cruising trim (canoe and load to weigh 120 pounds or more), 1 mile.

No. 17. 2 P. M.—Sailing Class B, cruising rig (sail limited to 75ft., any ballast), 1½ miles.

No. 18. 2:10 P. M.—Sailing Class A, cruising rig (sail limited to 50ft., any ballast), 1½ miles.

No. 19. 3 P. M.—Paddling Class III., cruising trim (canoe and load to weigh 160 pounds or more), 1 mile.

No. 20. 3:15 P. M.—Sailing unclassified canoes, no limits ballast or rig, 1½ miles.

No. 21. 4:15 P. M.—Hurry scurry, with swim, 100yds. run, canoes moored 50ft. from shore, paddle 200yds.

No. 22. 4:30 P. M.—Gymnastics.

Second day of this programme will be Tuesday, Aug. 4, unless weather prevents or some of Monday's races are postponed, in which case Monday's programme will be finished, if possible, and the remainder of the day be devoted to special races or sports, and the second day will be Wednesday, Aug. 5. In the absence of wind the paddling will be called at their appointed times. Punctuality will be insisted on; no race will wait for any members. Any event delayed by lack of wind or by reason of the preceding one not having finished will be postponed to the same hour next day, and the next event started at its appointed time. All A. C. A. rules will be enforced.

"All-round record" with five prizes will be based upon all events in this programme except Nos. 3, 5, 9, 10, 20, 21, 22, that is upon 7 paddling, 5 sailing, and 1 combined. Every classified canoe (except Class I.) being eligible alike for 3 paddling races, 3 sailing and 1 combined. For No. 5 members may bring and use another canoe besides the one allowed under Rule II. for other events. First and second prizes in all events except No. 22.

The foregoing programme provides for races of all kinds, for those who have never sailed or paddled a canoe, for those who have extreme racing outfits, and for those who have only a cruising boat and rig, but their tendency is strongly in the direction of encouraging the all round paddling and sailing canoe, and specially to encourage paddling which is apt sometimes to be sacrificed to sailing powers. The first race on the programme was called promptly on time, but a little delay was caused by a steamer coming to the dock. The water was lumpy and a strong wind was blowing across the course.

Paddling Class III., 1 mile.

Invincible	M. F. Johnson	Toronto C. C. 15 30
Beatrice	Theo Dunham	Harvard C. C. 19 00
Hillcrest	Edwin Gould	Knickerbocker C. C.

Hillcrest started off quickly but at the third or fourth stroke paddle completely over. Both she and Invincible were open Canadian canoes 16x28, against which Beatrice, a heavy Racine, 14x28, had no chance, especially with Johnson in the lighter boat, but Dunham hung on bravely through the stern chase.

At the close rain was falling with more wind and the other races were necessarily postponed. The weather was very unpleasant, but all hands enjoyed themselves under canvas. At night the wind increased and several tents were blown down, the A. C. A. tent, scattering the mail, Vice-Commodore Rathbun's on Capitol Hill, and two of the Kingston tents, besides some others. The confusion was increased by three yachts driving on shore, all hands turning to and aiding in getting them under the lee near Delaney's. No serious damage was done and the tents were soon pitched again.

Tuesday morning was clear, but very cool, with a high wind and sea, but Race No. 2, Paddling Class II., 1 mile, was called on time, starting at 9:43:30 A. M.

Ariel	W. A. Leys	Toronto C. C. 13 50
Daydream	G. E. Edgar, Jr.	Newburgh C. C. 14 30
Irene	R. Baldwin	Ottawa C. C. 15 05

No others cared to start in such weather. The next race was No. 3, Sailing Novices, 1½ miles. Only three started at 10:37, two capsizing.

Flit	Henry Stanton	Knickerbocker C. C. 19 00
Emily	F. M. Turner	capsized.
Margaret	E. K. Dunham	Harvard C. C. capsized.

Mr. Stanton sailed a good race in weather when few cared to start, and when his competitors both capsized, and the excellent manner in which his boat was handled was more noticeable from the fact that he is a new hand in a canoe.

Paddling races 4 and 5 were postponed on account of the sea and wind, and at 2:06 P. M. the main race of the season, No. 6, Sailing Class B, no limit, three miles, was started. The weather was very heavy for such small craft, but seventeen started. Of these only eight finished, several upsetting, and more giving up before completing the course.

Sea Bee	C. B. Vaux	New York C. C. 50 30
Snake	R. W. Gibson	Mohican 52 00
Star	F. S. Rathbun	Deseronto 55 00
Isabel	Robert Tyson	Toronto
Grebe	B. W. Richards	Brockville
Freyja	C. F. Holdship	Pittsburgh
Daisy	G. O. Totten, Jr.	Essex
Verena	E. B. Edwards	Peterboro
Germaine	A. G. Webster	Harvard
Katrina	R. W. Bailey	Pittsburgh
Guenn	C. V. R. Schuyler	Brooklyn
Beatrice	Theo. Dunham	Harvard
Bertha	J. E. Mellen	Rochester
Aurora	C. A. Neidé	Mohican
Sofronia	F. F. Andrews	Rochester
Thetis	P. M. Wackerhagen	Mohican
Inertia	E. W. Brown	Knickerbocker

Sea Bee carried her racing mizzen forward and storm mizzen aft, winning easily under this rig.

The next race, No. 7, was for Class A, with the same conditions, starting at 2:16:30:

Nirvana	A. K. Nimick	Pittsburgh 0 55 30
Day Dream	G. E. Edgar, Jr.	Newburg 1 03 30
Irene	R. W. Baldwin	Ottawa Capsized
Irex	Ford Jones	Brockville Capsized

Though starting 10m. 30s. later, the little Nirvana, 14×38in., came in ahead of some of the larger boats in Class B.

Race No. 8, Sailing and Paddling, called out but three entries, starting at 4:20 P. M.:

Snake	R. W. Gibson	Mohican 0 50 20
Day Dream	G. E. Edgar, Jr.	Newburg 1 00 00
Aurora	C. A. Neidé	Mohican

Immediately after this race started, No. 9, Paddling Tandem, Classes III. and IV., decked, was started at 4:21, over a mile course:

Nellie	Jackson and Kipp	St. Lawrence 13 00
Gertie	Robertson and Schuyler	13 05
Jessie	Davis and Smith	St. Lawrence

Race No. 10, for Paddling Tandem, open canoes, had also three entries, starting at 4:40:

Invincible	Johnson and Wilkinson	13 00
Daisie	Shaw and Pitt	Peterboro 14 00
Ballyhack	Higgins and Martin	

Johnson and Wilkinson won easily.

Tuesday evening passed quietly in camp, with nothing to note, and early Wednesday morning the races were resumed, the first race being No. 12, for Class IV., in cruising trim, a minimum limit for canoes and load being fixed at 200 pounds; distance, 1 mile; start, 9:47:45:

Nellie	W. F. Kipp	St. Lawrence 11 30
Snake	R. W. Gibson	Mohican 12 35
Ballyhack	R. Martin	13 45
Germaine	A. G. Webster.	Harvard

No. 14 of the regular programme followed, starting at 10:40:20, with 13 entries:

Thetis	P. M. Wackerhagen	Mohican 51 40
Sofronia	F. F. Andrews	Rochester 56 40
Sea Bee	C. B. Vaux	New York 58 55
Grebe	B. W. Richards	Brockville
Verena	E. B. Edwards	Peterboro
Snake	R. W. Gibson	Mohican
Marion B	R. S. Oliver	Mohican
Star	F. S. Rathbun	Deseronto
Katrina	R. W. Bailey	Pittsburgh
Freyja	C. T. Holdship	Pittsburgh
Bertha	J. E. Mellen	Rochester
Isabel	Robert Tyson	Toronto
Aurora	C. A. Neidé	Mohican

In this race no ballast was allowed and canoes were limited to 15lbs. for weight of board and fittings.

Thetis	P. M. Wackerhagen	Mohican	51 40
Sofronia	F. F. Andrews	Rochester	56 40
Sea Bee	C. B. Vaux	New York	58 55
Grebe	B. W. Richards	Brockville	
Verena	E. B. Edwards	Peterboro	
Snake	R. W. Gibson	Mohican	
Marion B	R. S. Oliver	Mohican	
Star	F. S. Rathbun	Deseronto	
Katrina	R. W. Bailey	Pittsburgh	
Freyja	C. T. Holdship	Pittsburgh	
Bertha	J. E. Mellen	Rochester	
Isabel	Robert Tyson	Toronto	
Aurora	C. A. Neidé	Mohican	

In this race no ballast was allowed and canoes were limited to 15lbs. for weight of board and fittings.

The next race, No. 15, was for Class A under similar conditions, starting at 10:58:45:

Nirvana	A. K. Nimick	Pittsburgh	58 30
Irex	Ford Jones	Brockville	1 06 15
Day Dream	G. E. Edgar, Jr.	Newburgh	1 07 45
Nereid	H. W. Schafer	Essex	
Irene	R. W. Baldwin	Ottawa	
Nettie	W. L. Green	Knickerbocker	
Lady Jane	B. C. Bakewell	Pittsburgh	

Nirvana won again easily, with a long lead at the finish.

Race No. 16 was postponed and No. 17 for Class B cruising rig, 75ft., was started at 2:20 P. M. once around the course.

Snake	R. W. Gibson	Mohican	25 25
Katrina	R. W. Bailey	Pittsburgh	26 10
Thetis	P. M. Wackerhagen	Mohican	26 15
Grebe	B. W. Richards	Brockville	
Sea Bee	C. B. Vaux	New York	
Verena	E. B. Edwards	Peterboro	
Sofronia	F. F. Andrews	Rochester	
Guenn	C. V. R. Schuyler	Brooklyn	
Marion B	R. S. Oliver	Mohican	
Lorelei	E. C. Griffin	Knickerbocker	
Isabel	Robert Tyson	Toronto	
Flit	Henry Stanton	Knickerbocker	
Freyja	C. F. Holdship	Pittsburgh	
Aurora	C. A. Neidé	Mohican	
Inertia	E. W. Brown	Knickerbocker	
Daisy	G. O. Totten, Jr.	Essex	
Gertie	J. R. Robertson		
Wenonah	J. L. Rogers	Peterboro	

After eight minutes the Class A boats were started in a similar race, the Nirvana again winning and making better time than any boat in the larger class:

Nirvana	A. K. Nimick	Pittsburgh	24 10
Irene	R. W. Baldwin	Ottawa	30 30
Lady Jane	B. C. Bakewell	Pittsburgh	

In Race No. 19, Paddling Class III., cruising trim, not less than 160 pounds for canoe and load, two canoes started at 3:01:

Invincible	M. F. Johnson	Toronto	11 25
Hillcrest	Edwin Gould	Knickerbocker	11 32

Johnson with Gould close to him, but at the finish the former spurted and won:

A postponed race, No. 4, Paddling Class IV., was next called and started at 4 P. M. over a mile course:

Nellie	W. F. Kipp	St. Lawrence	13 00
Bijou	J. L. Jackson	Brockville	13 30
Snake	R. W. Gibson	Mohican	14 00
Gertie	J. R. Robertson		
Daisy	G. E. Totten, Jr.	Essex	
Verena	E. B. Edwards	Peterboro	

Race No. 20 was omitted for the time, and the Hurry Scurry race, No. 21, was called. The canoes were moored off the dock, and the course included a run of 100yds., a swim of 30yds., and a paddle of 200yds. Five canoes entered:

Gunz	G. B. Wilkinson	Brockville	
Invincible	M. F. Johnson	Toronto	
Lorna	E. A. Gardner	Knickerbocker	
Hillcrest	Edwin Gould	Knickerbocker	
Inertia	E. W. Brown	Knickerbocker	

Mr. Wilkinson was first to dive and first in his boat. Mr. Gould had some trouble with the knot in his painter, finally using his teeth to untie it, which delayed him greatly. Johnson paddled hard to beat Wilkinson, but could not do it.

During the day a number of photos of the camp were taken by Mr. S. R. Stoddart, of Glens Falls. In the evening a torchlight procession took place, the canoeists being armed with immense tin horns, and also with Chinese lanterns. After the parade all assembled about a high platform that had been erected for the use of Mr. Stoddart, where Mr. R. B. Burchard gave an imitation of the new statue of Liberty. Gracefully draped in a canoe tent, his head surmounted by a tin kettle, while he held aloft a torch, his manly countenance colored intermittently by red and blue colored fires, the sight was beautiful in the extreme. After maintaining a statuesque pose for a short time Liberty ended up with a breakdown and disappeared with a flying leap into the darkness just as the last of the red fire expired.

The first race on Thursday was No. 5, postponed from Monday, Paddling Class I., 1 mile, open to any canoe:

Maggie	M. F. Johnson	Toronto	12 00
Ariel	W. H. Leys	Toronto	12 22

The next race was No. 16, Paddling Class II., in cruising trim, 120 pounds minimum limit, called at 10:14 A. M.:

Ariel	W. A. Leys	Toronto	13 00
Irene	R. W. Baldwin	Ottawa	13 15
Day Dream	G. E. Edgar, Jr	Newburgh	

At 10:56:40 a extra shoe, 1 mile tandem, for any canoe; prize, a paddle given by Mr. Rushton:

Maggie	Johnson and Leys		9 50
Bijou	Kipp and Jackson		11 20
Viva	Pitt and Shaw		11 40

Mr. Hugh Neilson, of Toronto, offered a pin as a prize for a reaching race, any canoe, course 1 mile, which was started at 10:42 in a very light wind. Nirvana, A. K. Nimick, again won, many of the starters giving up and paddling home.

The last race on Thursday was No. 11, upset race, 200yds., with seven entries:

Sofronia	F. F. Andrews	Rochester.
Sea Bee	C. B. Vaux	New York.
Gunz	G. B. Wilkinson	Brockville.
Invincible	E. W. Brown	Knickerbocker.
Snake	R. W. Gibson	Mohican.
Verena	E. B. Edwards	Peterboro.
Hillcrest	Edwin Gould	Knickerbocker.

All upset quickly at the signal, but Andrews was first in and away, winning first place with Vaux second. Sofronia, Snake and Sea Bee being decked were easy to upset and right, but the others, all open canoes, had to be emptied first.

After dinner on Thursday the review of the fleet followed. Seventy canoes passed the dock, all under paddle, some of them "manned" by ladies. Paddling over to the east the sailing canoes set their canvas and returned, passing the flagship again. While such a display lacks the grandeur which a fleet of yachts under sail derives from mere size, it has a beauty of its own that is no less charming. Half a hundred little craft with bright hulls and glistening sails when viewed from the hill is as pretty a sight as is often seen on the water.

Thursday evening was set apart for the water parade and illumination, and in the afternoon lanterns were prepared and flags displayed. The Kingston tents were covered with flags and lanterns beside the letters R. M. C., formed of colored lamps. The Brockville C. C. devised a similar plan. Some tall stakes were driven into the ground and saplings were twisted about them forming the letters B. C. C. On the frame work small colored lamps were hung, the effect at night against the white tents being very pretty. The view at night from the water was very fine, strings of many colored lamps along the entire length of the camp, but it could not compare with that from the hill top. The fleet formed on the north side beyond the trees, coming from their shadow one by one, at the point near the dock. Each of the fifty canoes had a string of lanterns from stem to mainmast head, then to mizzenmast and down to stern, and as the heights of the masts varied, and some lines were taut and straight and others slack and curved, there were no two boats in the fleet precisely alike. As the dock was passed the leader curved to port, then to starboard, the others following at regular distances until the long line seemed a fiery snake against a sea of black, some such monster as only Doré could picture or Coleridge describe. In and out it wound its convolutions until at last it disintegrated into many small parts, each of which contained half a dozen or more globes of light which one by one died out and left the camp in darkness.

On Friday morning signs of breaking camp were plentiful on all sides. Some had already left and piles of baggage and packed canoes on the dock were awaiting transport to Clayton. A number of special prizes remained to be raced for, and the first event, a consolation race for those who had never won an A. C. A. race, was called at 10:08 A. M. The prizes were of the value of $15 and $5, to be selected by the winners, and were presented by Mr. J. H. Hull, president of the Brooklyn C. C. The course was 1½ miles, and the wind was very light. Five canoes entered, but three soon dropped back, the leaders being B. W. Richards in the Grebe and C. V. R. Schuyler in the Guenn. The former held a good lead on the windward work, but was passed by Guenn on the last leg with sheets off, Guenn winning by 1m. 15s. Times—Guenn, 45m. 20s.; Grebe, 46m. 30s.

Two prizes, a decorated paddle presented by Messrs. J. C. Wilson and Chas. Remmpson, and a spoon paddle presented by Mr. John Glendenning, the Toronto canoe builder, were offered for a 3-mile sailing race for cruising canoes.

Thetis	P. M. Wackerhagen	Mohican	0 58 30
Guenn	C. V. R. Schuyler	Brooklyn	1 04 30
Grebe	B. W. Richards	Brookville	
Daisy	G. O. Totten, Jr.	Essex	
Nereid	Henry Shafer	Essex	

The wind was light at 3:35 when the race started, and continued so all the afternoon. Thetis easily left Guenn and Grebe, beating them badly.

At 4:35, a sailing race for open canoes, 1½ miles, for a decorated rudder, given by Mr. Ira Davis, and a paddle, given by Mr. Rushton, was sailed.

Verena	E. B. Edwards	Peterboro	40 30
Viva D	R. W. Baldwin	Ottawa	

The final event was a portage race, ¼ mile paddle, carry over a fence and 100ft. on shore, for a "Dorsal Fin" camp kit.

Hillcrest	Edwin Gould	Knickerbocker	5 30
Wenonah	G. E. Totten, Jr.	Essex	5 45
Viva D	R. W. Baldwin	Ottawa	
Far Niente	Chas. A. Neidé	Mohican	
Dotakecare	C. Larom	Berkeley	
Verena	E. B. Edwards	Peterboro	

Mr. J. B. McMurrich, Oswego C. C., also offered a pair of marine glasses for the winner of the greatest number of sailing races, which were awarded to Mr. A. K. Nimick, of the Pittsburg C. C., who won the three first in Class A. The Nirvana, his canoe, is 14x28, designed and built in 1884 by Mr. W. P. Stephens, the only boat of this model ever built. Mr. Nimick also won the reaching race in the Katrina. Mr. J. L. Weller being absent, the races were in the hands of Messrs. Gibson and Wilkin, assisted by C. A. Neidé, Geo. Roger and H. L. Thomas as Judges; C. F. Earle as Clerk of the Course; W. H. Larom as Entry Clerk; F. L. Mix as Timekeeper and Starter, and Harold Morrow, Asst. As Chairman of the Regatta Committee the bulk of the work naturally fell to Mr. Gibson, and it is but fair to say that to him more than to any one else the success of the races is due. The labor of arranging a series of thirty different races, and of sailing them off in three days, is no light one, and the competitors are indebted greatly to all of the gentlemen named for the sport they have enjoyed.

After the first race on Friday morning the members were called to the meeting, which was held on the hillside under the trees, Commodore Oliver being in the chair. The register of the camp was called over and the reading of the minutes of previous meeting was dispensed with. Mr. Larom reported in behalf of the nominating committee, presenting the names of F. S. Rathbun, of Deseronto, for Commodore for 1885 and '86; R. J. Wilkin, Brooklyn, for Vice-Commodore; Geo. H. Parmele, Hartford, Rear Commodore; Dr. C. A. Neidé, for Secretary and Treasurer; Messrs. B.W. Richards, Brockville; Geo. Roger, Peterboro; and W. B. Wackerhagen, Mohican, for the Executive Committee. It was moved by E. B. Edwards that W. P. Stephens be empowered to cast one vote for the ticket as read. The motion was carried and Mr. Stephens deposited a vote, the above gentlemen being declared elected.

The Treasurer's report was then read and accepted, also a report of the Executive Committee on the subject of a Western branch. The Executive Committee consider that the interests of the Western members of the Association, as well as of Western canoeists generally, demand some provision whereby an annual meet may be held in the West as well as one in the East, so that all may be accommodated. In pursuance of this object the committee presented the draft of a new constitution and by-laws providing that at any time when the Western members make application, the Executive Committee may organize the Association in the form of an Eastern and a Western branch, both on an equal footing, the two to elect a Commodore and Secretary and Treasurer, each branch to have its own officers and annual meet.

The letter from the Western A. C. A. that appeared in the FOREST AND STREAM last week was read and discussed, the sense of the meeting being that as less than fifteen per cent. of the Western members of the Association were present at Ballast Island it would not be fair to the majority to accept these few at once as representing them. The constitution was adopted, to take effect when the Executive Committee consider it advisable. The Western members and all Western canoeists will be asked to decide for themselves whether they will accept the Western Association organized at Ballast Island, as their representative, or whether they prefer to organize in some other way, and when their decision is made the committee will at once be ready to arrange with them the details of the change. The constitution as adopted is similar to the one published in the FOREST AND STREAM some time since. We will publish it in full shortly.

Secretary Neidé reported that the expenses of the Association, especially the meets, had so increased, that it would be necessary to raise the dues to $2 per year. Mr. Wilkin moved that the dues be raised, which motion was carried. Votes of thanks were passed to Albert Dennis Post, G. A. R., for the loan of their cannon; to Mr. Delaney, for the use of the camp ground; to Mr. Gibson and his assistants, and to the donors of the prizes. The following letter from Mr. W. Baden-Powell to Com. Oliver, was read by the Secretary:

3 PAPER BUILDINGS, TEMPLE, E. C.,
LONDON, JULY 22, 1885.

The Commodore American Canoe Association:

MY DEAR SIR,—Allow me to offer congratulations to the officers and members of the American Canoe Association.

Thanks to your excellent publications, the *Canoeist* and FOREST AND STREAM, we in England are kept well informed of all that is going on in American canoeing; and were it not for the difficulty that your meet is three weeks too early for us to join, our almost universal English holiday commencing Aug. 10, I should at this moment be in contact with you not by "mail," but hand in hand.

None the less I wish the A. C. A. all success at this meet, and shall hope to hear all about it in FOREST AND STREAM, and perhaps see the "cracks" by photograph.

I have watched with great pleasure the growth of sailing canoes in America, both as to number, size and sail area, and it bears out completely what I ventured to predict here nearly years ago, and in *Brentano's Monthly* in 1880: That when once a canoeist becomes an expert sailor and has obtained an efficient sailing canoe, he has tasted a "loving cup" of nautical brew of the finest brand, and he will not easily be drawn off that cup.

But if there is the slightest touch of "lubber" in his constitution, his canoe will find it out, and you will not often see him "under sail," except, perhaps, when he is under water at the same time.

Will the A. C. A., however, permit me to suggest that to keep this "cup" within popular taste, it is necessary to define the proportions of all its ingredients. Size, weight and sail area are the three governing qualities; the two former are limited, but if sail area is longer left unlimited, it will, in particular cases, increase to abnormal proportions and the pastime will generally suffer. Provided the limit be such as will give a full size suit, according to present notions and as existing canoes go, no hardship will be done to existing craft, and the future would be guarded against an abnormal growth of sails, spars and ballast. With a limit of sails, weight and size of hull and fittings will naturally be kept to moderate proportions.

Having carefully considered the question from all sides, I incline strongly to the following scheme as a simple, effective, racing limitation, and it will be proposed for adoption at the Royal C. C. autumn meeting, viz:

(*a*) Number of sails allowed to be set at a time, not more than two.

(*b*) Area of sails limited to:
First class—Mainsail, 100 sq. ft.; mizzen, or jib, 25 sq. ft.; spinnaker, 50 sq. ft.
Second class—Mainsail, 60 sq. ft.; mizzen, or jib, 15 sq. ft.; spinnaker, 30 sq. ft.

This sail limit can then be applied to either class (B or A), as suits circumstances. Thus for a "cruiser" race, the conditions would be "B class canoes, second class sails."

A first class limit at 80ft. main, 20ft. mizzen and 40ft. spinnaker would be better; but so many existing craft exceed this limit.

The photograph herewith shows Nautilus, of 1881, racing with a mainsail of 130ft. Such a sail with 14ft. boom and yard, is over the line of reasonable limit for a canoe. The new Nautilus of this season, winner of the R. C. C. challenge cup, has two sizes of rig: No. 1—Main 100ft., mizzen 15ft.; and No. 2, main 80ft., mizzen 10ft. She sails far best with No. 2 and moderate ballast; but there being no limit at present, she is bound to carry No. 1 suit in racing lest the wind fall off, when larger areas would have the advantage without doubt.

Were sail area limited, racing success would depend upon model handling and "set" of sails, rather than on size, weight and area

Intellect would be put into fair competition with brute force, and the purest form of amateur seamanship, canoe sailing, would be encouraged.

Wishing all success to the A. C. A., sincerely yours,

WARRINGTON BADEN-POWELL, Nautilus, R. C. C.

The Secretary was instructed to answer Mr. Baden-Powell, thanking him for his recommendations and also to invite him and other English canoeists to visit the meet next year; while the Executive Committee were requested to consider the question of limiting sail area, and also the selection, if possible, of such a date as would allow the English canoeists to be present.

On motion of Mr. Rushton, it was resolved to make both the FOREST AND STREAM and the *Canoeist* official organs of the Association.

The report of the Regatta Committee was next received and the flags were presented to the winners. Many of the flags were of very elaborate workmanship, embroidered and hand-painted, and did much credit to the artistic taste of the donors. After the presentation, Rev. Dr. Geo. L. Neide made a short speech, and an informal discussion of the place of next year's meet followed, after which the meeting adjourned, many leaving camp at noon.

No more dismal contrast can be imagined than that presented by a large camp just before and just after breaking up. In the morning a row of white and parti-colored tents, each with flags flying, reached from the hill down the shore, while the beach was bright with canoes. At noon a tent or two was still standing at intervals, a few canoes partly packed lay on the beach, and a huge pile of baggage and boats was on the wharf. At sunset the last tent had disappeared, and where the turtle of the Mohicans and the twin cherubs of Spring field had gamboled together but a few hours before, the lazy sheep found sweet nourishment on old hats and newspapers, and the patient kine placidly chewed the chromos from beef and tomato cans; while above on the crown of the hill, among the ashes of the camp-fire, a black silhouette against the western sun, stood "Uncle Mike," watching the last retreating paddle and wondering whether the canoeists would come back next year to Grindstone.

"CANOE AND CAMP COOKERY."*

THE practical camp cook book prepared by "Seneca" has just been published by the Forest and Stream Publishing Co. Its chief merits—distinguishing it from some other so-called camp cook books—are in its explicit directions, and the practicability of following them by campers whose experience may have been meagre and whose resources are necessarily limited. "The majority of books on out-door life," says "Seneca," "do not instruct in those rudimentary principles of cooking so important to the outer who has eaten all his life no food except that furnished him ready for instant despatch; and they commend to the camper dishes that require materials and utensils for their preparation which are seldom at hand in the field and forest. The object of this little volume is to give to the Corinthian cruiser and the camper some practical recipes for simple but substantial dishes, in such a manner that the veriest novice in the art of the kitchen may prepare palatable food with no more materials and paraphernalia than are consistent with light cruising and comfortable camping. The first part, "Canoe Cookery," instructs in such dishes as the limited outfit of the canoeist or camper who "packs" his dunnage afoot will admit of, while the second part, "Camp Cookery," deals with the more elaborate *menu* that can be prepared when ease of transportation will allow the carriage of a more extensive supply. Few of the recipes given are original with the compiler. Some have been obtained from trappers and hunters, others from army and navy cooks, and a few from cook books; but all have been practically tested in camp or on a cruise by the writer, whose pleasure in out-door cooking is only equalled by his delight in out-door life."

*CANOE AND CAMP COOKERY: A practical cook book for canoeists, Corinthian sailors and outers, by "Seneca." New York: Forest and Stream Publishing Co., 1885. Price $1.

CANOE RACES AT NEWARK.—Through a slight misunderstanding the regatta on the Passaic River, on July 15, did not occur under the auspices of the Ianthe C. C., but an impromptu race was arranged and took place about 4 P. M. The first event was a sailing race, open to all canoes. The entries were Mr. Geo. O. Totten, Jr., in the Daisy, and Mr. Wm. H. Hillier in the Essex. The race was one and a half miles to windward and return. The head wind and tide made it very difficult to round the buoy. The Daisy went round after a great deal of perseverance, but the Essex failed, and both canoes started home together. The prize was a handsome silk banner, and was of course awarded to the Daisy. Mr. Totten, it will be remembered by those at Newburg, was the winner of the paddling race at the meet. The next race was a paddling race for a silver medal, and was contested for by the following: Harry Van Ness, canoe Dido; Wm. H. Hillier, canoe E-sex; Geo. O. Totten, Jr., canoe Dolphin; Chas. Holt, canoe ———; C. H. Dey, canoe Pioneer; Geo. Cox, canoe Achilles. The Achilles took the lead almost at the first and maintained it through the race, and was an easy winner, Holt, in a nameless canoe, being second, and Dey, in the Pioneer, third. All concerned were well pleased with the result of the race.—WILLIAM H. HILLIER.

CHICAGO C. C. REGATTA.—The annual regatta of the Chicago C. C. will be held off the Tippy-Canoe Club House, foot of Thirty-ninth street, Saturday, Aug. 15, at 3 P. M. The races and prizes to be contested for are as follows: First—Class A, sailing, first prize a silver cup; second, silk flag. Class B, sailing, first prize a silver cup; second, silk flag. (Above two classes will start together). Second—Class 2, paddling, first prize, gold medal; second, silk flag. Third—Class 3 and 4, paddling, first prize, gold medal; second, silk flag. Fourth—Tandem paddling, first prize, gold medal; second, silk flag. (A "booby" prize of leather medals will be given in this race to the last crew in). Fifth—Upset race, canoes to be upset at signal, righted, and paddled to the finish; first prize, silver medal; second, sponge and bailer. The classification of canoes is as follows: Class A includes all canoes 28in. beam and under. Class B includes all canoes over 28in. beam. Class 2 includes all canoes 28in. beam and under. Classes 3 and 4 include all canoes over 28in. beam. Tandem and upset races free for all classes.

A ROUGH WATER RACE IN CANOES.—On July 24 a private match was sailed on New York Bay between the canoe Tramp, C. J. Stevens, and Guenn, W. Whitlock, the course being from the reef off the New York club house around Bedloe's Island, 7 miles. The start was at 12:10, in a lumpy sea with ebb tide and wind southeast, blowing so hard that two reefs were carried by both. Guenn led at the start and turned at 12:45 with Tramp at 12:48. Beating home a screw eye in the Tramp's deck drew out, letting the tack fly, so she withdrew, Guenn winning at 1:43, time 1h. 33m.

THE "CONSOLATION" PRIZE.—New York, Aug. 10.—*Editor Forest and Stream:* Can I use your columns to inquire as to the fate of the prize I offered at the late meet of the A. C. A.? The only communication I have ever received after offering the trophy was a telegram stating that when the Regatta Committee met, my offer would receive consideration. I tendered a prize of the value of $20, to be selected by the winner in a paddling race, the contestants to be those who had never won any race in the Association meets.—JOHN HENRY HULL, President Brooklyn C. C.

"CAMP GRINDSTONE."—The *Century* magazine for August contains a well written article on the canoe meet at Grindstone in 1884, written by Mr. Henry Eckford, who was present at the camp as a guest of the New York C. C. The illustrations, by Mr. W. J. Rogers, N. Y. C. C., are very good, many of the figures being easily recognized as likenesses. The article makes a valuable souvenir to all who have visited Grindstone, while to outsiders it gives a novel and faithful view of the canoeman in his favorite resort.

N. Y. C. C. REGATTA.—The annual fall regatta will be held off the club house on Sept. 19. The programme will be published shortly.

PERSONAL.—Mr. Wm. Whitlock sailed for England on July 24, and ex-Com. W. L. Alden, N. Y. C. C., sailed on Aug. 8 for Rome.

A COMMONSENSE VIEW.—The Genesta has gone to Newport to try her speed against the Eastern yachts before competing for the Queen's Cup, and the result of her first race in American waters will be eagerly awaited. As Americans we all want the Cup kept in this country, and with all respect for the Genesta and her gallant owner, we want to see her beaten. At the same time if she should be beaten by a sloop—and we have no cutter to match her—the result will undoubtedly be to revive the waning prestige of the sloop and the centerboard. This is as result greatly to be deprecated. Although on a given occasion a sloop may prove to be faster than a cutter, the fact will remain that the sloop rig is rather the worst in the world, and that the flat skimming dish centerboard model is not to be compared for seaworthiness or for weatherly qualities with the cutter. It is therefore possible that whatever may be the result of the Genesta's race for the Cup, it will not be without its pleasant features. If we keep the cup we shall be happy, and if we lose it we can say that the triumph of the cutter cause is some consolation for the loss of the Cup. In any event we are to have a fair, manly contest, and the Genesta, unlike the Cambria and the Livonia, will have no grounds for protesting against the alleged unfairness of New York yachtsmen, —*New York Times.*

FIXTURES.

Aug. 14—Quincy Y. C., Second Championship Race.
Aug. 15-30—Quaker City Y. C., Annual Cruise, Delaware and Chesapeake Bays.
Aug. 15—Hull Y. C., Open Race
Aug. 20—First of Trial Races, N. Y. Y. C. Course.
Aug. 20—Toledo Y. C., Third Club Regatta.
Aug. 24 and 25—Michigan Y. C., Regatta at Lake St. Clair.
Aug. 25—Michigan Y. C., Open Inter-Lake Regatta.
Aug. 25—Pentucket Y. C., Club Race.
Aug. 27—Greenwich Y. C., Annual Regrtta
Aug. 29—Quincy Y. C., Third Club Race.
Aug. 29—Beverly Y. C., Swampscott, Third Championship Regatta
Sept. 5—Hull Y. C., Champion Race.
Sept. 5—Larchmont Y. C., Fall Pennant Regatta.
Sept. 7, 9, 14—America Cup Races.
Sept. 9—Beverly Y. C., Nahant, Fall Regatta.
Sept. 12—Quincy Y. C., Third Championship Race.
Sept. 12—Boston Y. C., Fourth Club Race.
Sept. 19—Beverly Y. C., Nahant.
Sept. 19—Hull Y. C., Champion Race.
Sept. 19—Pentucket Y. C., Union Regatta.
Sept. 28—Pentucket Y. C., Championship Regatta.

NEW YORK Y. C. CRUISE.

THE day after the Goelet Cup races, Aug. 4, found all the fleet in harbor at Newport, some of them rather the worse for wear. Mohican had lost her maintopmast and masthead, as well as her jibboom, Dauntless had carried away her main gaff, and Bedouin was minus a bowsprit, besides many smaller disasters among the yachts. It was decided not to sail for New Bedford, as there was still a heavy sea outside. On Wednesday morning the wind was south, a wholesail breeze when the yachts started at noon from Brenton's Reef, where the Polynia lay at anchor to start them. From Brenton's Reef to New Bedford the courses are to the Hen and Chickens, 17 miles, east one-half south; thence to off the Dumpling Rock, northeast, 7½ miles; thence to off Clark's Point lighthouse, 4 miles, north by east for the finish—total distance about 30 miles.

With a south wind light sails were on all. It was expected that Genesta and Stranger would be in the race, but both crossed to leeward of the line, the former sailing easily with small topsail set and a boat in tow. The leaders got off well, Gracie leading and holding first place for half an hour, when Priscilla passed her. Over the whole distance the iron sloop held her place, coming in well ahead of all. Spinnakers were carried to starboard for a part of the run and then shifted to port, the entire race being before the wind. Puritan was delayed for some time near the start by her jibtopsail splitting, necessitating a change for a smaller one. The times of the yachts were:

	Start.	Finish.	Elapsed.
Gracie	12 02 33	3 17 58	3 15 05

The yachtsmen were warmly welcomed in New Bedford. It was decided to abandon the Sandy Hook race and to sail next day for Vineyard Haven. Next morning the wind was strong from N.E., with every appearance of a storm, and some of the yachts decided not to start. At 10:40 the signal was given from the Polynia, anchored off Clark's Point Light, and at 10:47 Puritan crossed. It was first a run and then a beat out, with a strong topsail breeze, and Puritan kept ahead and to windward until at 12:40 her throat halliards carried away, delaying her so long that Priscilla overtook her; but starting again on even terms the Boston sloop came in ahead, beaten only 2m. 44s. on elapsed time, notwithstanding her mishap.

The last race of the week was on Friday, from Vineyard Haven to Newport. Puritan again winning a decisive victory in light weather, leading all the way. An early start was made at 8:20 A.M., with a light northwest wind, dropping to a calm two hours later. A little after noon a light south wind came up, and by 1:30 it had freshened into a sailing breeze. Vineyard Sound lightship was passed by Puritan at 1:16:30 and Priscilla at 1:23:17. Many of the yachts left in the morning and others did not finish but continued west, the fleet being timed at Newport as follows:

SCHOONERS.

	Start.	Finish.	Elapsed.	Corrected.
Norseman	8 23 00	4 02 14	7 29 14	7 29 14
Fortuna	8 23 26	3 56 28	7 33 02	. . .

Clytie	8 25 01	4 28 28	8 03 27	. . .
Dreadnaught	8 31 08	not timed.		

SLOOPS.

Puritan	8 21 35	3 26 28	7 04 53	7 03 14
Priscilla	8 24 06	3 35 09	7 11 03	7 11 03
Isis	8 27 39	3 59 25	7 31 46	—
Gracie	8 32 45	not timed.		
Gaviota	8 26 44	not timed.		

A meeting was held on the flagship after which the fleet was disbanded. The following order was issued: "During the hour from noon till 1 o'clock on Saturday, Aug. 8, vessels of the N. Y. Y. C., now at anchor in Newport Harbor, will, out of respect to the memory of the late Gen. Grant, be placed in mourning and the flagship will fire minute guns during that time." Genesta went on to Marblehead and Boston, where she will be docked, Puritan and Priscilla are now in New York, the former at anchor off Stapleton and the latter at Poillon's, where her mast has been hoisted out and shortened.

QUEBEC Y. C.—A race was sailed by this club on July 29 for the cup presented by Com. Gregory and Vice-Com. Ritchie, over a course from the Custom House to Beaumont buoy and return, open to boats of 15 tons and under. At 1:55 P. M. the following yachts started: Foam, Mr. A. C. Scott; Favorite, Mr. Wm. McLimont, Jr.; Serieux, Mr. A. J. Auger; Montagnais, Mr. J. B. Morin; Iris, Mr. T. S. Hethrington; Osprey, Mr. J. S. Thom. The wind was light and off the island it dropped to a calm, leaving the fleet to drift to Beaumont Church where it freshened up. The times at the turn were: Osprey 4:04, Iris 4:05, Foam 4:05¾, Montagnais 4:06½, Serieux 4:08, Favorite 4:10. Osprey did still better going home, and Montagnais took next place, the order at the finish being: Osprey 5:27½, Montagnais 5:38, Iris 5:38¼. The judges: Messrs. Chas. Mackenzie, F. A. Falkenberg and E. G. Meredith, Starter, Mr. Chas. Mackenzie, Time keeper, Mr. John Shaw.

THE LAKE Y. R. A. ROUND.

SO many exciting events have lately taken place along the coast, and so much has happened to occupy the attention of yachtsmen at Newport and on the Sound, that we are apt to forget that all sailing is not confined to New York, Boston and Newport; that there are many good sailor men who do not smell brine from one year's end to another, and that far above the level of the Atlantic there are seas whose waters are always fresh, where it is always high tide, and whose varied shores and bays afford facilities for all forms of yachting. It is true that for large tonnage and a numerous fleet we must still look to the East; but beyond these, in the essentials of good waters, thorough love of yachting and a complete system of organization, at least one of the great lakes is in no way behind the seacoast.

A year ago last spring, the yachtsmen of Oswego, Toronto, Kingston and Belleville united in organizing the Lake Yacht Racing Association, and arranged a round of races under one set of rules (the length and sail area system of the Seawanhaka Corinthian Y. C.), which races were successfully sailed last August. This year a similar round was laid out, starting with a regatta at Toronto on July 30, then a sail to Niagara and a hop at night; a cruise to Oswego, racing there on Aug. 4, then over to Kingston for a race on Aug. 7; on to Belleville on the Bay Quinte, racing there on Aug. 12, and then home. This programme has already been partly carried out, though somewhat modified by the severe storm of last week, and it will be finished to-day or to-morrow.

The feeling in Lake Ontario in regard to deep-draft boats is divided, a large number of the yachtsmen believing in them, but as yet there are few cutters. First of all is the Watson ship Aileen, a fine looking cutter of 33 tons, built in Toronto in 1883; the Verve (No. 1) 10 tons, also by Watson, and the old iron cutter Rivet, built in Glasgow in 1856. Besides these are the Alarm, yawl, Condor and Cricket, keel sloops. The centerboards include Atalanta, Norah, Garfield, Ethel, Cygnet, Ella, Iolanthe, Katie Gray, Surprise, Laura of Kingston, Laura of Oswego, Fascination, and a number of smaller sloops besides the schooner Oriole. While the centerboards are more numerous, there is a growing feeling in favor of the cutter type, as the lake is deep and most of the ports have depth enough for a cutter of moderate draft. The centerboarders are mostly of Cuthbert's or McGiehan's models, shoal and wide, and not the best craft in the world for such open waters, but they are in competent hands, and an accident seldom occurs. Most of the yachts are manned and sailed by amateurs, and the united fleet boasts a number of skilful Corinthians. For two seasons the present rule has been tried, and it is found to work well and to rate very fairly the various types. On its adoption, in order to preserve nearly the same classes as before, the fleet was divided into three classes; yachts of 38ft. or over corrected length, yachts 25 to 38ft. and under 25ft.

The first race of the series was set for July 30 at Toronto, under the management of the Royal Canadian Y. C., and over their course, which is, to start between the judges' launch and the Exhibition Grounds, thence outside to the first and second harbor buoys, and between the bell buoy and the Island, thence five miles to a buoy moored off Victoria Park, thence in a southwesterly direction to a buoy moored five miles out, thence back to the bell buoy, and a second time around the triangle, after which the run was outside the harbor buoys to the Western Gap, and thence to finish opposite the Royal Canadian Y. C. house. In case of adverse wind or so light a wind that the yachts could not get into the bay, the finish was to be made across an imaginary line extending from Hanlan's Hotel to the wharf at the Exhibition Grounds. The second class yachts started and finished in front of the club house, making one round only.

The prizes offered were $150, $75 and $40 in first class; $100, $60 and $40 in second class; $50, $30 and $20 in third class. Besides these, $10, $5 and $3 were offered for open skiffs, and a flag for canoes. The arrangements were all in the hands of the officers of the club, the Commodore, Mr. John Leys; Vice-Commodore, George Goodertham; Rear-Commodore, R. Cochran; Hon. Secretary, Lieut-Col. Grascft; Assistant Secretary, O. L. Spencer, and the Sailing Committee—Capt. Stupart, chairman; H. T. Beck, J. E. Robertson, F. H. Duggan, Beverley Jones, C. E. Ryerson, E. W. Edwards. None of the yachts from Oswego or Kingston were able to join in the first race, Belleville and Toronto only being represented by the following boats:

First class—Atalanta, Messrs. Flint and Holton; Belleville Y. C., corrected length 38.8; Oriole, Vice-Com. Gooderham, R. C. Y. C., 63.64; Aileen, Com. Leys, R. C. Y. C., 57.06; Cygnet, Com. McGaw, T. Y. C., 48.43; Alarm, Capt. Robertson, R. C. Y. C.; Condor, Vice-Com. Cosgrove; Verve, Rear-Com. Cochran, R. C. Y. C., 39.8. Second class—Iolanthe, Mr. Biggar, R. C. Y. C.; Vera, Witch, Bonita, Wawa. Third class—Mischief, Meteor, Peerless, Skiffs—Eva, Comet.

A reception was held at the R. C. Y. C. house in the afternoon, the band of the Tenth Royals furnishing music for the dancing, while the guests were also able to witness the race. At 10:10 A. M. the signal for the second class was given, Iolanthe going over first at 10:10:30, the rest straggling slowly across in a very light breeze, their times being, Vera 10:20, Bonita 10:28, Witch 10:34 and Wawa 11:16. At 11:15, when the first signal for the larger boats was given, a light wind was blowing from S.W., and all the fleet had kites flying. At 11:20 the start was signaled and the fleet went over as follows: Condor 11:21:20, Cygnet 11:21:40, Verve 11:22:10, Oriole 11:23:30, Atalanta 11:25, Aileen 11:25:45. Cygnet laid up close for the harbor buoys, while the others stood off further, running down free. Verve soon being head boat, Cygnet, losing time in making a tack, was passed by Atalanta as well, the order being now: Verve 11:45, Atalanta 11:47, Cygnet 11:48, Oriole 11:48, Aileen 11:49, Condor 11:50. On the run to Scarboro buoy Atalanta picked up, passing Verve, while Oriole and Cygnet also changed places, the latter losing ground to leeward. The times were: Atalanta 12:16, Verve 12:20, Oriole 12:21:30, Cygnet 12:22:30, Aileen 12:24, Condor not timed. The next leg, to windward, gave the little cutter a chance to show her speed, and beautifully handled she walked away in a mere breath of a breeze, with Aileen hunting her, Atalanta losing her advantage. Cygnet and Oriole held close together, the former gaining a little on this stretch.

The times at the South buoy were: Verve 2:01, Aileen 2:10, Atalanta 2:13½, Cygnet 2:31, Oriole 2:32, Conder 2:59. The sun grew hotter and hotter, and the wind fell entirely for the next hour, the yachts drifting over the 5-mile leg under spinnakers and watersails. Verve more than held her own, while Aileen was still second, the times at the bell buoy being: Verve 3:37½, Atalanta 3:41, Aileen 3:42, Cygnet 4:00, Oriole 4:07, Condor not timed. To Victoria Park buoy the distance was another 5 miles, with a little more wind, Verve still leading, while Aileen left the big sloop. The times were: Verve 4:07½, Aileen 4:16½ Atalanta 4:20, Cygnet 4:35, Oriole 4:44½. For another hour under a broiling sun the yachts drifted along to the South buoy again, Verve going steadily away from Atalanta, while Aileen also increased her lead on the sloop, and Cygnet left the schooner. The times at South buoy were: Verve 5:09, Aileen 5:30, Atalanta 5:37, Cygnet 5:51, Oriole 6:11. With the ghost of a free wind in their spinnakers the fleet drifted into the western opening of Toronto Bay. Verve, Aileen and Atalanta finished, but Cygnet, owing to a misunderstanding of the sailing directions, took in her kites before crossing the line, thus losing some time which would have put her into third place. The times were: Verve 6:37:15, Aileen 6:51:04, Atalanta 6:54, Cygnet 7:09:18, Oriole and Condor not timed. The summary is as follows:

FIRST CLASS.

	Start.	Finish.	Elapsed.	Corrected.
Verve	11 22 10	6 37 15	7 15 05	6 44 42
Aileen	11 25 45	6 51 04	7 25 19	7 16 31
Atalanta	11 25 00	6 54 00	7 29 00	7 29 00
Cygnet	11 21 40	7 09 18	7 47 38	7 29 21
Oriole	11 23 30	. . .	. . .	. . .
Condor	11 21 20	. . .	. . .	. . .

SECOND CLASS.

Iolanthe	10 10 30	4 09 20	5 58 50	. . .
Vera	10 20 00	5 55 30	7 35 30	. . .
Wawa	10 16 00	. . .	. . .	. . .
Witch	10 34 30	. . .	. . .	. . .
Bonita	10 28 00	. . .	. . .	. . .

THIRD CLASS.

Mischief		. . .	8 27 00	. . .
Meteor		. . .	8 34 00	. . .
Peerless		. . .	8 37 00	. . .

Eva won the skiff race, with Comet second. No canoes entered.

While such a race is in no way a test of a yacht's merits it is at least instructive, as there was no fluking, but one and all had the same show; and with equal chances the two cutters, lugging heavy lead keels at a great depth, drifted away from the shoal draft boats, a pretty conclusive proof, if any were needed, of the fallacy of the idea that prevailed but a few years since on the subject of depth and resistance. While the yachts were well handled, the sailing of Verve was specially good and in marked contrast to that of a few days later, showing what the boat is capable of when properly sailed. Aileen also did well when compared by the light-weather standard of McGiehan's Cygnet and Cuthbert's Atalanta, beating one by 12mm 50sec. and the other by 12min. 29sec. Altogether the performance of the two cutters was a remarkable one, and has already set some of the ultra sloop men to thinking.

The fleet were to rendezvous at Niagara on Saturday, and all but Verve were in port by afternoon, Aileen, Rivet, Oriole, Atalanta, Alarm, Cygnet, Bonita and Condor. On Saturday night a hop was given in honor of the yachtsmen at the Queen's Royal Hotel. The programme was to start next morning for Oswego in good time for Tuesday's race, but at daybreak the storm that was so severe along the entire eastern coast was raging in Lake Ontario, with a heavy sea outside the harbor. At 9 A. M. Aileen got under way for Oswego and an hour later Verve followed her, the others glad to stay inside.

Once in the lake a very heavy sea was encountered with a head wind, and after beating for some time both made for harbor, Aileen running into Port Darlington and Verve into Port Hope. On Monday the weather was no better and it was decided to postpone the race to Wednesday. Atalanta started out of Niagara at 9:30 A. M. and at 12:30 was off Olcott. At 3 P. M. she was abreast of Thirty-mile Point, where the sea was so heavy that she ran back to Olcott, arriving at 6:25 P. M. Meanwhile the Oswego yachtsmen were eagerly looking out for the visitors, with some anxiety at their non-appearance as Tuesday passed.

The charge of the visitors was in the hands of Com. Mott, who telegraphed on Monday night and all day Tuesday to the various lake ports for news of the scattered fleet, with but meagre answers. The principal fear was for Iolanthe, the smallest of the yachts. A number of yachtsmen came by rail to Oswego, among them some from Belleville, and as no news could be had, there was some alarm felt for her safety. In the afternoon the Commodore, with a party of yachtsmen who had been carefully scanning the horizon all day from the club house, took a tug and went in search of the missing ones. The sea had gone down somewhat, but there was still a sharp, vicious roll to it which sent the gunwales of the stumpy, high-sided lake tug well under, and brought a suspicious paleness to more than one face. Steaming up the New York shore, a speck was at length seen in the west, which slowly grew until it was recognized as a sloop yacht. "Which one?" was the question for some time, the friends of each recognizing their own craft, but finally all agreed that it was the Iolanthe. Rapidly the boats neared, but they were quite close before it was decided that the arrival was not Iolanthe, but Cygnet. Soon the Toronto sloop was alongside, her skipper on the bows, ready with the hail, "Are the others in yet?" while at the stick, tastefully attired in oiler and sou'wester, was the secretary of the Association. Cygnet reported that she had only left Niagara that morning, and had sighted none of the others. By this time another yacht was plainly seen, and the tug ran on to meet her, Cygnet entering the harbor and anchoring at 4:15 P. M. The other, a larger craft, was soon recognized as Atalanta. She reported as leaving Olcott at 5:30 A. M., with a sea running but little wind, and passing Thirty-Mile Point at 6:35, Oak Orchard 7:38, Charlotte 11, Big Sodus 2:08, and at 3:10 passing Iolanthe. Still another sloop now appeared, and the tug ran off to her, soon making her out as the missing Belleville boat, and giving her a warm welcome. No other boats were sighted, and the tug returned to the club house, where the crews were still looking for the other yachts, and speculating on the chances of wind for the morrow.

Through the evening a careful watch was kept up, and Com. Mott had a tug ready to run out as soon as a yacht was sighted. About 10:30 P. M. a party of yachtsmen were gathered in the Ethel's cabin, when a voice from the deck announced the arrival of Aileen. A rush was made for the companion, boats were hauled alongside, and all were soon afloat, stopping for a minute to rescue one of the Cricket's crew, the commodore's spaniel Fritz, who in the excitement and darkness leaped overboard instead of into the boat. Before the chain had ceased to rattle a dozen were on deck with a hearty welcome for the late comers and anxious inquiries for missing yachts, Aileen had lain at Port Darlington from Sunday night until Tuesday morning, when she had started away. No sooner were greetings and news exchanged than the cry went up for K. and a song, in answer to which there stepped out of a dark corner of the cabin a tall and bronzed sailorman in a huge "Tam," a pair of baggy knickerbockers, and a jersey with the initials of the Royal Northern Y. C. Advancing to the center of the cabin he struck up the the classic "Redu" of the Mudhook Y. C., no less famous and popular now along Lake Ontario than it is among the lochs and bays of old Scotia, while all joined in the chorus until the glasses on the table rattled in time. After the musical part of the performance was completed the party broke up, with a final look to the westward for the still absent Verve.

At 6:30 the next morning a gun from the Cricket announced the arrival of the little cutter, who lay outside with no wind. The fleet was all complete with the exception of Oriole, as Alarm was not entered for the regatta.

It is only within a few years that yachting has been possible at Oswego for want of a suitable harbor, but now the government breakwater affords ample protection to the fleet. The Oswego Y. C. have a handsome club house just inside the coal trestle and not far from the center of the city. Adjoining the main club house is a large building for members' boats, the entire premises being very conveniently arranged. The club has a large membership and a growing fleet of yachts, including the steamers Ruth and Angler. Once outside the breakwater a yacht is in the open lake and here a fine course is laid out in still water with no tide and little current. It is a triangle with 3¼ mile sides, the first bearing W.N.W. from the start just opposite the club house. The second leg runs N.E. ¾ E. and the third S. ¾E. Three rounds or 30 miles were to be sailed by the first class in 7 hours and 2 rounds in 5 hours by the second class. The prizes offered were $150, $75 and $50 in first class, and $100, $50 and $25 in the second class, with no entrance fee from the losing boats, but 10 per cent. from the winners. The championship pennant of the club was also open to yachts of the Oswego Y. C., being the fourth race for it. The tug Camelia carried the guests of the club, while on the tug F. S. Wheeler were Messrs. Fitch, Sloan and Gordon of the Regatta Committee, the judges, Messrs. Clark Morrison and M. J. Cummings, and the referee Mr. P. W. Cullinan.

The entries were: Class 1, Atalanta, Aileen, Garfield, Verve, Cygnet and Ethel. Class 2, Iolanthe, Katie Gray, Cricket, Fascination, Fanny F., Laura, of Oswego, and Laura, of Kingston. There was no wind in the morning, and a thick haze hung over the lake. The yachts sailed or towed outside and lay there in the fog for some time. About 11 A. M. the fog lifted a little, and before noon it had disappeared. At 10:53:30 the first gun was fired, and at 10:58:30 the second, the first class starting at the latter signal. The wind was from the north, very light, and all kites were set as the fleet went over on starboard tack, Garfield at 11:00:20, Atalanta 11:01:38, Ethel 11:01:50, Aileen 11:04:05, Cygnet 11:04:40, Verve 11:05:50, the latter three being handicapped at 11:03:30. At 11:08 a third gun was fired for the second class to prepare, and at 11:15 a starting gun. Class 2 crossed with Katie Gray at 11:17:20 and Iolanthe 11:17:45, the others being handicapped at 11:18. It was a beat to first mark, Garfield leading off well, as there was almost a flat calm, with water smooth, except for a long swell. By 11:40 there was a light breeze from N.W. The fleet had broken tacks and were scattered in an irregular line a mile long.

At noon Atalanta was ahead and out in the lake, looking for the expected N. W. wind, while Garfield stood further in shore. Cygnet was second and Aileen third boat, the rear guard being widely scattered, Verve was doing badly, seeming to have no life in her movements and totally different from her form on Tuesday in light weather, in fact through the entire race she seemed to be held back by something. At 12:23:10 Atalanta turned the first mark and set a diminutive apology for a jibtopsail, and about the same time a sail was sighted in the N. W., which finally proved to be the Alarm, Aileen turned at 12:36:15 and Garfield at 12:39, the latter so close to the buoy that a boathook was used to push off with. At second mark the order was Atalanta 12:52, Aileen 1:07, Garfield, Cygnet, Ethel, Iolanthe, Katie Gray and Verve. Atalanta still led down the wind with spinnaker set, finishing the first round at 1:43:20, with Aileen 1:57:00, Garfield 1:57:40, Cygnet 2:03:00, Ethel 2:07:45, Laura (Kingston) 2:31:09, Iolanthe 2:37:35, Katie Gray 2:38:00, Verve 2:40:00, others not timed. The wind now was blowing light from N. W., but dropped at times until it was very doubtful whether the race would be made in time. At the end of second round the order was Atalanta, Aileen, Garfield, Cygnet, Ethel. At one time Ethel was well ahead of Cygnet but she had not proper kites for such light work.

At 4:18 P. M., when the five hours' limit of Class II. expired, there was no wind and Laura (Kingston) was some distance from the finish, coming in at 4:28:09 or 10min. 9sec. over the time, but it was decided to call it a race, as the necessity of being at Kingston and Belleville made another race at Oswego a difficult matter. Iolanthe came in at 4:38:45, taking second prize, and Katie Gray 4:55:25, winning third money. Laura of Oswego lost her topmast by a hook straightening out when she was near the second mark on last round, her masthead also going over the side. The last round was a mere drift with stray puffs over some parts of the course, and was very tiresome to yachtsmen and spectators. At 5:35 P. M. Atalanta crossed the line with Aileen a mile or two astern, after which a flat calm fell, so that Aileen only came in at 7:40:10, while Garfield held on until 11:30 P. M., when she crossed the line and took third money, all the others having given up long before. The times were:

	Start.	Finish.	Elapsed.	Corrected.
Atalanta	11 01 38	5 35 00	6 33 22	6 33 22
Aileen	11 04 05	7 09 10	8 05 40	7 58 24
Garfield	11 00 20	11 30 00	12 29 40	.... ..
SECOND CLASS.				
Laura	11 18 00	4 28 09	5 10 09	5 08 41
Iolanthe	11 17 45	4 38 45	5 21 00	5 21 00
Katie Gray	11 17 20	4 55 25	5 37 40	5 34 09

Ethel takes the Commodore's pennant as first Oswego boat over the twenty-mile course.

Both Alarm and Oriole were at anchor when the race really finished at dark and the harbor presented a fine appearance from the club house. Mr. Coudé's handsome steam yacht Ruth, which had been out during the day with a party of ladies, was anchored off the club house and brilliantly illuminated, her name being displayed in colored lights, while colored fires and fireworks were lighted on the other yachts. A band was stationed on the upper balcony, while the large boat room had been cleared of its contents and handsomely decorated with rugs, mirrors and hangings. Here a long table was placed and a supper served to the yachtsmen. The tired sailors had found time to prepare themselves and decolleté jerseys and woolen caps had given place to frock coats, club caps and high collars with muslin enough in them to fit out a schooner with kites. Before going to supper the Commodore presented the prizes to the representatives of the winning yachts. After supper came songs and speeches, with an impromptu promenade concert, the assembly breaking up at midnight. The Katie Gray towed out into the lake to look for wind for a cruise to the Thousand Islands, while the others prepared to start next morning for Kingston.

On Thursday the fleet lay at anchor in Oswego, the programme being to sail on Friday, but there being no wind an arrangement was made to tow over. While waiting for the tug in the afternoon an impromptu entertainment was held by the yachtsmen on the breakwater. A rifle match was the first in order, after which a fiddle was tuned up and Scotch reels, hornpipes and quadrilles indulged in. A tug of war was won by the crew of the Cygnet against a picked team from the fleet, and songs and dances whiled away the time until 10 P.M., when the tug Thompson started off with three big barges, and in a string astern Oriole, Atalanta, Aileen, Alarm Cygnet, Verve and Iolanthe. Commodore Mott steamed down the line on another tug, and was heartily cheered by the fleet. During their stay in Oswego his entire time was devoted to the entertainment of the visitors, and his hospitality will be remembered by all as one of the pleasantest features of the cruise. Arriving at Kingston on Saturday the fleet was received by Com. Fairclough and the Kingston Yacht Club, who had the steam yacht Marquis of Lorne ready to take the visitors to the Canoe Camp, where a pleasant afternoon was spent.

On Sunday there was plenty of wind, but Monday there was almost none. The starters were, in the first class: Verve, Toronto, C. C. Dalton; Aileen, Toronto, J. Leys; Oriole, Toronto, W. Gooderham; Atalanta, Belleville, D. R. Leavens; Winona, New York, W. K. Bloodgood; Garfield, Kingston, Dr. Curtis; Cygnet, Toronto, H. D. Evans. Second class: Iolanthe and Laura, of Kingston.

Atalanta led away with Cygnet second, Aileen third and Verve fourth, the latter soon being completely becalmed. At the next buoy Atalanta still led with Winona in second place and Aileen third.

The second round was also a drift with wind and calms alternately. The times at the finish were:

Atalanta	4 35 50	Cygnet	5 25 35
Winona	5 01 25	Garfield	5 28 40
Aileen	5 08 30	Verve	5 30 35

Verve is fourth on allowed time. Iolanthe beats Laura by 1:26 corrected. The Belleville regatta was to be sailed on Wednesday.

HULL Y. C. REGATTA.

THE first championship race of the year was sailed by the Hull Y. C., on Aug. 1, off the club house, the courses being:

First and second classes—Across the line between the judges' yacht and flag boat, leaving judges' yacht on starboard, through Hull Gut, leaving Hunt's Ledge and Point Allerton buoys on starboard, to Harding's bell boat, leaving it on port, to Marten's ledge buoy, leaving it on port, to Hunt's ledge buoy on port, to and across line to judges' yacht and flag boat. Distance, 11 miles.

Third class—Across line to judges' yacht and flag boat, leaving judges' yacht on port, around Black Bush buoy No. 1 (half a mile south of starting line), through the West gut, around Wreck buoy (off west end of Pettick's Island), leaving it on starboard, around Wilson's Rocks buoy, leaving it on starboard, through Hull Gut, to and across line between judges' yacht and a flag boat. Distance 6 miles.

Fourth, fifth and sixth classes—Across line between judges' yacht and flagboat, leaving judges' yacht on port, around Hull Y. C. barrel (off northwest end of Bunkin Island), leaving it on starboard, around Hull Y. C. barrel, off Harry's Rocks (near Prince's Head), leaving it on starboard, around flagboat at starting line, leaving it on starboard, around Hull Y. C. barrel (off northwest end of Bunkin Island), leaving it on starboard, around Hull Y. C. barrel (off Harry's Rocks, near Prince's Head), leaving it on starboard, to and across line between judges' yacht and flagboat. Distance, 6 miles.

The wind came from S.E., blowing heavily, and during the race a violent thunder storm broke over the fleet, the rain pouring down. At 3 P. M. the first gun was fired, and at 3:05 the starting gun for first class, the others starting at five-minute intervals. Hera and Siren carried topsails in spite of the weather, the latter leading all the way. The buoy at Martin's Ledge had drifted away, so none of the yachts could round it. Banneret and Daly had a very close race, the former winning finally.

FIRST CLASS—KEELS.

	Length.	Actual.	Corrected.
Hera, G. R. Howe	36.10	2 15 51	1 51 34

FIRST CLASS—CENTERBOARDS.

Siren, King & Clark	39.03	2 14 56	1 52 15

SECOND CLASS—KEELS.

Banneret, J. F. Brown	25.02	2 51 38	2 16 34
Lizzie F. Daly, William Daly, Jr.	26.11	3 00 00	2 26 05

SECOND CLASS—CENTERBOARDS.

Atalanta, I. R. Thomas	28.04	2 19 06	1 47 30
Rambler, J. Henry	27.00½	Did not return.	

THIRD CLASS—KEELS.

Thelga, A. P. Thayer	22.07	1 03 25	0 41 28
Kitty, E. H. Tarbell	23.09	2 04 01	0 43 55

THIRD CLASS—CENTERBOARDS.

Imogen, B. T. Wendell	18 10	1 19 17	0 55 09
Kismet, A. P. Thayer	18 11	1 20 32	0 56 29

SIXTH CLASS.

Elsie, C. F. Hardwick	16.10	1 18 17	0 51 56
Mirage, M. M. Clark	17.10	1 18 38	0 54 31

The race was for cash prizes and a leg for the championship. Prizes were awarded as follows: First class, keels, Hera, $20; first class, centerboards, Siren, $20; second class, keels, Banneret, $15; second class, centerboards, Atalanta, $15; third class, keels, Thelga, $12; third class, centerboards, Queen Mab, $12; fourth class, Joker, $20; fifth class, Em Ell Eye, $10; sixth class, Elsie, $10.

The open regatta of the club will be sailed on Saturday next, starting at 1 P. M. The race is open to yachts of any club in the N. E. Y. R. A., and will be sailed under the Association rules, the classes and prizes being as follows:

First Class—For centerboard and keel yachts measuring 31ft. and less than 40ft. sailing length, first $50, second $25, first $50, second $25.

Second Class—For centerboard and keel yachts measuring 24ft. and less than 31ft. sailing length, first $40, second $20, first $40, second $20.

Third Class—For centerboard and keel yachts measuring 21ft. and less than 24ft. sailing length, first $35, second $20, third $15, fourth $10, first $35, second $20, third $15, fourth $10.

Fourth Class—For yachts measuring 19ft. and less than 21ft. sailing length, first $30, second $20, third $15, fourth $10.

Fifth Class—For sailyachts measuring less than 19ft. sailing length, first $30, second $20, third $15, fourth $10, fifth $5.

The sailing regulations of the Association governing the race are as follows: The start for all classes will be from anchor. A preparatory whistle will be blown on the judges' steamer at 1 o'clock, as a signal for all yachts to form in line between flags bearing the number of their class. Thirty minutes later the whistle on the judges' steamer will be blown, and the club flag lowered as a signal for first and second classes to start. Ten minutes later the whistle will be blown again as a signal for all other classes to start. Yachts may carry one man to every five feet and fraction thereof sailing length. Yachts on their return will pass between the judges' steamer and flag boat. Waterline with one fifth of after overhang. Schooners will sail at seven-eighths of actual measurement. Shifting ballast shall not be allowed. All boats under 21ft., or the dividing line between two classes nearest thereto (either way), in sailing length, shall be restricted to working sails as follows: For sloops and cutters, jib, forestaysail and mainsail; for schooners, mainsail, foresail, forestaysail and jib; for cats, mainsail only. All boats of or over 21ft., or the dividing line between two classes (either way) in sailing length, may carry the following sails, but no others: For sloops and cutters, mainsail, forestaysail, jib, jibtopsail, topsail and spinaker. For schooners, mainsail, foresail, forestaysail, jib, flying jib, jibtopsail, maintopmast staysail, topsails and spinakers; for cats, mainsail, spinaker, jib and topsail; the Herreshoff table of allowances will be used. No sharpies or catamarans allowed to enter this regatta.

GALATEA.

WE learn from private sources that Galatea will not visit the United States this year, as she is not yet in proper racing shape. The *London Times* gives the following account of the race in which she was dismasted on July 13, in the Royal Ulster regatta:

Course from Bangor, three times round flagboats off Carrickfergus, Black Head and Groomsport. Three times round; distance 50 miles. Starters:

Yacht.	Rig.	Tons.	Owner.
Galatea	Cutter	91	Lieut. Henn.
Irex	Cutter	85	Mr. J. Jameson.
Marjorie	Cutter	98	Mr. J. Coats.
Marguerite	Cutter	60	Mr. F. Connor.
Tara	Cutter	40	Mr. F. Taylor.

The time allowances were as follows: Galatea allows Irex 1m. 24s., Marjorie 6m. 33s., Marguerite 9m. 24s., and Tara 19m. 8s.

All had single reef in mainsails, third jibs out and topmasts housed, and, except on Irex and Marjorie, foresails were reefed. Consequent on the shortening of the course the start was delayed until 11 o'clock, and at that time the weather was dull and cheerless, and the wind blowing half a gale from the southward. But, although Belfast Lough was feather white, the sea was not heavy. At the flash of the starting gun Marguerite, Tara, Irex and Marjorie were ranged beam and beam—in fact, they came to the line with bowsprit ends level, while Galatea was barely her length astern. It was a reach with sheets just checked up to Carrick. Irex soon drew to the fore, Marguerite, which had the weather end of the line at the start, winded Tara and Marjorie and took second place, while the Galatea, after hanging for a time under the lee of the "forty," passed on and got into a long match with Marjorie. They tore along at a tremendous pace, ripping the sea into lahes of foam and sending the drift away in clouds, while all had lee decks awash. They bore around the Carrick maroldk, Irex h ing a clear lead; then came Marguerite, Galatea, Marjorie and Tara. Sheets were trimmed for a wind abaft the beam, but as they sailed on for the North Briggs the wind veered westerly and they came dead before it. There was no change in positions, and when they went round the North Briggs flag there was seven minutes difference between first and last. The wind came in furious gushes as they crossed the lough for Groomsport mark, and in the full weight of a heavy black squall Galatea was once a mass of flying foam, and Marguerite was almost hidden in a cloud of drift. With a high head of speed on, Galatea passed Marguerite, and the order at the Groomsport mark was—Irex, Galatea, Marguerite, Marjorie and Tara. They had a dead beat to the home mark, and the first round finished thus:

Irex	12 32 00	Marjorie	12 38 00
Galatea	12 36 00	Tara	12 45 30
Marguerite	12 38 00		

Consequent on the draw in the wind to the westward, they had a beat up to Carrick, and the wind came in heavier bursts than on the first round. Irex going grandly to windward was leaving Galatea, while Marjorie was weathering out on the latter, and soon had Marguerite planted under the lee beam, and Tara was dropping fast astern. A heavy squall struck Galatea when she was about three-quarters of a mile from the Carrick mark, and without warning the mast went off short of the iron band of the mast, about four feet above the deck. The wreck went over the port side and fortunately clear of every one; but the other vessels, fearful that something might be wrong, made for her. Irex, which had responded and was before the wind, was the first to speak to the crippled ship, and then Marjorie, which had tacked for her directly the mishap occurred, went to see if she could render any assistance. However, the anchor was let go, and the wreck got in, and after a while Galatea was towed to Bangor. The wind was lighter as they ran along the northern margin of the bay, and booms were carried right off on the starboard side, which brought about a very heavy gybe. At the North Briggs mark boat, booms were brought over without mishap, and with flowing sheets they went across to Groomsport, and beat up to the home mark, the second round ending thus:

Irex	2 25 31	Marguerite	2 36 56
Marjorie	2 35 46	Tara	2 55 10

The strength of the wind was entirely broken when they beat up on the last round to Carrick, and sailing in grand form, Irex opened her lead, while the Marjorie again marched away from Marguerite. In the run down to the North Briggs the reef was shaken out of Marguerite's mainsail and all carried balloon foresails. Booms were gybed at the lee mark, and with the wind on starboard quarters, they ran across the lough to Groomsport. Marguerite, bent on passing Marjorie, set her spinnaker on the housed topmast, the sail having an "Irish reef" put in it, and before Marjorie got hers set, the "sixty" was through to leeward into second place. In a steady working topsail breeze, they ran from Gromsport home, and Irex arrived an easy winner of a grandly sailed race. The times of finish were:

Irex	4 28 55	Marjorie	4 51 03
Marguerite	4 48 47	Tara gave up.	

Since the accident a new mast has been stepped which is 2ft. shorter than the old, while her topmast is 3ft. shorter. The old mast was a poor stick and never was satisfactory. She will probably not race again in England this season. Although nothing is known of Lient. Henn's plans yet it is highly probable that in the event of the Cup staying here we may hear from him again next season, or if it goes abroad he may have a chance to defend it there next year against an American sloop.

A PREMATURE EXPLOSION.

Editor Forest and Stream:

Is it not in order that we should hear from friend Kunhardt on the virtues of English cutters and models after the terrible collapse of American models at the Goelet cup race? The boys this way were very much disappointed that the imported Englishman (the Genesta) did not go in and get her jacket warmed by the Boston white beauty, Puritan by name. She has come to the top and now is the time for Boston boys to crow. We are going to do it this time, and you will find our rooster on top of Bunker Hill monument. After the terrible collapse of Mr. Kunhardt's pet theory, the Bedouin, we ought to holler hurrah for Boston and the Puritan! Why, the 3d inst. race was only a warming trial for our trotter. Wait until she gets alongside the Genesta, then she will let out and show a little speed. I must give vent to my feelings or I shall bust, I have got on too much steam over this grand occasion. What the Puritan has done can be done again, and more of it, by the same sort, and after two or three thrashings, as she gave the schooners, perhaps people will understand that it does not take two sticks and a lot of bamper to make a sea-going vessel. KEDGE.

CLINTON, Mass., Aug. 4, 1885.

[We agree with "Kedge" that he has on entirely too much steam, but would advise him to relieve the pressure more quietly, in case his hopes may not be realized. The "collapse" of Bedouin over which he crows so loudly was only the breaking of a bowsprit in a rough water race, and to argue from it that Puritan is more than a match for Genesta is going ahead too fast. Let Mr. Kedge haul his fires a little and wait until the races are over before putting up the rooster.]

LYNN Y. C. REGATTA.—A regatta was sailed on August 1 by the yachts of the Lynn Y. C. over the following course. Second class—From off club house around Point of Pines and Western Lobster Rock buoys, leaving them on port, to judges' boat and repeat; distance, 10 miles. Third class—From off club house around Point of Pines and Western Lobster Rock buoys, leaving them on port, to judges' boat; distance, 5 miles. The wind was fresh from the east when the second class started at 2:23 P. M., the third getting away at 2:36. Zita lost her topmast and Viola won in second class. Vesper led in third class over the course.

SECOND CLASS.

	Length.	Actual.	Corrected.
Viola, E. C. Smith	20 03	1 36 03	0 58 31
Jennie L., L. H. Lockhart	23.08	1 34 55	1 01 20
Zita, L. Cote	21.10	1 40 08	1 04 16
THIRD CLASS.			
Vesper, R. M. Benner	18.10	0 50 52	0 30 46
Georgie, W. B. and F. E. Newhall	18.06	0 54 22	1 33 59
Crest, W. Gordon	18.06	0 54 32	0 34 09
Spray, G. Putnam	14.08	0 59 55	0 35 36
Nymph, W. A. Estes	18.06	1 00 40	0 40 17

The prizes were taken as follows: Second class—First prize, $10, Viola; second, $7, Jennie L. Third class—First prize, $10, Vesper; second, $7, Georgie; third, $5, Crest. The judges were W. Haines, N. T. Davidson and J. W. Attwill. Regatta committee, W. B. Newhall. C. H. Lockhart, W. M. Rand, H. P. Armstead and W. Hawkes.

FROM BOULOGNE TO DOVER.—Considerable sensation was caused in the Old Dock, Leith, on June 29, on the arrival of the yacht Hati (one ton) from Boulogne, the owner and sole occupant being one of the officers of the Royal Scots (Lothian) regiment. The deck of the little craft is flush with the sides, and consequently throws off any water that may be shipped on board; while the sliding hatchway over the diminutive cabin is shaped like the back of a duck for a similar purpose. The dinghy or small boat used by the yachtsman is constructed of canvas, with a few small spars, and folds up into a sort of carpet bag when not required. The yachtsman crossed the channel from Boulogne to Dover, and made several calls along the coast on his way to Leith.—*Toronto Mail.*

ANNISQUAM REGATTA.—The postponed race was sailed on July 20 on Ipswich Bay, over the following course: From starting line to and between Squam buoys, thence around stakeboat near Essex outer black buoy; thence to stakeboat one mile, off Plum Cove buoy; thence between Squam buoys to stakeboat off Plum Cove buoy; thence between Squam buoys to finish line between judges' boat and flag boat. Leave stakeboats on starboard. A good breeze was blowing at 12:35, when the following yachts started in the second class: Crusader, Carrie May, Petrel, Ripple, Planchette, Vesper, Spray, Jalma, Spark, Lovette, Kittiwake, Thrasher, Flora Lee, Riverside, Hestia and Sassacus. The first class was started at 12:50: Muriel, Black Cloud, J. S. Payen, Jr., Frank Leslie, Evelyn, Awilda, Venus, Expert, Jet, Fatinitza and Kulunda. Flora Lee took the lead in second class and Black Cloud in first class, with Muriel second. Kulunda grounded but got off. J. S. Payen, Jr., passed Black Cloud and led her, but could not save her time. Expert put her bowsprit through Petrel's mainsail at the finish, and Thrasher was disqualified for going outside of Plum Cove buoys.

FIRST CLASS.

	Actual.	Corrected.
Black Cloud, Brown	2 20 17	1 39 29
J. S. Payen, Jr., Pierce and Payne	2 19 38	1 39 52
Muriel, Taylor and Armstead	2 25 28	1 43 52
Awilda, Farrall	2 29 05	1 50 17
Expert, Whitcomb	2 23 32	1 52 58
Venus, McKenzie	2 35 25	1 55 49
Kulunda, Marsh	2 31 12	1 57 24
Nora, ———	2 45 20	1 59 32

SECOND CLASS.

Flora Lee, Lincoln	2 27 45	1 36 09
Lovette, Haskins	2 34 10	1 48 43
Hestia, Dennen	2 43 00	1 54 00
Crusader, Wilson	2 44 35	1 56 59
Sassacus, Griffin	2 50 00	1 57 48
Ripple, Norwood	2 50 30	1 58 06
Spark, Gaffney	2 49 10	1 58 46
Petrel, Paul	2 48 20	2 00 56
Spray, Faxon	2 49 35	2 01 35
Planchette, Closson	2 48 05	2 05 29
Kittiwake, Cunningham	2 54 00	2 10 00
Fatinitza, Norwood	2 56 43	2 11 31

Black Cloud took first prize, a silver tea set valued at $75; the Payen, Jr., second, cordial set; Muriel, marine clock; Awilda, a cuspidore. In the second class the Flora Lee, first, a silver ice pitcher; Lovette, marine glass; Hestia, smoking set; Crusader, coffee pot.

There was also a dory race, George Smallet, of Bay View, taking first prize of $6, and Henry Davis, of Annisquam, second, $4.

Yacht Atlanta, which came in first at the last race, arrived too late to enter. There is talk of a race between her and the Black Cloud for a purse of $100.

HUDSON RIVER Y. C.—The annual regatta of this club was sailed on Aug. 3 in a strong N.E. wind with rain, only 12 out of 28 entries starting. The course was from an imaginary line between a stakeboat and the club house to a stakeboat off Pleasant Valley, thence to a stakeboat off Weehawken and back to the club house stakeboat, the course to be sailed over twice, except Class E, the small boats, which sailed over it once only. At 12:50 P. M. they went off in the following order: Frank Oliver, P. J. Tomlin, Nellie B., Willie, Lottie, Frankie, Clara S., Lone Star, Ada, Amelia, Prospect, Edith. Four of the yachts capsized, but no one was drowned. The times were:

	Start.	Finish.	Elapsed.	Corrected.
CLASS A—CABIN BOATS.				
Lottie	12 55 25	3 31 35	2 36 10	2 36 10
CLASS B—BOATS OVER 23FT.				
P. J. Tomlin	12 54 50	3 06 20	2 11 30	2 11 30
Clara S.		Not timed.		
CLASS C—BOATS FROM 23 TO 30FT.				
Prospect	12 59 05	3 47 30	2 48 25	2 48 25
Amelia	12 57 45	3 48 20	2 50 35	2 48 45
CLASS D—BOATS FROM 18 TO 20FT.				
Willie	12 55 20	3 24 05	2 28 45	2 28 45
Lone Star		Not timed.		
CLASS E—BOATS UNDER 20FT.				
Nellie B.	12 55 10	2 38 00	1 42 50	1 40 35

The winners in each class were Lottie, P. J. Tomlin, Prospect, Willie and Nellie B.

THE GREENWICH Y. C. REGATTA.—The first annual regatta of the Greenwich Y. C. will be sailed on Thursday, Aug. 28. The sailing races will be open to members of the Larchmont, New Haven, Beverly, Hull, Pelham, Seawanhaka Corinthian, Eastern, New York, Atlantic, and Oyster Bay Corinthian Yacht Clubs: Class I.—Cabin sloop, cutter, or yawl yachts of sailing measurements of 42ft. and under 55ft. Class II.—Thirty feet and under 42ft. Class III.—Twenty-five feet and under 30ft. Class IV.—Less than 25ft. Class V.—Open jib and mainsail yachts of sailing measurements of 23ft. or over. Class VI.—Less than 23ft. Class VII.—Open mainsail yachts of 23ft. or over. Class VIII.—Eighteen feet and under 23ft. Class IX.—Open mainsail yachts of sailing measurement less than 18ft. Entries will be received for an oyster boat race, the course to be from club house to Execution Lighthouse and back. First prize, $50 and champion pennant; second prize, $25. The following rowing races will also take place: Double skull, for professionals, prize $20; for amateurs, prize $15; for boys, prize $10, and for ladies and gentlemen, prize $15; single sculls for professionals, prize $15; for amateurs, prize $10, and for boys, prize $5; canoe race, prize $10; men's swimming race for championship of the Sound, prize $10; boy's swimming race for championship of Greenwich, prize $5; tub race; plank and shovel races and a duck hunt. In the evening there will be an illuminated procession of boats, and a prize of $15 will be awarded to the one best illuminated. All yachts in the harbor will also be illuminated. The sport will conclude with a display of fireworks.

HULL Y. C. LADIES' DAY.—In spite of clouds and rain, a large party of ladies and gentlemen were assembled at the Hull Y. C. house, on July 25, the club's ladies' day. After a time the rain ceased and the following yachts started out, each carrying a number of guests: Silvie, Commodore Charles V. Whitten; sloop Hera, Rear-Commodore George R. Howe; sloop Rambler, Captain J. J. Hearn; schooner Alice, Captain W. L. Lockhart; schooner Dorothy B, Captain Edmond Quincy; schooner Vanitas, Captain A. S. Wattles; sloop Magic, Captain E. C. Neale; sloop Nimbus, Captain Bernard Jenny, Jr.; cutter Thelga, Captain A. P. Thayer; sloop Echo, Captain Benjamin Putnam; cat Queen Mab, Captain W. H. Litchfield; cat Thistle, Captain J. R. Hooper; cat Myrtle, Captain Robert C. Poor; steam yacht Anna S, Captain Fred Pope; steam yacht Athlete, Captain J. J. Richards, by William H. Clark. The fleet sailed as far as Boston Light, and returned about 7 P. M. for a supper and dance. In loading a gun on the Silvie one of the crew was seriously wounded, and was sent to the hospital. The committee in charge included E. H. Ingalls, Colonel C. F. Harrington, Peleg Aborn, John R. Chadwick and E. L. Buswell.

CORINTHIAN Y. C., MARBLEHEAD.—The first championship race of the Corinthian Y. C. was held at Marblehead, Saturday Aug. 1. The wind was southeast, strong at the start but moderated some at the finish. The Addie, by the kindness of Mr. Abbott, the owner, was used by the judges. The first class boats, Witch, Expert and Eugenia crossed the line at 2:35 P. M., and five minutes later the second class boats, Unique, Psyche, Caprice, Dash, Mona, Vera and Tulip crossed in the order named. Eugenia soon took the lead in the first class which she held to the finish. Witch and Expert had a very close race, the former eventually crossing a short distance ahead. In the second class Tulip was handicapped, being late in crossing the line, and withdrew before the finish. Unique, Dash and Psyche stood further to the eastward than Vera, Mona and Caprice and gained thereby, although not enough to effect the result.

FIRST CLASS—KEELS AND CENTERBOARDS.

	Length.	Elapsed.	Corrected.
Eugenia, c. b., I. S. Palmer	25.06	2 04 20	1 31 08
Witch, k., B. B. Crowinshield	22.10	2 08 22	1 33 47
Expert, c. b., L. Whitcomb	23.03	2 08 56	1 34 51
SECOND CLASS—CENTERBOARDS.			
Dash, cat, A. S. Browne	20 01	1 26 39	1 05 06
Psyche, cat, H. M. Sears	17.06	1 31 01	1 11 48
Tulip, cat, Gordon Dexter	16.07	Withdrew.	
SECOND CLASS—KEELS.			
Unique, cat, G. A. Stewart	19.10	1 29 30	1 08 18
Vera, cutter, Everett Paine	19.09	1 33 42	1 17 25
Mona, cutter, Herman Parker	18.10	1 44 27	1 22 20
Caprice, sloop, J. B. Rhodes	17.10	1 48 50	1 25 58

Dash, Psyche, Eugenia, Tulip and Unique are cat rigged. Witch, Vera and Mona cutters, and Expert and Caprice sloop.—EVERETT PAINE, Secretary.

BURLINGTON BAY RACES.—The first race of this series, sailed on July 25, was won by Whistlewing, with Thetis a close second. The series includes seven races, to be sailed under the following conditions: The yacht making the best average to be awarded first prize, and the yacht making the next best average to get second prize. No yacht's average to be taken unless starting five times. In the event of a tie for first or second place those yachts tieing alone to sail off one race. Entrance fee, $5, to be paid to the secretary-treasurer before July 24, 1885. No boat will be allowed to start until entrance fee is paid. Prize, $50 to first yacht, second yacht to take all moneys on hand after paying first prize and expenses. Rules.—Royal Canadian Yacht Club rules, subject to following conditions: Start 2:30 P.M. sharp. Boats to cross an imaginary line between the Emigrant wharf and a buoy moored due north thereof, thence round No. 1 buoy to the piers, and out into lake, rounding a buoy moored four (4) miles due east of piers, thence back, crossing an imaginary line between the little lighthouse and a buoy moored due south of it. No restriction as to how yachts get through piers provided no steam is used. All buoys must be passed to starboard. No allowance made for boats starting after 2:30 P.M. First yacht to finish before sundown or no race. All disputes to be decided by a committee selected from among the subscribers. Boats to be measured before race by Mr. H. L. Bastien.

SOUTH BOSTON Y. C. REGATTA.—The third of the championship regattas of the South Boston Y. C., postponed from July 18, was sailed on Aug. 1. In consequence of the storm some of the yachts gave up, the times of those that finished being as follows:

	Actual.	Corrected.
SPECIAL CLASS.		
Nimbus, Bernard Jenney	1 10 05	0 53 29
Violet, Henry J. McKee	1 10 43	0 54 07
FIRST CLASS—KEELS.		
Dorcas L., W. H. Lyman	1 20 25	1 00 19
Altaire, A. J. McLeod	1 29 40	1 09 40
Stiletto, Wm. C. Cherrington	1 33 10	1 11 49
FIRST CLASS—CENTERBOARDS.		
Thisbie, S. A. Freeman	1 23 20	0 57 44
Awilda, John Farrell	1 20 15	0 57 36
SECOND CLASS—KEELS.		
Nydia, James Galvin	0 54 55	0 35 41
Diana, H. Burgess	0 50 00	0 39 29
Monarch, John J. Bligh	1 02 45	0 41 52

The judges were: Con McKenna, Thos. Christian, James Donovan, T. J. McDonough.

BUNKER HILL Y. C.—The seventeenth annual regatta of the Bunker Hill Y. C. was sailed on July 25, resulting as follows:

	Length.	Corrected.
FIRST CLASS.		
Lillian, Mr. Gilbert	30.00	4 47 36
Edith, Mr. Hodgkinson	28.06	4 40 22
Meta, Wilcox & Rich	29.04	4 26 02
Celeste, George E. Thomas	28.00	4 51 26
Eva, Mr. Porter	24.06	4 57 26
SECOND CLASS.		
Em Ell Eye, P. M. Bond	19.04	2 16 45
Kit, J. T. Higgins	18.08	2 33 33
Curlew, D. L. Day	19.00	2 39 10
THIRD CLASS.		
Sprite, Mr. Hinchey	18.00	1 09 00
Florence, Mr. Broman	17.00	1 11 08
Flash, Mr. Winters	17.04	1 12 46

The judges were George B. Thomas, Randall Gould and T. F. Jenkins.

HULL Y. C. CRUISE.—The fourth annual club cruise, which started on July 11, was hardly a success in point of numbers, as of the 13 yachts which started only the flagship arrived at Boothbay. On July 11, at 10:30, the Commodore reviewed the fleet from the Silvie, the following yachts passing in line: Sloop Hera, sloop Viking, Dr. L. D. Shepard; sloop Cricket, C. F. Adams, 3d; schooner Dorothy Q., Edmund Quincy; yawl White Cap, D. Hall Rice; schooner Vanitas, A. S. Wattles; sloop Optic, G. S. Hutchinson; schooner Tempest, H. F. Whittier, and steamers Annie S., Fred Pope, and Barracuda, B. Frank Dutton. Sailing for Marblehead in a light wind, White Cap was first to pass the rock. Only five yachts reached Gloucester that night, and at Portland on Tuesday only Silvie, Cricket and Viking were on hand. The three continued to the eastward, anchoring at night at Harpswell, where the schooner Aida, flagship of the Jeffries Y. C., joined them. Stopping at Herring Gut, they reached Rockland on Thursday night, where the Tempest was at anchor. From here the Silvie continued alone to Bar Harbor, arriving at 5 P. M. on Friday. Spending Saturday night at North Haven and Sunday at Boothbay, Silvie continued the cruise home alone.

A CRUISE ON LAKE ERIE.—The schooner Alarm, of the Buffalo Y. C. left at 3 o'clock on July 26, for her annual cruise up Lake Erie. She will touch at Port Colborne, Port Maitland, Port Dover, Long Point, Erie and possibly Cleveland. The following gentlemen are on board: Commodore J. S. Provoost, Capt. Harry D. Williams, J. E. Bergtold, Andrew E. Latz and George Robinson.

JURY OR CRUISING RIGS.—*Editor Forest and Stream:* In your issue of July 16 a correspondent, signing himself "B.," takes exception to the Genesta crossing under a jury rig. Without going into the question of the character of this so-called jury rig and asking whether it ought not rather to be called a cruising rig, as distinct from her racing fit out, I would merely remind "B." that the America herself crossed over (and that on an easterly passage, a very different affair from going west, as a general rule) under what he would be pleased to term a jury rig, and shipped her big spars in a French port. Comment is needless.—HENRY E. BAYLY (Exmouth, July 29).

CLARA IN PORT.—After a passage of 39 days from England, the 20-ton cutter Clara arrived at New York on Sunday night, and ran up the North River, anchoring off pier 16, the skipper not knowing the harbor. She was built by Fife, of Fairlie, and is 9ft. wide and nearly 54ft. on waterline, with 20 tons outside. Clara is the first yacht of her size and extreme type to cross the Atlantic, and though her passage was a long one, she carried her racing spars. She is now lying off Tompkinsville, and her crew are fitting her in racing shape.

A TRAP CAPSIZED.—In the afternoon of Aug. 3, while it was blowing heavily from the east, the open boat Three Brothers, of Communipaw, capsized off the New Jersey shore, fifteen men and boys being thrown into the water. All were rescued by an oyster boat. The same afternoon a sailboat, with two boys and two girls aboard, was capsized off Bedloe's Island, all being rescued by Officer Ganley. The boat was lost.

CARMELITA.—The voyage of this yacht to San Francisco has been stopped by a very sad accident. Last month, as the wife of her owner, Mr. J. V. Coleman, was unpacking a valise, a revolver fell out and exploded, the ball killing her instantly. In consequence of this calamity Mr. Coleman has ordered the yacht to return to New York for sale, while he will travel for some time in Europe.

HUDSON Y. C. REGATTA.—The fall regatta of the Hudson Y. C. takes place upon Sept. 15. The start and finish will be made off Oak Point, and the course will be to and around Sands Point, a distance of twenty miles. The regatta committee consists of Messrs. H. B. McAlister, J. W. Graff and R. F. Baxter.

LYNN Y. C. CHAMPIONSHIP MATCHES.—The Lynn Y. C. will sail three regattas on Aug. 14, 29, and Sept. 12, open to second and third class yachts, the boat winning two out three to take the championship.

THE DATES FOR THE TRIAL AND CUP RACES.—The dates selected for the races with Genesta are Sept. 7, 9 and 14. The tria races will begin on Aug. 20. The course for each day has not yetl been announced.

CORONET.—Next Monday Poillon Bros. will launch from their yard at Brooklyn the new schooner building for Mr. R. F. Bush. She will be named Coronet.

A NEW SLOOP.—Messrs. Piepgrass & Pine have laid the keel of a new sloop 40ft. ×12ft. 6in., for Mr. Thos. Kelis, of Williamsburgh.

YONKERS Y. C.—The Yonkers Y. C. will start on their annual cruise on Aug. 24, to continue for one week.

BRUNHILDE.—Mr. J. J. Phelps' schooner Brunhilde has arrived at Cowes after a passage of 26 days.

Answers to Correspondents.

☞ **No Notice Taken of Anonymous Correspondents.**

KANUCK—A letter for you at this office.

C. & H.—See Game Bag and Gun columns.

J. W. T.—It is used with satisfaction, and while we do not vouch for it, it is probably all right.

C. H. S.—The trigger pull is ascertained by force measured in pounds. To determine it use a spring scale.

M. L. A.—For open seasons see shotgun columns. Try the vicinity of Meacham Lake. Write to A. R. Fuller at that address.

W. H. G., Baltimore.—What is the best bait for German carp? Ans. Boiled peas, worms, and a paste made of flour worked into wet cotton.

E. F. P., New York.—Where can I obtain the best bass fishing? Ans. St. Clair Flats; Kelley's Island, Lake Erie; the St. Lawrence River from Alexandria Bay up to Cape Vincent; Rice Lake, Ontario, and Pelee Island, Lake Erie.

N. W. A. St. Albans, Vt.—Does Norris, in his "American Angler's Book," give descriptions of the standard salmon, bass and trout flies? Ans. He gives descriptions of flies for salmon and trout, but when he wrote the black bass had not risen to its present importance as a game fish, and few or none fished for it with the fly.

T. W., Leesburg, Va.—In "Nature's Serial Story," by E. P. Roe, one of the characters says a gray eagle is a young bald eagle, and that we have only two specimens of genuine eagles in this country, the bald and the golden or ring-tailed. Is this correct? Ans. Yes. The two eagles are the golden or ring-tailed (*Aquila chrysaetus*) and the white-headed or bald (*Haliœtus leucocephalus*). The bald-headed eagle is black-plumaged the first year, gray the second, and attains the whiteness of head and tail only in the third year.

THE TROY FOX-HUNTING ARENA has proved a dead failure. The "American Gentleman" who got up the scheme made a great mistake about the public appreciation of the sport of chasing boxed foxes in an inclosure. If they are still ambitious to provide a gory spectacle for the people, let them find some larger game. A circus company in New Hampshire the other day found it no trouble to collect a crowd of two thousand people to witness the shooting of an elephant. Mr. Bergh is perfectly right when he claims that the bull fight would prove popular in this country.

ANGLING is becoming quite the correct thing for public officials of high degree, whose vacations are given up to the sport. Readers of the late George Dawson's "Angling Talks," which were published in this journal, will not fail to understand the charm that a trout or salmon stream has for the weary man of office.

"THE FAIRY" MINNOW.

IMBRIE'S FAIRY 7.

This is by far the best artificial minnow ever made. It is a great improvement on the "Phantom," which has long been considered the best of all minnows. When put into the water it almost immediately becomes as soft as velvet and as tough as leather, besides having the exact appearance of a real minnow, even in the matter of scales. Our Phantom has been imitated, and so, no doubt, will this be. Anglers will find our name on every box containing one of these minnows, and our well-known trade mark on the card to which each minnow is attached.

The above minnow is No. 7. The following are the various sizes we keep in stock.

Nos.	4	5	6	7	8	9
Inches Long	2	2½	3	3½	4	4½

If your dealer does not keep our goods in stock, or will not order them for you, send us 50 cents for 120-page illustrated catalogue.

MONMOUTH, ILL.

ALLEN'S DUCK CALL—Improved, Nickel Plated; the most natural-toned, easiest-blowing, smallest and only Metal Duck Call ever invented and the only one that perfectly imitates the *wild* duck. Sent by mail on receipt of $1.

ALLEN'S BOW-FACING OARS—Can be attached to any boat in five minutes, shipped instantly in the roughest water; work much easier than the common oar. In duck shooting they are invaluable; you see the bird the instant it leaves the water. Sent by express on receipt of $8.

ALLEN'S SHELL SWAGE—Will reduce brass shells to their original size in one-half minute, making them as smooth and solid as when new. On ordering mention gauge wanted. Sent by express for $1; by mail $1.30.

ALLEN'S DECOY DUCK FRAME—Is a simple device for holding the dead duck in a natural position in the water. Price $4 per doz. **SEND FOR CATALOGUE FREE.**

CANOE HANDLING.

By C. B. VAUX ("DOT").

A complete manual for the management of a canoe. The author begins at the very beginning, describes and explains the rudiments in the simplest and plainest way possible. Everything is made intelligible for beginners; and besides this A B C teaching there are so many hints and wrinkles that the oldest canoeist afloat will find pleasure and profit in the study of these. The book is complete and concise—no useless duffle between its covers. The subjects treated are the choice of a canoe, paddling, sailing, care of the canoe, recipes and rules. The text is further elucidated by numerous practical drawings, and the beauty of the book is enhanced by the many ornamental vignettes. Pages 168; uniform with "Canoe Building." Price, postpaid, $1.00.

NEW YORK: FOREST AND STREAM PUBLISHING CO., 39 Park Row.
LONDON: DAVIES & CO., 1 Finch Lane, Cornhill.
NORRIE & WILSON, 156 Minories, E. C.

PREJUDICE IS A THIEF,

And will rob you of many good things.

Our cigarettes are as fine as can be produced. They have lately been improved, are not hard nor dry. Will always smoke free and moist. Will not crumble in the pocket nor "catch you in the throat." If you are not opposed to a change and cannot obtain them of your dealer, send to the manufacturers for a sample.

Enclose Three Red Stamps. **WM. S. KIMBALL & CO., Rochester, N. Y.**

"FOREST AND STREAM SERIES."

DEER HUNTING.

BY JUDGE JOHN DEAN CATON.

BY and by it will be time to hunt antelope and deer. It is always time to read about them. Judge Caton's book on the antelope, elk, deer, moose and caribou of America discusses in a readable way the life history of these animals and the methods of their capture. It is the work of an enthusiastic sportsman who has had a wide experience and has devoted the leisure of years to studying these interesting game animals. The volume is very fully illustrated; and is a perfect storehouse of information and entertainment. The first edition was sold by the Boston publishers at $4. Price $2.50.

WOODCRAFT.

BY "NESSMUK."

A COMPACT pocket handbook of condensed, boiled-down, concise, clear, comprehensive, sensible, practical camp gumption. "Nessmuk" has been "in the woods" in Michigan, New York, Pennsylvania, and South America, and this is a book for outers, wherever they kindle their camp-fire. The author believes in "smoothing it." He has learned how; now he tells others. It is much easier to learn from "Nessmuk" than from Dame Experience. We should not be surprised if "Woodcraft" completely revolutionized the methods of camping out. If you are going to the woods, read "Woodcraft" before you go. It may add to your trip a hundred fold. Price $1.00.

DOG TRAINING.

BY S. T. HAMMOND.

HE was a promising puppy, and when you turned him over to the breaker to be educated, you thought he was bound to make "the best dog in the world." And you'll not soon forget how disappointed and disgusted you were when the dog, the breaker and the big bill—all three turned up together, and you saw that the animal's spirit was broken and it would take a steam calliope to make him mind. Now, this could not have happened if you had been wise enough to buy a copy of Hammond's book, and in your odd leisure moments *train* the dog yourself instead of having him *broken* by some one else. We are selling edition after edition of this book, and it is revolutionizing the system of preparing dogs for work in the field. Price $1.00.

SHORE BIRDS.

A PAMPHLET for those who "gun" along the shore. Tells of: I. Haunts and Habits—Where the bay birds live and what they do at home. II. Range and Migration—Where they go to breed and where to spend the winter. III. A Morning Without the Birds—An episode of shore shooting. IV. Nomenclature—A list of our American species of *Limicolæ*, with a description of each species. V. Localities—Where to go to shoot them. VI. Blinds and Decoys—How to shoot them after you have reached the grounds. 45 pp., paper. Price 15 cents.

ANGLING TALKS.

BY GEORGE DAWSON.

AS a political writer of conceded power, Mr. Dawson wielded a trenchant pen; when he turned from the conflict of parties to the praise of the favorite pastime of "simple wise men," his essays, limpid as the crystal streams, are aglow with the soft summer sunlight and melodious with the songs of birds. When angling was the theme, he wrote from a full heart and in closest sympathy with the scenes and pursuits described. These "Talks" are brimful of manly, wholesome sentiment; there is in them all not a particle of cant. Their sincerity and overflowing spirit at once win the reader, and he perforce shares the author's enthusiasm. The effect is magical, like that of the mimic players in Xenophon's *Memorabilia:* he who reads, if he be an angler, must go a-fishing; and if he be not, straightway then must he become one.—*Extract from Publishers' Preface.* Cloth, price 50 cents.

CANOE "AURORA."

BY DR. C. A. NEIDÉ.

A CHARMINGLY written and always entertaining account of a canoe cruise from Lake George, New York, down the Ohio and Mississippi Rivers to the Gulf of Mexico, by the Secretary of the American Canoe Association. To read the cruise of the "Aurora" is the next best thing to having made it; and the reading is decidedly more pleasant than would have been participation in some of the misadventures related. 216 pp., cloth. Price $1.00.

Any of the above books can be obtained in London of Davies & Co., 1 Finch Lane, Cornhill.

THE DIAMOND BADGE

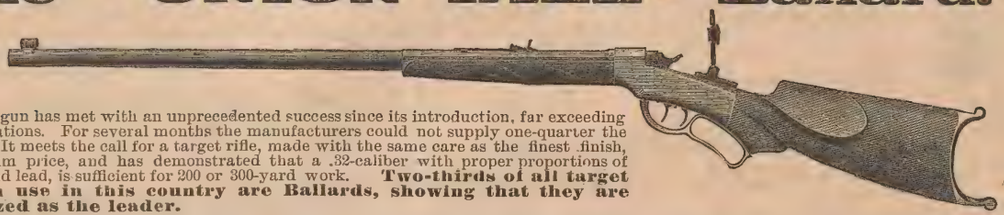
Of the Illinois State Sportsman's Association was won in 1884 and 1885

BY A

DALY GUN.

Charles Daly	Hammerless,	$125.00
"	Diamond Hammerless,	225.00
"	Hammer Gun,	$80 to 125.00
"	Diamond Hammer Gun,	200.00

DALY GUNS do the best work of any guns in the WORLD. After years of severe use they are as sound and tight as when first shot. They are equal to so-called London guns (made in Birmingham) of twice the cost.

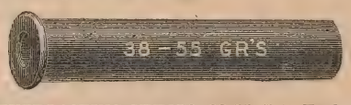


For Sale by { F. P. TAYLOR, 70 Madison Street, Chicago, W. R. SCHAEFER & SON, 61 Elm Street, Boston, } And all the leading Gun Dealers in the U. S.

Sole Agents, SCHOVERLING, DALY & GALES, 84 and 86 Chambers Street, New York.

ALSO HEADQUARTERS FOR

The Celebrated PIEPER Guns. HARRINGTON & RICHARDSON Hammerless Guns. The AMERICAN Single Breech-Loader. MARLIN & BALLARD Rifles—Don't forget the new Marlin combined tool for reloading magazine rifle cartridges. STANDARD REVOLVERS. Harrington & Richardson New Extracting Revolvers. AMERICAN ARMS CO. Extracting Revolvers. L. M. C. Breech-Loading Implements.



The "UNION HILL" Ballard.

This gun has met with an unprecedented success since its introduction, far exceeding all expectations. For several months the manufacturers could not supply one-quarter the demand. It meets the call for a target rifle, made with the same care as the finest finish, at a medium price, and has demonstrated that a .32-caliber with proper proportions of powder and lead, is sufficient for 200 or 300-yard work. **Two-thirds of all target rifles in use in this country are Ballards, showing that they are recognized as the leader.**

Prices: { No. 8.—Half Octagon Barrel, Pistol Grip Stock, Cheek Piece, Nickeled, Off-Hand Butt Plate, Double Set Triggers, Graduated Peep and Globe Sights, 9½lbs., 28 and 30 inches $37 50
No. 9.—Same, but with Single Trigger 33 00
Can be furnished with Vernier's Mid-Range and Wind Gauge Front Sights for $6.50 extra.

CANOE

THE FOREST AND STREAM began a year ago the publication of a series of papers on canoe construction, by Mr. W. P. Stephens, of the New York C. C., widely known as an expert on canoe design and building. These papers, having appeared through the year in our columns, have since been rewritten, and with numerous additions are now published in a handsome volume under the title of "Canoe and Boat Building for Amateurs." Mr. Stephens is peculiarly fitted for the preparation of such a work, beginning as an amateur, and having after a long experience of the difficulties attending a learner, taken a prominent place among canoe builders, due both to the model and workmanship of his canoes. Realizing fully the difficulty of explaining to a novice an art in itself far from easy,

AND

and with which he is entirely unfamiliar, the book begins with a description of the various classes of canoes in general use, with their main features and dimensions, and definitions of the terms used in connection with them. Numerous examples of canoes are given, and in connection with them, such plain instructions in designing as will enable the beginner to select intelligently the proper craft for his pur-

BOAT

pose, and to plan her dimensions, details and fittings. To this end designs of all classes of canoes are given, with full dimensions and details. The object has been not merely to enable the tyro to build one boat as described, but to teach him the principles of designing and building in such a way that he may construct such a craft as he desires. Following the chapters on designing, the construction of a canoe is taken up in detail, the tools and appliances being first clearly described, as well as the various materials, after which follows the actual work of building. Every operation is taken up in order, from the selection of the keel to the varnishing of the finished boat, and illustrated with numerous diagrams.

A chapter on sails describes all the varieties in use by canoeists, down to the new Mohican settee, with directions for making, rigging and measuring them, while the method of proportioning the sails to the boat is clearly explained, all the calculations

BUILDING

being worked out in detail. The many minor points of a canoe, paddles, steering gears, rudders, aprons, and camp outfit are also described at length, while a chapter is devoted to canvas canoes.

The subject of boat building is fully treated, a rowboat of the usual construction being taken as an example, and described in all its parts in such a manner as to make clear the principles involved, and their application to any form of boat, either lapstreak or carvel build. Each of the numerous technical terms belonging to the subject is defined clearly when it first occurs, and as the index is full and complete, the book is in itself a glossary.

In addition to the numerous diagrams in the body of the work, twenty-four large plates are printed on bond paper, containing the working drawings of canoes for paddling, sailing, cruising

FOR

and racing, with their sail plans, rowing sailing boats, large canoe yawls, and various boats for special purposes, such as gunning boats, yacht boats, and the widely known sneakbox.

The canoe yawl, a boat between a canoe and a yacht, is illustrated by examples of various craft from 17 to 20ft. long, and suitable for a crew of two or three on a cruise. This class of boat, while little known among us as yet, is admirably fitted for cruising, and will meet the wants of many who object to a canoe as being too small, and yet desire a boat with the same excellent qualities. The boats and canoes illustrated are in all cases among the best of their class, the list of canoes including English, Scotch and American craft, and are all drawn

AMATEURS.

to scale, so as to be available as working drawings. The plates, for convenience in using, are placed loose in a tough manilla envelope and accompany the book.

Pp. 168, with 24 plates of working drawings. Price $1.50. Address,

GRATEFUL—COMFORTING.

EPPS'S COCOA.

BREAKFAST.

"By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast tables with a delicately flavored beverage which may save us many heavy doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame."—*Civil Service Gazette.*

Made simply with boiling water or milk. Sold only in half-pound tins by Grocers, labelled thus:

JAMES EPPS & CO., Homœopathic Chemists, London, England.

The English "Fishing Gazette."

Devoted to angling, river, lake and sea fishing, and fishculture.

Every Friday, 16 pages, folio, price 2d.

Volume VI. commenced with the number for January 7, 1882.

EDITOR—R. B. MARSTON

Free by post for one year for 12s. 6d. (say $3.20) to any address in the United States.

Sent direct from the office for any portion of a year at the above rate. U. S. postage stamps can be remitted, or money order payable to Sampson, Low, Marston & Co., the proprietors.

Contains special articles on all fresh and salt water fish and fishing; reports of the state of the rivers; reports from angling clubs; fishculture and natural history; where to fish; angling notes and queries; angling exchange column; notices of fishing tackle, books, &c., and other features.

HINDS' BLACK-FLY CREAM,

For Repelling

Flies, Mosquitoes, Midges and other Insects, and protecting the Skin from Sunburn, Irritation and Infection.

No Tar. No Stain.

GLENS FALLS, N. Y., June 15, 1884.

Mr. A. S. Hinds, Portland, Me.:

DEAR SIR—I have not sooner acknowledged the receipt of box of "Black-Fly Cream," as I desired to first test it; this I have now done on two fishing trips where I found the Mosquitoes, Black Flies, Punkies and Moose or Deer Flies in great abundance. Although all these pests swarmed about me, I found the *Cream a perfect preventive* against their bites when it was applied to face, hands, ears and neck. For many years I have sought after *the* insect repellent, and have tried all manner of compounds, but yours is the most thorough, at the same time cleanly and not disagreeable.

Yours truly, A. NELSON CHENEY.

Price, 25 Cents, Postpaid.

SOLD BY DEALERS IN SPORTING GOODS.

"Repellene,"

An infallible preventive of the attacks of Mosquitoes, Black Flies, Gnats and all other insects. Neat, clean and easily applied. Contains NO TAR, will not *stain* nor *injure* the skin, easily washed off, may be carried without danger of leaking or spilling. Price 25 cents per box. Agents—T. J. Conroy, 65 Fulton st., N. Y. ANSWERS TO CORRESPONDENTS.

With its compact type and in its permanently enlarged form of twenty-eight pages this journal furnishes each week a larger amount of first-class matter relating to angling, shooting, the kennel, yachting, canoeing, and kindred subjects, than is contained in all other American publications put together.

THE TRAJECTORY TEST.

THE increasing interest manifested in the proposed trajectory test shows that it will, in the language of the budding journal, "fill a long felt want." Some of the suggestions which have come in indicate that there is in some measure a misapprehension of just what we shall endeavor to get in the line of shooting statistics. It will not be a test of initial velocities nor of the accuracy of shooting by the several rifles tested so far as the bunching of shots is concerned; but with a carefully determined base line to start from, we shall fire a sufficient number of shots from each rifle to determine just what it is capable of doing in the direction of meeting that great desideratum of a hunting weapon—a flat trajectory.

To this end we have chosen several days in September, from the 23d onward, when in all likelihood the weather will be settled and quiet. A surveyor will first of all make a careful plot of the range, fixing the distance with the utmost accuracy and, determining a base line from which all the vertical measurements will be taken. A series of stakes will be firmly planted along the line of fire, and each one marked for distance and height. At 200 yards a strong platform of plank will be built, and on this will be placed the iron gun rest from which all the weapons will be fired. At 150 yards, at 100 yards, and at 50 yards screens will be placed and five shots fired from each weapon in succession as quickly as convenient. Each shot will be noted on the screen and on the paper ring-target to be employed. These paper documents will then form permanent exhibits, and their exact measurement will be a question for the expert to determine. All the data as to each rifle and the ammunition employed will be carefully noted, and instruments for fixing the shooting conditions, such as the force and direction of the wind, the barometric and thermometric records, will be provided.

A similar platform may be built at 100 yards for the smaller caliber of rifles now becoming so popular, and a sliding screen along the zone of maximum trajectory may also be put up. These, however, are matters not essential to the practical test, which, briefly stated, is to take from the ordinary gunsmith's stock the popular makes of hunting weapons, load them with factory ammunition, and see by the indisputable record of the screens just what they are capable of doing. To accomplish this requires just such careful surveying and subsequent manipulation as we have pointed out, and this we propose to have.

Already several of the manufacturers have sent us sample arms for the trial. What we wish and what we shall invite from the makers is a weapon of .40 to .45-caliber, of the arm they are pushing as their most reliable all-round hunter's model. It is to be taken from the stock, not a weapon fixed up for the test. We wish no special ammunition, though while the tests are in progress it would be a capital opportunity to try any cartridge loaded with particular reference to high velocity and consequent low trajectory. If there are muzzleloader advocates who desire to pit their arms against the breechloader, they are at liberty to use the firing rest and the other facilities, and in this connection we would especially desire the entry of an English express rifle from some well-known maker, and fired under the best conditions as to load, etc.

Everything done will be open and above board, and all who wish may come and witness the experiments. Full and exact particulars will be given in our columns prior to the time of test, in addition to the general features outlined above.

THE CHOICE OF A CHAMPION.

TO-DAY begins the real test of the work that has engrossed the attention of American yachtsmen since the first of the year, and has tried to the utmost the ability of the designers and the skill of the builders. The races heretofore sailed have not been conclusive, but only a part of the preparatory steps, and only with the start to-day begins a trial which will presumably be thorough and conclusive, and one on which a fair selection will be made. The number of races which will be sailed is not yet determined, but the committee have announced their intention to make a thorough test of the new boats. Should one or two races show a marked superiority in any yacht, no more will be sailed, but if such is not the case, the races will be continued until some definite result is reached. While the two new sloops will not be the only entries, no one supposes for a moment that any other than one of them will be chosen, as their size alone better fits them to match with Genesta, and being of more modern build and rig, they are in all probability faster than the older boats. How much faster they are in proportion to their size is what most yachtsmen want to know, and it can only be decided by the aid of the owners of the older yachts who will enter their boats in the races.

An open invitation has been extended to all sloops and cutters of 60 feet waterline to enter these races, but it is very doubtful whether more than four or five will enter against Puritan or Priscilla. A great deal of talk has been indulged in during the winter and spring about the speed of some "flyer" or the "lines fine as silk" of another, or a third "in full racing fettle" and only too anxious to annihilate the presumptuous Britisher; and now that the time for talking has passed, we hope these vaunted "fighting sloops" will make good the boasts of their friends and owners, if not, let us hear no more of their pretensions to a first place in the racing fleet. The races are emphatically in "our weather" and home waters, no undue restrictions are placed on any boat, and, though no prizes of money are offered, there is sufficient at stake to make the honor well worth contending for; no excuse is left for those who stay out.

It is to be regretted that the gentlemen with whom the selection of the American champion rests have been prominently identified with one of the competing yachts, virtually built and sailed by them, and in whose defeat or success they have such a deep personal interest; and this circumstance has given rise to various rumors that they will select their own boat at all hazards. We believe that such a suspicion is entirely unfounded, and that the committee fully appreciate the responsibility of the trust confided to them, and realize by this time that it is not a mere club regatta nor a match between private yachts that they are concerned with, but that it is a matter of national importance, and that they represent, not the New York Yacht Club, but American yachting. Justly or unjustly, a certain amount of blame will attach to them in the event of defeat, as in building one boat they have necessarily neglected the claims of all other and incurred some enmity in consequence. This, however, was inevitable in any case and is a matter of small importance. The main question is whether they have properly fulfilled their trust, and this will be decided by the popular verdict after the selection of a yacht has been announced.

JACK BLUFF AND BLUSTER.

THE method of hunting deer with jacks has been practiced in the Adirondacks for many years, with the approval and co-operation of hotel keepers and guides. The hotel men have defended the practice because it brought guests to their hotels; the guides have upheld it because it gave them employment. Not content with jacking in season, some of them have violated the law by June floating and the hotel tables have been openly supplied with unlawful venison. When criticisms have been made upon the practice, these hotel men and guides have been its staunch defenders.

Within the last few months a great change has come over these same jack-hunters—so far as their talk is concerned. When the deer-hounding law was proposed they lifted up their voices in a prolonged howl about the barbarity and exterminating effects of jack-hunting; and from that day to this the denunciation of floating has been persisted in so loudly that were noise any evidence of sincerity no one could question their motives.

But just how much honesty is there in the talk about floating? Why did we hear nothing about it before the hounding law was enacted? Do the men who have so much to say about it really feel what they say? Have the landlords and guides who have so long encouraged and practiced hounding suddenly awakened to see the enormity of the practice? Are they sincere? Or, on the contrary, is their indignation at jack-hunting only assumed and put on for effect? Is it anything else than bluff and bluster to divert attention from the brutality of hounding, and intended to make hounding appear legitimate in comparison with jack-hunting?

Just how hypocritical is a large proportion of this anti-jacking talk on the part of the advocate of hounding can very easily be demonstrated. If the FOREST AND STREAM should next week institute a campaign against deer floating in the Adirondacks, these very men, who have been most forward in their pretended opposition to the method, would halt, turn short about, and go off on some new tangent. The minute they suspected that steps might be taken to abolish floating, they would begin to declaim on the enormities of still-hunting, or whatever other theme they might think would divert attention from floating; and they would oppose a law against jack-shooting with all their might and main.

They may have occasion next winter to give proof of their true position on this question of Adirondack jack-hunting deer.

AFTER THE MEET.

THE main value of the annual canoe meet next to its importance as a social factor in promoting acquaintances and friendly feeling among canoeists, is the opportunity it presents for the exchange of ideas, and the stimulus it gives to the improvement of canoes and the extension of canoeing. Several of the principal novelties of this season are directly traceable to last year's meet, and already the races of this year have started several on a search for something better that will show good results at the next meet. A marked improvement in canoes, sails and camp outfit, was visible this year, the boats being mostly of better model and with improvements in the details of build, while the sails and rigging were more neatly made as well as of better proportions. The best of this year were probably better than last, but the improvement was in the rank and file, and there was a larger proportion of very good boats.

A visit to a meet by each individual is sure to have an influence on canoeing, starting an interest in it where not already established and waking up clubs and members to the improvement of their boats and their knowledge of sailing, and rousing a spirit of emulation with other clubs that is highly beneficial. Many have gone home from Grindstone with ideas and suggestions both for the improvement of canoes, the advancement of club interests and the extension of the Association; and now while the matter is fresh in mind is the time to put these ideas into practicable shape. Before they are forgotten or before some one else brings out ahead of you your pet idea or invention, register it as your discovery and let all fellow canoeists enjoy it with you through the columns of the FOREST AND STREAM.

GAME PROSPECTS.—The prospects for a good supply of ruffed grouse, quail and woodcock the coming season appear to be very flattering. We have received within the past few days intelligence from a large and varied section of country giving very hopeful accounts of the abundance of these birds. Ruffed grouse well grown and in full broods are reported more plenty than has been known for years. Quail are also said to be doing well and their cheery call is heard from almost every field. Woodcock were found plenty in June and the early part of July, but the wet weather has scattered them, and the shooters report that the large bags anticipated have not in many cases been realized, although the shooting has been fairly good. October will undoubtedly bring us some good sport.

SHAD IN THE HUDSON.—According to statistics gathered by Fish Commissioner E. G. Blackford the catch of shad in the Hudson River this year amounted to the sum of $176,225. The supply keeps up well in spite of the great drain upon it, and this is to be credited to the efforts of the Fish Commissioners of the State and of the United States, in keeping the river well stocked. No doubt more fish were taken and consumed along the river than are included in the returns made to Mr. Blackford.

PRESIDENT CLEVELAND having gone to the Adirondacks, the concocters of newspaper telegrams are devising a series of fishing yarns that shall not fall short of the lies told about Mr. Chester A. Arthur's recent salmon angling. Mr. Arthur's score for one week was stated to be ninety salmon; and the scribe who started the record probably imagined that salmon fishing is something like sorting over salt codfish in a commission house.

TROUT AS VERMIN.—An enthusiastic salmon angler, after a week's experience, will be quite ready to aver that trout in a salmon stream are vermin.

SPORT IN THE SIERRAS.

SOME ADDITIONAL INCIDENTS.

THREE days had been spent in a desultory manner by us all. Reading, writing letters, playing piquet and bean poker, a little mild fishing and hunting, served to pass the pleasant hours. During this time the "Terror" comes to the front on one occasion, and earns the name by which he is known in this veracious history—said name being conferred upon him by Miss O. in commemoration of his exploits. He and Will were out hunting small game, when the "Terror" spied a ground squirrel sitting upon a rock, swaying from side to side and acting in a strange manner. Creeping up close he shot it, and it rolled over into the chapparal growing around the rock, and dropped out of sight. Forcing his way to the spot, the "Terror" stepped upon the rock which his game had just occupied, and stooped down to part the bushes in order to look for it, when a rattlesnake gave his angry warning. It was the "Terror's" first experience with the *crotalus*, and he nearly dropped with fright, not being able to locate the sound—as few people are until accustomed to it—but knowing full well what it was. It would seem that his snakeship was out hunting that afternoon himself, and had his eye fixed upon the squirrel when the latter was shot, and when the body fell took possession of it. And so the "Terror" stood there, quaking in every limb, not daring to jump, as he could not tell in what direction safety lay. At last he saw the snake lying coiled beside the dead squirrel under the bushes, and drawing up he shot it through the folds with a charge of No. 6 shot, and bore it home in triumph. He still carries its rattles in memory of his first interview with a living rattler. It proved to be the largest specimen ever seen by any of the party. It measured four feet three inches in length, and ten inches around in the middle. The "Terror" also encountered and killed a second but smaller one the same day while out fishing in company with the ladies, and was then and there dubbed a "terror to snakes," a name of which a part still clings to him, and probably always will. Henry killed one near the house on the morning of the same day, and that evening Will and I found a ground or worm snake in the road, and it wasn't much of a day for snakes either.

This was the first living specimen of the worm snake I had ever seen, and was a great curiosity. It was about fourteen inches long and very glossy. Its tail was blunt, but had no shield such as is seen in the *Uropeltis*. The body was cylindrical; color light olive, fading into greenish yellow on the belly; eyes very small. It was semi-torpid, but after being moved about for inspection, began to burrow slowly into the sand, and with a scarcely perceptible movement gradually disappeared. When the tail had entered the sand I uncovered it and tried to pull the reptile backward, but found it could not be done without pulling it in two pieces, so firm a hold had it secured in the light sand. After examining it sufficiently we removed it to a place of greater safety, and set it free. That evening two more anglers, H. and W., arrived, and we had a merry crowd around the stove, when the chill night air drove us into the house and near the fire, as it does the year round at this altitude.

The ensuing day B. and myself went down the river after trout, and had a day's satisfactory fishing. We drove down about four miles, tied our horse among the trees, and fished a portion of the river I had never been on before. We both got full creels in about four hours' fishing in the middle of the day, the very worst time for trout to rise.

At one time, while standing on a boulder fishing a large pool, something in motion on the side of the mountain, on the opposite bank of the river, attracted my eye, and an attentive look revealed a large buck bounding down toward the stream. I turned to call to B., but he was just disappearing round the angle of the bank, and my shout was drowned by the roar of the rapids. It had been thundering heavily a few moments previously, and the reverberations had no doubt stirred the buck into action, as thunder generally has that effect. He came down and entered the water about forty yards above. I had been carrying a large revolver on all my trips up and down the river until this very day, when, having found it inconvenient, I had left it at home, of course. Let those laugh who have never been caught out in a similar manner. I felt as if I had both hands occupied and a fly on my nose. I had been hunting these mountains for days without success, and here a buck almost walks into my distended jaws and I am helpless. It was too "cussed mean!" There I stood, spellbound and motionless, watching with bated breath every motion of the noble game. He plunged into the water where the current was deep and swift, and heading up stream, suffered himself to be floated, a few feet at a time, down into the pool to a point opposite me. He was now so close that I could have cast the flies, which now hung idly dangling from my rod, upon his back. He was a four-spiked buck, in splendid condition, the fat actually shaking upon his quarters. He stooped his head and took a long draught of water, and on raising it again noticed me. At first he evidently did not fear me, but stood watchful, with eyes dilated and nostrils spread to catch the scent. Finally, throwing out his head horizontally to the full extent of his neck, with the tips of his antlers resting on his shoulders, he took one comprehensive sniff, and turning like a flash disappeared from sight up the bank. The air around that spot became very hot and sulphurous about that time, probably caused by the thunderstorm before mentioned, although it may be that leaving my revolver at home had something to do with it. For me the balance of the day was without light or warmth.

This adventure gave me the buck fever very badly, and the next morning Will and I took H.'s buckboard and horses and drove up a horrible road for six miles to get Will's horses, which he had turned out to graze, and to have a hunt. We started early and traveled up a cañon with a dangerously steep grade, until reaching the summit of the mountain, where we found a piece of fine grazing country. While going up the mountain, Will pointed out where his dog treed a bear the previous summer, and as there was considerable ingenuity displayed in the bear's capture, I will relate it in Will's own words; said he, "I was going up after my horses to the same place we're going to-day. I had a big shepherd dog with me, and he came across the bear in that big clump of willows over there, and ran him right up that tree, where he sat chompin' his teeth and growlin' and foamin' at the mouth. I hadn't my rifle with me, and I knew that if I went back after it the dog would leave the tree, and how to get him I couldn't think. At last I thought out a plan, and startin' in, I gathered all the brush and logs I could carry or roll, and built a big circle around the tree and set fire to it. After it got to burnin' good, sez I, by geewhillikens! if he tries to come down now he'll get well singed anyhow, and off I started for my rifle. Just as I expected, the dog soon left and followed me; but the fire was a better stayer, and when I got back the bear was mighty uneasy but was still there, and I brought him down with a shot in the stickin' place." If the reader will remember Captain Cuttle's advice and "make a note on't," this incident might come handy at some future time.

We reached our destination at an early hour, and securely tying our horses started out after a buck. Our course at first lay along the crest of the mountain ridge on which we were, and which separated the stream we had left in the valley, from a large branch which lay to the south. The view from this point was worth ten times the journey to see. At one spot a pebble flung into air would have dropped nearly 3,000 feet into the bed of the stream below. A sea of mountains rolled away, wave upon wave, to the south, until their snowy peaks melted into the blue of the sky. Upon the opposite side of the cañon the streams from the melting snows could be traced in lines of glistening light as they glided over the bare slopes of granite to the river, brawling so far beneath us that its voice could not be heard. But why dwell upon it when all these Sierra views are so grand? Come and see for yourself what nature can do in this glorious western land! After a time we turned back across the crest, and followed down a flat ravine for a couple of miles without seeing any game, only a couple of fawns. They were both well grown, but neither of us would shoot them, nor would we allow the dog to chase them. We now struck upon ground which had been pastured by sheep, and the soil was as bare of herbage as if fire had run over it. We were getting a little discouraged as we had traversed some splendid hunting ground without effect, so we left the ravine down which we had come and struck over into another running in the same direction, with the intention of hunting back. Here old Turk soon gave tongue, but the deer ran out ahead of us and the dog's voice was soon lost to hearing over the ridge. We toiled on, up opposite sides of the ravine, about 150 yards apart, until tired, when I suggested that we sit down and wait for the dog, as we might be leaving game behind in the willows which lined the bottom of the hollow between us. We both chose a soft rock to sit down upon and rest, and talked across to each other some ten minutes, when cr-r-rash went some heavy body in the bushes directly below and between us, and out jumped a buck upon Will's side. He had been lying there all the time waiting for us to pass by, but our lingering in his neighborhood had rendered him suspicious, and he made a dash for safer quarters. This was the most foolish move he ever made, for had he lain still we would soon have passed him by. I instantly "turned loose" upon him as soon as he broke cover, and wounded him severely, the bullet entering just beside the root of the tail. He turned down the ravine, and I fired again, the second bullet entering within an inch and a half of the first. This brought him down, and Will ran up and finished him with a ball through the neck and then cut his throat. At last I have got my buck, a fine three-spiked one, and I am satisfied. I remain in charge of the venison, and Will goes back for a horse to pack it out. He returns in about two hours, and I set my rifle against a tree in order to assist in putting the carcass upon the horse's back. Just as we are raising it to the saddle we notice the horse looking intently down the ravine. Will turns his head to see what it is, and there stands another buck watching us at a distance of sixty yards. Will dropped his end, too quick, and sprang for my rifle, having left his own at the wagon. Not understanding the mechanism, he cannot use it, and by the time he has tried it twice without result, and then handed it to me, the deer has disappeared among the timber. We console ourselves by saying that we already have venison enough, and get back to the wagon as soon as possible. After an hour's search Will secures the horses he came after, and we return homeward.

AREFAR.

Natural History.

LIFE ON THE SEASHORE.

A GOOD deal of pleasure, to say nothing of instruction, is to be got from keeping one's eyes open to what is curious and wonderful in the works of nature. People who take their summering at the seaside miss a great deal if they fail to acquaint themselves with the appearance and habits of some of the common animals that abound everywhere on the shore. By taking a walk along the beach at low tide, or better still by going out in a boat and searching the shallow water in the neighborhood of rocks, many interesting forms of life may readily be found.

In taking a walk along one of the Cape Ann beaches the other day I saw at least half a dozen of those exceedingly curious creatures which go under the common name of jelly fishes. I have heard that Agassiz once showed a friend one of these animals in an aquarium and asked him what he thought it looked like. His friend replied that he thought it resembled animated water. Any one who has seen some of the smaller species of these animals will recognize a good deal of appropriateness in this definition. One has to look sharply to see them at all, so delicate and so perfectly transparent are they. They may be found most abundantly on a quiet evening gaily swimming about on the surface of the water by alternately opening and shutting their umbrella-shaped bodies. Probably not one person in a hundred who has seen these curious beings knows anything about their wonderful life history. The transformations which they undergo in their development are among the most remarkable exhibited by living things. Jelly fishes are, in fact, nothing less than the offspring of those delicate plant-like organisms which grow on all shores attached to common seaweed, rocks, etc., and which are known by the common names of sea mosses and sea firs. These names, of course, give an erroneous notion as to their nature, for notwithstanding their decidedly plant-like appearance they are true animals. It is not to be wondered at, however, that the mistake of regarding them as plants is so common, for the naturalists themselves were for a long time puzzled to know to which kingdom of living things they belonged. The old observers, thinking they saw in them the character of both, ingeniously called them zoophytes, a word which means animal plants. The name now applied to them is hydroid zoophytes, or simply hydroid. If one of these organisms be carefully examined in the summer, little bud-like swellings may be seen attached to its stem. These little buds after a while detach themselves and, strange to say, develop into the comparatively gigantic jelly fishes. It seems scarcely credible that such a transformation can occur, but no fact of science is better established. The special function of the jelly fish stage of the hydroid is the production of the elements required for the reproduction of the species. When this has been accomplished the jelly fish dies, the embryo to which it gave rise are at first free-swimming, but after a while they attach themselves to some rock or weed and develop not into jelly fishes like those from which they sprung, but into the plant-like hydroids. These changes furnish an example of what the scientists call "alternation of generations."

I have seen more of those exceedingly graceful animals, that go under the rather homely name of squid, the present summer than for several years previous. In some places the beach is strewn with them, they having been cast up by the tide. I doubt if there is any animal in the sea prettier than this when seen in his native element. The delicate, ever-varying flushes of color that constantly chase one another over his back and sides are not to be compared with anything I know of, and for quickness, variety and gracefulness of movement he is not to be outdone. It is interesting, too, to watch him thrust his ten long sucker-tipped arms to and fro in the water in his search for food. And then he has a curious way, not possessed by any other animal so far as I know, of suddenly darting straight backward. He accomplishes this feat by means of a peculiar internal organ by which he is able to throw out from his body at will jets of water, the reaction of which gives him his backward movement. If you disturb a squid while in the water he suddenly envelops himself in an inky cloud. This is for the sake of protection, and is accomplished by a special organ called the ink bag, from which the animal discharges a black fluid.

Though the squid is such a handsome fellow, he has some near relatives of a decidedly unattractive sort. Those wierd creatures, the octopi, described by Hugo in one of his novels, though not quite correctly, it is said, belong to the same order. It is by means of cup-shaped suckers just like those of the squid, except that they are very much larger, that the octopi hold their deadly grip on their victims, while with their long arms they squeeze them to death. It is said to be quite a common thing in some of the islands of the Pacific for the natives to be attacked by these creatures. I have read that they always take an axe with them in their boats with which to cut off the arms of the octopus in case of attack. It is only in this way that they can free themselves, for when the creature has once fixed his suckers no strength a man could exert would be sufficient to pull them loose.

One of the most common animals of the seashore is the little crustacean which goes under the common name of the hermit crab, the animal being so called from the fact that it is always found inhabiting the shell of some dead mollusk, as the common snail. The little creature presents a curious and interesting sight as he sits in his stolen house with his strong nipping-claws, watchful looking stalked-eyes, and long feelers projecting out from the open door. Though apparently so vigilant and well armed he does not always show hostility at the approach of his foes. On the contrary he more often takes the rather cowardly course of withdrawing himself completely into his shell and there remaining until his enemy has gone by, when he again cautiously ventures forth. Of his two nipping-claws one is always larger than the other, and when he has thus withdrawn himself into his shell he always uses the larger one as a kind of plug to close the entrance.

It is interesting to notice the reason why the hermit crab thus appropriates the shell of another animal. It is because the hinder part of its body, or abdomen, unlike that of other animals of the same group to which it belongs, is not protected by a hard crust, but is quite soft. In the common shore crab and in the lobster, for examples, this part of the body is covered with a hard calcareous crust which acts as a shield against the attacks of their enemies; the hermit crab, not being provided with this natural means of defense, is

obliged to resort to an artificial one. The animal is provided with special appendages by means of which he keeps a firm hold upon his borrowed dwelling, and it is a very difficult matter to get him loose from it. I have known a crab to suffer himself to be pulled to pieces before he would give up his shell. When a crab has grown too large for the shell he is occupying he leaves it and seeks another. It is said that if they are not able to find another empty shell they attack other crabs, and if they succeed in overcoming them, take possession of their shells. They seem to be rather quarrelsome fellows, at all events, for I have seen two of them fighting over a piece of mussel, while if they had eaten it quietly there would have been plenty for both.

Any one who has had the opportunity and has failed to look for sea-anemones attached to the sides of rocks just below low tide mark has thrown away the privilege of seeing one of the most beautiful of all forms of life in its natural habitat. With their delicately tinted cylindrical bodies surmounted by a crown of soft feathery tentacles gently expanding and contracting in the water, they show themselves worthy of the name of sea-flowers, by which they are commonly known. I could readily mention many other forms of life, some of which are quite as interesting as those already named. Such are star-fishes with their five radiating arms and curious sucker-tipped tube-feet; sea urchins looking so secure in their bristling coat of spines; ophiuroideans with their long snake-like arms; and lobsters, of several of which I have caught glimpses lately, and which looked quite as handsome in their native domain, clad in their brilliant-colored coat of mail, as they taste delicious when converted into a salad. Those whose summer rambles take them to the sea-shore will find a pleasant way of spending odd hours in examining these forms of life for themselves. S.

Annisquam, Mass., Aug. 6.

THE PTOMAINES.

THERE have lately occurred two or three cases of death through blood poisoning from bites that must present features of peculiar interest to those scientists who are prosecuting experiments with human saliva, which is now known to possess more or less of toxic qualities. In one case a little girl of four years and a half was bitten on the arm by another little girl of five years of age. The wound was very slight—a mere graze—of which the mother at first took no particular notice; but next morning the arm being much swollen and inflamed, she took the child to the nearest hospital. The house surgeon there attributed the inflammation to the state of the stomach, and merely ordered a simple poultice and some cooling medicine, not suspecting any danger. Probably the ptomaines and poisonous saliva had not formed a part of that doctor's curriculum. The child grew rapidly worse and died the third day after the bite. A post mortem examination showed that death had resulted from acute blood poisoning, caused, as was then perceived, by this by no means deep bite.

This remarkable case at once recalled one or two similar occurrences related to me only a short time previously by my friends, Dr. Yarrow, U. S. A., and Dr. R. W. Shufeldt, of the Army Medical Museum, Washington, D. C., in conversations on the subject of human bites. It besides bears a certain analogy to snake bite, and suggests a few words in reply to an oft-repeated inquiry—How is it that while one may die from a very slight snake bite, another person may recover from an apparently serious one? The amount of venom injected, the condition of the victim, as also that of the serpent supply the reason. While a feeble or an unhealthy person might succumb to the merely superficial bite of a small rattlesnake, a stout and vigorous man may possibly overcome the virus of a full-sized one. It is merely a question of whether the bitten person's vitality is strong enough to conquer the poison. The little child's blood was in an unhealthy condition, probably also the saliva of the biter was contaminated by unsound gums (she had lost some of her teeth), or by remains of food in her mouth, or noxious "sweet stuff." Of these details we cannot be sure, while we are very sure that an extremely minute quantity of saliva in contact with the blood was fatal to this little girl, while many children are bitten by their playmates and far more severely, without any serious consequences. Dr. Shufeldt informed me that he had seen some very serious symptoms follow from the bite of an angry man. Many other cases could be cited in which death has ensued from the bite of persons and animals in whom no sign of rabies existed. It was not a mere figure of speech which the Psalmist uttered when he said "the poison of asps is under their lips," though we may doubt whether David intended to convey a scientific fact in that statement. Unfortunately, good as well as evil persons carry venom under their tongue; nevertheless, scripture when thus borne out by modern discoveries becomes invested with new force and interest.

These poisonous properties, both in saliva and in some other fluids of the human body are known as "ptomaines," a word introduced into the language some twelve years ago, and therefore found, if at all, only in our most recent dictionaries. It is derived from πτῶμα, a carcass, being the product of diseased or putrified animal substances. Prosecuting scientific experiments, Dr. Selmi, of Bologna, discovered in a corpse certain alkaloids singularly resembling such vegetable poisons as morphine, aconitine and others. It was subsequently discovered that these cadaveric alkaloids or ptomaines, as he named them, exist in living bodies as well as dead ones, in healthy as well as unhealthy human fluids, though predominating in diseased subjects. Simultaneously while Selmi was carrying on his researches at Bologna, Dr. Armand Gautier, of Paris, also discovered that these "alkaloids" are developed in putrefied blood, and in human saliva, which, under certain conditions, he found to bear a strong analogy with snake venom. Gautier obtained from healthy human saliva sufficient ptomaine to destroy birds when inoculated with it; and this saliva had not been contaminated by impurities in the mouth, but was procured direct from the duct of a salivary gland. Dr. Yarrow informed me of a similar circumstance that had come under his observation, viz., the saliva of a healthy man whom he knew, causing the death of a rabbit inoculated with it. I am indebted to Dr. Yarrow for a copy of an extremely interesting paper on "Some Recent Experiments on Serpent Venom," by Dr. Robert Fletcher, M.R.C.S.E., which was read before the Philosophical Society of Washington, May 19, 1883; and in this paper Dr. Fletcher shows the relationship between the new alkaloids and snake poison, which latter appears to differ from human saliva only in the intensity of its action. "Both serpent venom and ptomaines respond alike to chemical tests, and have the same reducing power," says Dr. Fletcher. "They are not ferments, heat, long applied, leaves them both as deadly as before. The toxic effect upon animals is the same in both." Worthy of consideration is the curious fact that while snake venom is found to possess strong peptic qualities, so that it is introduced into the pharmacopœia as a valuable medicine, human saliva is found to possess toxic properties, and each so important as a digestive agent in the stomach, should be so fatal in the blood of another individual.

The second case which has occurred within a year was the death of a gentleman from the bite of a pet monkey. The animal was not habitually vicious, but on the occasion which terminated so fatally, displayed a restiveness which induced its master to take it by the shoulders—one hand on each shoulder—and shake it. The monkey immediately turned and bit first one hand and then the other between the thumb and forefinger, causing the blood to flow. The wound on the right hand soon became a serious affair. It was cauterized, but in a week or two became gangrenous and was attended with faintness and exhaustion. The patient was already much out of health, which accelerated the danger, and in spite of skillful medical aid he died within three weeks. At the coroner's inquest it was stated that the bite of a monkey would not necessarily produce rabies, but that the deceased's constitution was in such a state that "anything," probably meaning any other bite, might produce the same effect. Similarly an unhealthy person has been known to die from the bite of a harmless—*i. e.*, a non-venomous—snake. Dr. Shufeldt told me he had once been compelled to carry his hand in a sling for many weeks from a wound caused by the bite of a common cat that had been suddenly disturbed. Instances might be multiplied in evidence of the toxic effect of saliva apart from hydrophobia, and which, prior to the discovery of the ptomaines, have excited the wonder of the ignorant, giving rise to superstitious beliefs. It is in this way that myths have prevailed which in due time science clears away.

One more point of interest in connection with the ptomaines is that, though a comparatively recent discovery or rather a lately recognized agent of mischief, the actually poisonous character which some human secretions assume under certain conditions has long been known. Dr. W. B. Carpenter, F.R.S., F.L.S., etc., of London, in more than one of his works has pointed out this, and also the fatal effects of the maternal nutriment on infants when the mother has yielded to violent anger or has been suffering under great mental excitement. "An absolutely poisonous character is almost instantaneously communicated to the milk, which has occasioned the death of the offspring." Anger or undue excitement acts on other animal secretions, as, for instance, the saliva, as we have seen. Though to moralize does not belong to the present subject, we cannot fail to see the lesson of caution conveyed in the various incidents related; more especially as regards the importance of maintaining sound health to enable us to combat danger.

Even more to the point than Dr. Carpenter's elucidations was a remarkable prediction of Dr. Weir Mitchell when describing his experiments with snake venom in 1868. Though not absolutely giving the name of ptomaines he yet anticipated both Selmi and Gautier in comparing the cadavers with serpent venom. In his published account (1868) he said: "The one form of poison which most resembles venom is that of putrefactive substances, and I am inclined to think that from putrefying material may yet be separated a substance which, concentrated, will prove active toxically and will perhaps enable the observer to repeat the facts I have witnessed here." The substance has since been "separated," and experiments have been "repeated," and by scientists in other countries in the pursuit of their own individual researches, irrespective, at first, of serpent venom, though this afterward shared their attention, and who were probably quite unaware of Dr. Mitchell's conclusions.

Dr. Fletcher speaks of these various discoveries as of "enormous importance in their relation to medical jurisprudence." That they may lead to the discovery of a thoroughly satisfactory cure—that is an antidote in the true sense of the word, to snake venom, and a cure for hydrophobia, two evils that have as yet baffled all skill, is now almost confidently anticipated. At the moment of concluding this paper, in which I have so loosely and lamely endeavored to simplify an abstruse subject, I read that M. Pasteur, of Paris, after five years' undivided attention and practical experiments, feels confident that he can provide an effectual prophylactic against hydrophobia. A prophylactic against snake bite may come next.

Catherine C. Hopley.

London, England.

ORNITHOLOGICAL INQUIRIES.

THE inquiries instituted by the new Department of Economic Ornithology at Washington are set forth in the following circular, copies of which may be obtained of Dr. Merriam:

The fact that birds are instrumental factors in checking the increase of insects injurious to vegetation has long been recognized, but the extent of the services thus rendered has never been positively ascertained. Moreover, great difference of opinion exists, particularly among farmers, as to whether certain well-known species are on the whole beneficial or injurious; and many kinds which are really of great paactical value are killed whenever opportunity offers. For example, hawks and owls collectively are almost universally regarded as detrimental, while as a matter of fact several of them never touch poultry but feed almost exclusively on mice and grasshoppers.

The wholesale slaughter of small birds has been known to be followed by serious increase of noxious insects. On the other hand, invasions of insects which threatened to devastate large tracts of country have been cut nearly short by the timely services of our native birds.

In view of the above facts, and many others which might be cited, it is clear that a comprehensive systematic investigation of the inter-relation of birds and agriculture will prove of enormous value to farmers and horticulturists. Such an investigation has been undertaken by the newly-established branch of Economic Ornithology under the Division of Entomology of the Department of Agriculture, and the assistance and co-operation of persons interested are earnestly solicited.

The food of all birds consists either of animal matter or vegetable matter or both, and its consumption must be serviceable or prejudicial to the interests of mankind. Therefore, according to the food they eat, all birds may be classed under one of two headings—beneficial or injurious. Many species are both beneficial or injurious, and it is impossible to assign them to either category until the precentages of their food elements have been positively determined and the sum of the good balanced against the sum of the evil.

In a very large proportion of our small birds the food varies considerably with the season, sometime changing from vegetable to animal, or from injurious to beneficial. Furthermore, many birds feed their young upon substances which the adults rarely or never eat; and the young on leaving the nest sometimes greedily devour things which are discarded as they grow older. Hence, it becomes necessary to ascertain the food of each species at different times of the year and at different ages. Information is desired on all questions relating to this inquiry, and special attention is invited to the following:

a. Has the common crow been observed to catch young chickens or to steal eggs? *b.* Has it been observed to eat corn or other cereals in the field? If so, how long after planting, and how extensive was the injury done? Has the crow been observed to feed upon injurious insects? If so, what kinds of insects were thus destroyed, and to what extent? *c.* Has the crow blackbird or grackle been observed to carry off the young of the robin or of other small birds, or to destroy their eggs? When breeding near the house, has it been observed to drive off small birds (such as robins, bluebirds, etc.) which had previously made their abode on the premises? Has it been observed to eat corn or other cereals in the field? If so, how long after planting, and how extensive was the injury done? Has the crow blackbird been observed to feed upon injurious insects? If so, what kinds of insects were thus destroyed, and to what extent? *d.* Has the naturalized exotic, the so-called "English sparrow," been observed to drive off any of our native birds? If so, what species were so expelled from their former haunts? Has this sparrow been observed to feed upon cereals or other farm crop? If so, what kinds were injured and to what extent? *e.* Has the "English sparrow" been observed to feed upon or wantonly injure grapes or other fruits? If so, to what extent? What measures, if any, have been adopted to remedy the evil? *f.* Have the robin, cat bird, brown thrasher, Baltimore oriole, or other birds been observed to feed extensively upon fruit? If so, what kind or kinds of fruit has been most injured by each species, and how extensive have been the depredations committed? *g.* What birds have been observed to feed upon or otherwise injure buds or foliage, and what plants or trees have been so injured? *h.* What birds, if any, have been observed to feed upon the canker worm, army worm, tent caterpillar, cut-worm, cotton worm, cabbage worm, currant worm, Rocky Mountain locust or other grasshoppers, periodical locust (*Cicada*), Colorado potato beetle, chinch bug, Hessian fly, or other noxious insects? *i.* The bobolink (ricebird of the Southern States) and red-shouldered blackbird congregate in vast flocks during their migrations and commit extensive depredations in certain parts of the South. The Division will be glad to receive detailed accounts of these depredations from persons living in the affected districts. *j.* What birds are considered to be injurious to crops and small fruits, and what kinds are regarded as beneficial? On what facts are these opinions based? *k.* Has any kind of bird been observed to feed upon the honey bee? If so, what species, and how extensive has been the injury done?

In the investigation of economic ornithology many important secondary questions present themselves. Among them, the following may be mentioned as bearing directly upon the subject of injury: 1. At what season and for how long a period is the bird present? 2. If a summer resident, how many broods does it rear each season, and how many young constitute an average brood? 3. Does it take up its abode near the habitations of man, or does it inhabit districts remote from civilization? 4. Does it inhabit marshes, uplands, cultivated fields, or forests? 5. Where does it make its nest? 6. What places does it frequent in search of food? 7. Is it solitary or gregarious? 8. What effect does the settlement of a region have upon its bird life? 9. What birds, if left to themselves, are likely to become most abundant as the country grows older? 10. Has any increase or decrease been observed from year to year in the numbers of any kind of bird in the same locality? If so, can such change be attributed to altered conditions in the bird's breeding grounds? If not, can any cause be assigned? 11. Has any increase or decrease of one species been observed to affect the numbers of another species? If so, can the fact be explained? 12. Has any species disappeared altogether? If so, can a cause for this disappearance be assigned?

Persons willing to aid in the collection of birds' stomachs will, on application, be furnished with the necessary blanks and instructions. Until Oct. 1 all communications should be addressed to Sing Sing, N. Y.; after Oct. 1 to the Department of Agriculture, Washington, D. C.

Dr. C. Hart Merriam, Ornithological Agent.

Range of the American Bison.—Late issues of the St. Paul *Pioneer Press* report: "Reliable cowboys just arrived in Miles City, Mont., report that at the Lower Musselshell round-up they saw a fresh trail of about 100 buffalo on the head of the Big Porcupine last week, and had seen twelve head a few days before. They killed one out of the twelve. The number of wild animals on the North Yellowstone ranges have proved not only a source of annoyance to herd owners, but also of great damage to these newly stocked ranges. Round-up parties, in scouring those districts this spring, complain of the great number of calves killed and crippled by wolves and other wild animals. On Custer Creek calves were found that suffered from torn and bitten backs, which the boys attributed to the attacks of wildcats. Had the calves been hamstrung the work would have been charged to wolves instead of wildcats. The loss from the above source is probably greater than most people would imagine." The Maginnis boys met on their last trip probably the last remnant of the mighty herds of bison that once roamed over these plains. About 200 wanderers were encountered in Flatwillow Creek bottoms, and for a time the round-up lived on succulent, juicy buffalo humps instead of choice Montana beef."

Antidote to Scorpion's Sting.—Already an antidote has been discovered to the sting of scorpions, which although rarely fatal, are extremely painful, and the poison is closely allied to that of the venomous snakes. Mr. A. M. Markham, of the Indian Civil Service, has written to one of the Indian papers calling attention to the fact that the root of *Achyranthes aspera*, known popularly as *chirchirra*, affords almost instantaneous relief from the pain caused by the sting of a scorpion. The plant is very common everywhere in India, and is one of those whose clinging burrs are such a nuisance on one's legs when out shooting. The root, macerated in water, is applied to the part stung, and a small quantity is drunk in water. If this be done quickly, there is absolutely no pain half an hour or so after the sting, instead of the twelve to twenty-four hours of intense suffering which follow an untreated sting.—*London Standard.*

SHOOTING ABOUT VICKSBURG.

PROBABLY there are not a great number of places in the United States more favorably situated for the sportsman than Vicksburg. I read with considerable interest and curiosity of men of means throughout the country, mainly in the East, forming clubs and spending thousands of dollars for shooting and fishing grounds, erecting expensive buildings, and employing men to look after their property. The grounds are often at long distances from the homes of the owners, involving expense and time in reaching them. Even then frequently the sport is not first-class. Such a course is to be approved, for it gives relaxation to the owners and protects in a needful way our game and fish from the ravages of the pot-hunter and law-breaker. But here at Vicksburg—and there are other places in the South probably as favorably located—within a radius of fifty miles the finest sport can be had, either in fishing or hunting, with no expense except for transportation, ammunition and camp.

Quail are abundant everywhere, both in the sedge grass in the hills and in corn and cotton fields of the bottom lands. Doves are also plentiful in certain localities where peas have been sown. North of here within fifteen miles black bears, wild turkey and deer (the last not so numerous since the destructive overflows of 1882 and 1883–4) can be found. Further on in the swamps of Yazoo, Big and Little Sunflower rivers, Steel's Bayou and Deer Creek they become more numerous, and the two former quite plentiful, while the deer are increasing. It is no difficult task to get a bear, hunted by a man who understands them, either with dogs or by still-hunting. There are planters who complain of the depredations of this animal, for he is fond of a fat pig and gourmandizes on the succulent corn when in roasting ear.

I am not a turkey hunter but can call them very well in gobbling time. I have on different occasions had three gobblers answering my call at the same time, and have had two noble fellows within thirty yards, side by side, making the deep woods resound to their music as they searched and peered for what they took to be their lady love. From our camp during a ten days' hunt we never failed to get an answer in early morning to our first or second call. I will never tell how many fair shots I had at turkeys that trip, and how many were killed. I was shooting them in the body then with BB's, whereas the proper thing to do, as I afterward learned, was to shoot at the head and neck—vital parts—with 4s, 5s or 6s. As to squirrels, they abound in the woods everywhere; in the hills the fox and gray, and in the swamps mainly the black. Mallard, pintail, butter ball, baldpate, green-winged teal and a number of other ducks, this is their winter home. They begin to arrive here in October before frost and remain until in April when the willows are green with leaves. The wood duck, as noble a bird as any of them, both in flavor of meat and beauty of plumage, breeds here, and can be seen skimming over the lakes and rivers the year round, though they are not shot except in winter. The green-winged teal feeds almost exclusively upon grass seeds and swarm upon the river bars where grass grows luxuriantly at low stage of water in latter part of summer and fall. The larger ducks feed upon acorns of which the woods are full, and also upon grass seed. The mallard is the most secluded and mainly haunts the dense swamp, finding abundance of food and water there. They are often, however, killed in great numbers by persons who search out their feeding grounds and lie in wait for them. Some marvelous tales are told of the number killed at one discharge of both barrels of the gun, which I would not like to repeat. If some of these could appear in your column of "Remarkable Shots" some of the grand liars who write therein would be completely overshadowed. The man who froze his bullet in mid air after having fired it, thawed it out next spring, killing sundry things, would be set at rest as a weakling forever.

Lake Centennial, in front of Vicksburg, formed in 1876 by a cut-off of the Mississippi River, has a great extent of willow bars which formed and grew up after the cut-off, and here is a great resort for the green-winged teal and other species. During the winter thousands and thousands of them can be seen from the city, and many a one has fallen within sight and sound of the town. When not at the business ourselves, it has been a favorite diversion of my brother (your "B. H. P.")and myself to go upon the gallery at sundown, and from our elevated position on the hill, some 250 feet above the water level, watch and listen as dusk sets in for the firing of the numerous guns as the local sportsmen dealt out death to the gamy teal as they came in to roost. Then, and at early dawn the shooting is best, though it is often excellent throughout the day, particularly in stormy weather. The best shooting is to be had over decoys, though the large majority of sportsmen take their chances without this aid, making often creditable bags. As an instance of what can be done, I will give you the record of the shooting by "B. H. P.," and another, generally myself, in December and January of 1883-4, as I copy it from the record which we keep of all our shooting: Dec. 6, 20 ducks; Dec. 7, 13; Dec. 8, 21; Dec. 11, 14; Dec. 17, 58; Dec. 18, 84; Dec. 22, monkeyed around northeast shore and got 5; Dec. 25, evening shoot, 40; Dec. 26, morning shoot, 75; Dec. 27, 65; Dec. 31, 18; Jan. 1, 50; same day in the afternoon, 39; Jan. 8, retrieved 64, got frozen in the ice, abandoned 8 or 10, and had great difficulty getting out of the ice into open water, not reaching home until 10:30 P. M., where we found Mrs. P. a shade nervous; Jan. 24, 5. This shooting was done over decoys by killing single birds. Nearly all were the green-winged teal, as sweet and juicy a duck as ever fell to crack of gun. Last winter shooting on this lake was not nearly so good, the bars having been covered with water too late in the season for maturing grass seeds. We got some fine shooting though by going a little distance away, though at some ill-convenience for transportation. We found that if we could go just at the right time, when the weather was stormy or cold, or, what is better, both the stage of the river being right—for giving access to certain grassy localities where the birds delight to splash and feed—we could generally get what we wanted, and have excellent sport.

Now I will tell you something. A party of about four of us have made an arrangement by which we expect to be able to get there just in the nick of time. It may be at Kent's Island four miles below, Delta Bar two miles below, Block Island eighteen below, Pawpaw twenty above, the "towhead" in Old River, or Steel's Bayou nineteen miles away, or some places further we know of; we expect to travel on the same schedule time with the ducks. Powell & Douglas, of Waukegan, Ill., are going to build us a launch with capacity for four or more and outfit, and speed sufficient to stem these currents at a lively gait. When the ducks get too frisky—saucy with their extra fat and juicy meat—we propose to steam away in the forenoon, examine their maneuvers and locate and build a "daisy" blind just in the edge of the willows, open at the shoulders for wing shooting, put out a snug fleet of decoys twenty or thirty yards away among the floating grass seed, take them as they come in from sundown till dark, slowly at first, lively at the close; then take up decoys and a snug bag, and push for home, enjoying the whole trip, and undergoing no particular hardship. A tent and cooking vessels will be a part of our paraphernalia, but not so frequently used. Thus without large outlay for the purchase of grounds or the employment of game keepers, or the fatigue of a 50 or a 100-mile journey on the cars or steamboat, or by vehicle, we expect to find sport such as can be obtained by but few.

We have launched it a little heretofore, and have an inkling of what is in store in the way of enjoyment. And then we will have events. We have not quite forgotten a certain trip when our tub refused to draw, and we had to tie to a "sinker" in the middle of Old River to rest the concern while a few more pounds of steam were raised, and finally had to move nearer shore, cast anchor, put out the fire, and with a limb clean out the flues before we could budge, failing by a few hours of reaching "McKee's Pocket"—where ducks were in great numbers—in time for the evening shoot, the soot blacking us to such a degree that it required no little explanation to account for our condition at home. Of course, P. & D. will give us a boat that won't use us in that way; but how are they to make one that will not wedge into a mud bar or climb on "Davy Cake," a buckshot bar in center of Old River. An old pilot told us how to run the river at the "Cake." "Keep the west bank until a certain pair of trees near the edge of the water were reached, then cross." In daylight going up we dodged this thing, but one night, coming down under a full head of steam with the flues cleaned out, which meant considerable with that boat, we rapidly slid upon that soapy bar and with rather severe suddenness came to a full stop, drawing about twelve inches less water than a moment before. It took a powerful tug with a long line next day to put us in shape again.

Not so much power, however, was taken another day in this same old river higher up at the "tow head." The pilot was busily watching a white crane which one of the party aboard was going to shoot when in proper range. In the mean time the boat concluded she wanted a rest and steered slightly to starboard for a soft mud bar, into which she snugly wedged herself. Our general remedy for an ordinary "aground" was to syphon out, the leaky old hull generally having a large quantity of water in her. Syphoning failed us this time, as it had on Davy Cake; backing failed, so did rocking and backing. Next the plunder and a quantity of coal were emptied, with considerable labor, into a skiff and dugout which were in tow. Still no relief, the mud clung to the sides with vexatious tenacity. After having backed the engine, combined with rocking and pushing with the skiff oars without avail, but one remedy for our immediate relief remained. It was a cold day and the water was colder, icy cold in fact, but three gentlemen in no little discomfort had to dismantle, dismount, and by lifting on hull and backing the engine, dislodge the vessel, which was finally accomplished with much chattering of teeth. The white crane was forgotten temporarily, but he comes back to memory occasionally with a grim humor. More has happened. Some things we never tell. But we will do better with this new boat, avoiding, it is to be hoped, Davy Cake, white cranes, and all such.

Fish are as plentiful here as game. I could give truthful accounts of catches that would not be believed by the average Northern reader. Many of the lakes are inexhaustible, being annually overflowed and restocked by the Mississippi River. At this time white perch, black bass (trout here) and striped bass are biting freely in Lake Centennial. Four miles away in the swamp, three-quarters of an hour's drive, surrounded by tall timber, nestles Long Lake. Near by is Alligator; further away—seven miles—Thompson's; still further is Bricount's, and so on, all famous lakes to Vicksburgers. My string is made of lace leather, and is seventy-three inches long. Generally its whole length is not required, not even half its length; but on more than one occasion two of us have been able to completely fill it with white perch, the sweetest of our table fishes. I can take shrimp for bait and fill it most any day with bank perch of good size, and I am not considered a first-class fisherman either.

So far I have only spoken in general of this locality as a sportsman's paradise. Some of our trips would make each a letter of interesting incidents. Before the following game season closes we hope to find something of interest to detail to FOREST AND STREAM, giving something in repay for the many enjoyable things we have read in its columns. But please deliver us from the remarkable shot column. It would be a wonderful genius who could distinguish between the lies and truth in that. W. L. P.

VICKSBURG, Miss.

THE FAR NORTH.

Editor Forest and Stream:

It may interest your many readers to hear a word from the far North. I lately received a letter from my brother who was then at Fort Rae, Great Slave Lake. He is with an English gentleman who went there chiefly to hunt musk oxen, and as March is the best time of year for this, they had to winter. His letter was dated November 24, and it took some three months to reach me, coming out by the Hudson's Bay Company's winter packet. After their musk oxen hunt in spring they will descend the Mackenzie and Pells rivers, cross to the Youcan, descending it to the sea, thus making the northwest passage by land.

Great Slave Lake was frozen over as early as October 5, and many of the Hudson's Bay Company's boats were caught in the ice at different points owing to the very early season.

Deer (caribou) are very numerous there, and form, with the excellent fish with which the lake abounds, the sole subsistence of the Indians and the Hudson's Bay employees, the only inhabitants of this far-off region.

It has often struck me during my long residence in this country, chiefly in the Hudson's Bay service, and consequently seeing many out-of-the-way places, that so few gentlemen visited it with a view to hunting. Of course there would be unavoidable hardship, but they would be sure of splendid sport. One spot I remember on the north end of Great Deer Lake, or Lac Caribou, as it is called, where the caribou pass in immense numbers just at the time when the lake is setting fast. One year the fall was late and a herd of over seventy attempted to cross a large bay near the Hudson's Bay post on the thin ice; this gave way with them and consequently they all drowned and froze there, the train dogs living royally on them for the most of the winter. So plentiful were they that fall, Mr. D., the resident clerk, shot them passing his door, his wife looking over his shoulders.

Leaving Deer Lake and crossing a portage to Lake Wollaston, the tracks of large game are something to be remembered. Again on the Great Peace River, which now is beginning to attract some attention from its fertile prairies, you will hardly in the proper season pass a bend of the stream without seeing bears of all shades of color, grizzly, cinnamon and black. I have it from the highest authority that forty were counted in an hour by a boat descending the river. This stream is, alas, the last great stronghold of the beaver, who eventually, and I say it with sorrow, will be completely killed out of the country. Trappers, for the sake of his hide, and Indians both for pelt and flesh, give poor Castor no rest.

A last word about musk oxen. They are now a rare animal, and only to be found in far northern regions. They go in bands. Their robe is most beautiful, the hair being so long that it sweeps the snow. On being attacked by wolves or hunters they form themselves into a circle, placing the young ones in the center, where they are completely hid by the shaggy hides of the old ones. Their skins make beautiful robes, a warm wool under long, glossy hair. They are difficult to obtain now, however. REB.

ONE DAY OUT.

Editor Forest and Stream:

Your kind wish that I "may find time for the birds" makes me imagine that you would be glad to know that I had, and although it was but one day, its story may not be without interest. July in New Jersey was hot, and it was on one of the hottest days that I landed at—well, never mind the location—my favorite summer resort near the coast. Supper came first, and then I was ready for business. A blue shirt, a pair of trousers and a belt replaced my professional gear, and with my Parker, and a few shells in my pocket, I enter my boat and float down the river with a favoring tide. With now and then a dip of the oar to keep in channels, I float

> "By cedar-crowned bluffs and white-pebbled beaches,
> Over clean, sandy bars, through wide meadow reaches,"

now leaning over the side to watch the skurrying crabs or sight the eyes of a summer flounder as they betray his sandy hiding place; now dozing on the stern sheets puffing nicotine at the mosquitoes and watching the glories of a gorgeous sunset. Speaking of rest—well, there I find it, and amuse myself by pitying the poor fools who put on their starched chokers and waste such an evening as this in small talk around the parlor table, or in perspiring efforts on the ballroom floor. Why do men go to the country and pay high prices for the privilege of doing what they could do much more easily and comfortably at home?

But the roar of the breakers tells me I am near the sea, and as I look ahead I see a large waterfowl which I have startled dropping behind a point of sedge. Why did I bring my gun if not to shoot, and even out of practice as I am this looks like a mark I might hit. With one oar as a paddle I scull my skiff toward the screening sedges, resolved that if it is an edible bird that rises he is mine. Sure enough, and as I thought, with a flap of mighty wings a blue heron upsets my nerves, and a load from my right goes harmlessly between his dangling legs. But I think the "blue jimmy" is a good bird when the moon is big, and having overcome my ague, my left brings him to the water wing-tipped. If I was green I would row quickly to him, reach out and attempt to grasp his neck, but as I have seen his methods of using that long eel-spear which he carries forward, I prefer to dislocate its handle with a stroke of the oar before inviting him on board. It is getting dark, and leaving my craft I conclude to wait on this strip of beach to see if the moon will rise, or anything else appear to be shot at. Here on the top of a sandy knoll I find a hole that some snipe shooter has scooped for his blind. It is dry, and as I stow myself in it I find that it fits to a nicety my weary bones.

A cool breeze from the sea drives away the gnats and gives me but poor excuse for another smoke, the waves sing a restful melody, and I lie prone upon my back looking into the furthest depths of the blue sky between the stars. I count a group of them, and then go over the count to find that new ones have come. By and by I find my eyes are closing; then I wink and go to counting again. Am I dreaming? What are those cloud spots which seem to be sailing right up against the stars? The question must answer itself, but instinctively I gather my gun from across my knees and pointing it at the darkest part of the cloud mass, I pull the trigger. A whirr of wings, a shrill "quak," and the thud of a bird within a rod of my lair tells me of my success and its result. There are worse birds than a night heron when the moon is big. I wait in vain for another shot, although the bats are flitting and the sand plover whistling near me. Home, to bed and to sleep. That is all I could tell of the rest of the night. But the dawn wakes me, and a good-natured cook gives me the coffee and other trifles, which, trifles though they are, a man must have before he is worth anything in the morning.

Now for that well remembered spot where I always find a woodcock or two in July, a spring hole at the head of it and a bog crowded with alders below. It is but a few rods from the house, but I know it has been protected, and as I step under the gum trees at the spring—there, one, two, three, four, five—what do you think of that? Do you know how many men paid their car fare out to the island or to Jersey, and with a hundred dollar dog or two tramped all through the hot day over the meadows, and only got a half dozen birds or less? Well, here I have five marked down in this cripple, and although I have no dog I shall take them one at a time, and get them. And when I have done with this little place I know another not a half mile away equally as good. It is not 7 o'clock when I am back at the house ready for my regular breakfast. While I was resting in a grove after my last shot I answered the call of a Bob White in a stubble across the slough. At my second challenge he rose and came for my retreat like a bullet, striking the ground within a few feet of me, but hurriedly taking wing on finding that I was not the impudent rival he was after. A red squirrel amused me by his saucy antics until the cries of distress from a group of redwings told me that he was up to some of his old tricks, and then I stopped his kidnapping. After breakfast, an hour or two in the channels among the place,

weakfish and eels give us a good string and we row back to the house.

Now it is hot, certainly too hot to be outdoors, but when our friend offers us a buggy ride to the head of the river for a round with the doves, we are ready. Who wants to stay indoors if he can find a shady spot to do his shooting from, and this the dove meadows always afford. I will not give the details, for I remember to have given you once before a taste of this peculiar sport which affords full measure of interest without weariness. As I lay in the shade beside a running spring taking the headers and missing the side winders as often, my sympathies went out for those who, like your friend "Coahoma," have to enjoy (?) dove-shooting in an open field, without shade, where existence is only made tolerable by means of a Senegambian perambulating the field with a demijohn. And from beneath this one tree I have beaten that leading score of Captain DeGaris, fifty-three.

Now a ride back to the house. It is not sundown yet, but it is twenty-four hours since I left the cars yesterday, and twenty-four hours of such sport is enough for one day. Shall I not after a bath and tea spend the evening in a hammock, the night in sweet sleep, and go back to business in the morning more refreshed, more rested, than if I had spent a month in the tiresome routine of inactivity and fashion at the Buckingham Arms or the Hotel Pall Mall? T. B. A.

Hightstown, N. J.

THE CHOICE OF GUNS.—I.

Editor Forest and Stream:

I read with interest the article of "Medium" with the above heading in your issue of June 4, and I indorse much that he says. He truly remarks that the requisite knowledge for making judicious selection of firearms can only be acquired by experience and by reading the articles from practical sportsmen, who from time to time record their experience and observation in the columns of Forest and Stream. And in his estimate of the books which the tyro might suppose to be safe guides, I, in the main, agree with him. "Medium" says that Greener's book on the "Gun and its Development" is pretty well "padded," and is hardly fair in its criticisms of the work of other makers. In this "Medium" is certainly correct; but I will go further and say that, while the book undoubtedly contains much valuable information not easily accessible elsewhere, it contains much more that is unfair and misleading, and is by no means a safe guide to the novice in matters pertaining to firearms; that it is a huge advertisement of the guns manufactured by Mr. Greener, and the purpose of its publication was primarily and principally the extolment of these guns from beginning to end, and, when necessary to effect his object, the author has not hesitated to conceal the truth or even to make positive misrepresentations in regard to the work of other gunmakers; that other arms are considered mainly as they connect themselves directly or indirectly with the central figure, or furnish an excuse for the praise of the Greener gun, and only such space is "padded" with information about other guns as could not be more successfully devoted to pushing the author's guns in any other method. That the guns made by Mr. Greener are excellent arms, and that he is a gunmaker of repute, I am by no means the one to deny; but these very facts render the book more dangerous, for the reason that his reputation is apt to cause the uninformed to rely too implicitly upon the author's criticisms of other guns. It therefore becomes important that those who are seeking for information to enable them to form correct conclusions as to the merits of different makes of guns should first have a correct estimate of this work, so that they may not be misled thereby. I have therefore assumed the somewhat thankless task of pointing out a few of the errors and omissions of this book, not captiously or for the purpose of injuring the book or the gun it advertises, but, as I trust, impartially, and to the end that at least a tithe of that justice which Mr. Greener bestows upon his own gun may be extended to the guns of other makers, and that my brother sportsmen may see other makes of guns as they really exist, and not as Mr. Greener has seen fit to represent them.

If, on taking up Mr. Greener's book, you will, in the outset, regard it as advertisement of the guns of W. W. Greener, and regard the discussion of other guns as so much "padding" inserted to bolster up the Greener guns, you will have a true conception of the purpose of the work and will not be misled by it, but, on the contrary, will get from it much valuable information; nor, in my judgment, will you deal unfairly by this so called literary production in thus prejudging it. If, on the other hand, you take the statements of the preface as true, and regard the book as the author seeks to have you regard it—as an unbiased treatise on the gun and its development, you will be continually led into error.

It would occupy too much space to undertake to go over the whole of this large book, and I shall, therefore, only briefly notice a few of the errors and mistatements in regard to American-made guns.

I have before me the second edition of this work, which purports to be brought down to the date of publication, and (in the language of the preface) to keep step with the "continuous improvements tending to the perfectment of arms;" to "report the minutest point of progress," and to notice "every invention pertaining to guns with, the author trusts, perception and appreciation of merit wherever existent." And the preface further states that the errors of the first edition have been rectified, and that the "author has endeavored to treat of every subject fully and with fairness." This preface is dated, "Birmingham, Jan. 1, 1884."

After these statements of the preface and the frequent exhibition of superior knowledge and information found in the body of the book, the defense of ignorance can hardly be set up for this author. He professes to treat of the arms of all makers of all countries, and not exclusively of the guns made by W. W. Greener, or of the guns made at Birmingham alone, or of English arms only.

What then will the reader think of the fullness and fairness of this book, and how safe a guide will he regard it, when he is told that it does not so much as mention such guns as the Fox, the Baker, the Davis, the Remington, the Colt, the Parker, the Harrington & Richardson, and several others equally well known and in use long before the publication of this book? But it seems from certain remarks on "Machine-made Guns," beginning on page 306 of this second edition, that the product of the makers just named are not guns at all and do not come within the purview of the work of this eminent gunmaker and author. The author says:

"Among the faults of machine-made guns are: Want of proportion in the various parts, ill-shaped ribs, stocks and hammers, bad fitting of wood against iron, indifferent fitting in breech-action and locks; and in no machine-made gun that we have ever seen, of American or continental make, have the barrels been straight either inside or out. The *differentia* of machine-made machine-finished guns are: Rounded and countersunk screw and pinheads, 'gummy' stocks, weight of gun not well between the hands, and a general uncouth military musket appearance. * * * * * Machine-made guns must be considered a production of mechanical engineering, not of gun-making, and from that standpoint may give that satisfaction which from any other point of view would not be forthcoming."

The above is pretty broad language, and thus unceremoniously dismisses from consideration as unworthy further notice the most popular makes of guns in the United States. But if the author is correct and his statements true, we should submit to this wholesale denunciation of our favorites. If the statements are untrue, Mr. Greener and his book deserve severe condemnation for their insincerity.

While "comparisons are odious" and seldom establish a fact, I have this to say, and my experience is not single: I have seen a Greener gun costing more than $100 ($150 grade) that was inferior in fitting and material to any $80 Colt, Parker, Smith, Baker or Fox gun I ever saw. My observation is that American machine-made guns, so far from being as Mr. Greener describes them, are remarkable for the soundness of their material, their superior fitting, and the excellence of their workmanship; and that no foreign gun, either hand or machine-made, costing less than $75 or $100, can be found that will begin to equal American machine-made guns of the same or even a lower price in these particulars.

Mr. Greener says he has never seen a machine-made gun with straight barrels. This statement puts him in an awkward dilemma. The guns he has seen have been the work of the lower class Birmingham or German makers, or he wilfully misstates the fact. If he has not seen the better class of American machine-made guns he ought to have said so, or abstained from including American guns in his sweeping denunciation. If he has seen them he speaks what he must know to be untrue when he makes the broad assertion above referred to.

The meanest guns on the face of the earth, barring possibly one other class, are made in Birmingham—where Mr. Greener's works are located; but it would be absurd and unjust to condemn every Birmingham gun because the great bulk of the product is worthless. It is equally unjust to condemn every gun made by machinery because some English or Continental makers turn out bad ones.

But the American manufacturers produce the best machine-made guns in the world, and Mr. Greener is inexcusable in his error. He did not have the poor excuse of having been misled by seeing American machine-made guns of the character he describes. The idea of saying that such guns as Smith, Harrington & Richardson, Parker Bros., the Colt Firearms Co., and others make and sell at $50 net and upward are not guns at all, but are the vile combinations of wood and iron that Mr. Greener describes them to be, is most unjust; and when the statement comes from one so well informed as Mr. Greener, it is absolutely contemptible. No people but the Americans could have such statements as Greener makes palmed off on them for the truth.

Take, for instance, what he says when he undertakes to mention the Spenser repeating shotgun and compare it with what he says about machine-made guns in general, as a test of his sincerity. We find on page 309 this statement:

"The magazine shotgun which is shortly to be placed on the market in various calibers by the Sharps Company will have an action and magazine mechanisms similar to Fig. 152, will be a well-finished and perfectly fitted arm, but from the fact that the balance will be altered at every shot, it will not be likely to succeed well for wing-shooting."

The learned author does not know what he is talking about. The "Sharps Company" were not about to make a magazine shotgun that anybody ever heard of. The Spenser Arms Co. have made a gun of this sort, and it is a success of its kind. But this is not the point I am driving at.

The gun, Mr. Greener says, "is a well-finished and perfectly-fitted arm." But how is this? It is a machine-made gun. Are not the barrels crooked, the stocks "gummy," the fittings bad, and its appearance that of a military musket? Our author is inconsistent. If he tells the truth about the Spenser, how can his diagnosis of machine-made guns in general be correct? And if the Spenser is the perfect gun Mr. Greener says it is, how about the Colt, and the Parker, and the Smith, and the Harrington & Richardson, not to mention other more expensive guns made in part at least by machinery? Is the Spenser to be regarded as an exception to Mr. Greener's differentiation? I take it the Spenser Arms Co. will hardly claim that their gun is superior in material and workmanship to all the other American machine-made guns.

Does the solution of the mystery occur to the unsuspecting reader? Does the reader happen to remember that Mr. Greener is advertising his gun (I told you to bear this in mind), and that he does not make a repeating shotgun? Is it not possible that praise of the Spenser would not seriously affect the sale of Greener's double-barrels, while praise of other machine-made guns might? And do you notice how carefully our author has hedged off competition by the Spenser, and thus rendered his praise of that gun harmless to his own by saying the Spenser will likely prove a failure for wing-shooting—the purpose of all others for which Greener makes guns?

> For ways that are dark,
> And for tricks that are vain,
> The heathen Chinee is peculiar!

Now let us briefly see what our author has to say about American hammerless guns. On page 383 he gives what he calls a cut of an American hammerless gun, and says it is made by D. M. Lefever of Syracuse, N. Y. It is to be observed, however, that he selects for this cut not the Lefever as it had existed for half a dozen years before this edition of his book was printed, but a model that Lefever had long abandoned; and yet Mr. Greener says his book is brought down to date! The doll's-head extension of the top-rib and the bottom lug fastening described by Mr. Greener had long been abandoned by Lefever, and if Mr. Greener did not know of this he should have kept his pen from paper.

Greener's treatment is unfair, and not only in wretched taste, but in bad faith. There ought to be something like honesty and candor even between rival gunmakers. That Greener, a gunmaker and an author and presumably, at least, a reader of such papers as the Forest and Stream, was ignorant of the improvements which Lefever had made in his gun, and had used for several years and fully described in his catalogues, it is hardly fair to suppose. That he knew nothing of the compensating features of this gun no admirer of our author can fairly allege; that he failed to mention matters of so much importance is attributable to but one motive.

Lefever's first guns were made with a doll's head extension of the top rib, and with bolts locking into the bottom lugs; but his square-shouldered top-fastener had superseded these arrangements long before Mr. Greener's second edition came out. The indicating pins of Lefever's gun have been for years, at least (and so far as I know, always), placed on the lock plates; but Greener's cut represents them as being on top of the gun, where they certainly were not at the time he pretends to describe the gun. The cut Mr. Greener uses shows that the forward lug has an opening to receive the check-hook, and yet neither here nor elsewhere in the book does he mention that such a thing as a hinge-check exists or is known to gunmakers. Now, I do not think it possible for a perfect gun to exist without a device for protecting the hinge-joint from the strain of opening and closing the gun. This little hinge-check is one of the most important of recent improvements. Why does not Mr. Greener mention it? He says his book notices "every invention pertaining to guns." If I am not mistaken it had been in use ten years when his second edition was published. But it is an American invention, and it is not on Greener's gun. If he had mentioned it, the inventive ingenuity of the Greeners (father and son) would have suffered detriment; and if he had given it the meritorious place to which it is entitled, he would have experienced some difficulty in satisfactorily accounting for its absence from his gun.

The distance from the standing face of the breech to the hinge-joint is very short in the Greener gun, shorter than in any other hammerless gun I know of; that distance in the Lefever is longer than in any other hammerldss with which I am acquainted. This distance is so much leverage imparting strength. Why did not our impartial author say something on this subject?

The ball and socket hinge-joint is peculiar to the Lefever; it is one of the strongest of mechanical devices. Why did not Greener mention it?

Lefever's lock had been improved so as to make the strikers and firing pins separate, but Greener did not say so.

Lefever's outside cocking lever was very objectionable, and it was very well for Greener to condemn it; but he ought to have mentioned the many and great merits of the gun.

The Lefever is the only American hammerless gun Greener pretends to describe, and this he apparently mentions only to get an opportunity to ridicule it. He conceals its merits, but is careful to hold up its objectionable cocking lever to public gaze, and takes occasion at another place to refer to it as an "antiquated specimen." Yes, the specimen Mr. Greener fraudulently exhibits as the gun Lefever made when he wrote, is "antiquated" indeed, and had gone out of use when he wrote. To have been consistent and treated his own gun as he did Lefever's, Mr. Greener would have represented it with underguard lever, and without the extension rib fastening, which is the chief merit of his gun.

That Greener knew of the existence of other American hammerless guns is evident, for on page 385, in describing a thing which he calls the "Field gun," he says that "the locks are raised to full cock by the act of opening the gun for loading, and in a similar manner to that employed by C. E. Sneider, of Baltimore, U. S. A., in 1865. Sneider cocked his gun by a sliding rod moving diagonally in the break-off, one end pressing against an eccentric from the breech action joint pin, the other against the nose of the hammer."

This incidental mention of an "antiquated specimen" of the Sneider gun is all that he has to say about this most excellent arm, and the Harrington & Richardson, the Haskell and other American hammerless guns, are not mentioned at all, but page after page is devoted to extolling the Greener hammerless.

I do not find fault with a dealer for advertising his wares, and he may even sell his advertisements if he can fairly do so, just as many dealers do sell their large catalogues. But when a man steps out of his shop and poses as an author, he ought to try to treat the work of others fairly when he comes to describe it. He has no right to sell as an impartial treatise on firearms a book written and printed for the purpose of advertising a particular weapon; and still less has he the right to pretend to present a full and candid exposition of his subject so as to enable others to arrive at accurate conclusions, when he has never heard of, or does not mention, many of the most important of modern inventions. How shall his readers know which of all the guns is the best when the very existence of many is studiously concealed.

When he treats of American rifles, Mr. Greener is no more accurate than when dealing with our shotguns. Take, as a sample, his remarks about the Winchester—one of the best-known American repeating rifles. If all we knew about this arm was what we find in Mr. Greener's book, very few Winchester rifles could be sold. Indeed, it would be hard to get a man to take one as a gift; yet it is probable that more game is killed with the Winchester than with any other rifle, for the reason that its use is more general.

Mr. Greener says that "several models of the Winchester repeating rifle have now been manufactured," and he proceeds to enumerate as follows:

Model 1873, 440 bore, 40 gr. powder, 200 gr. lead.
Model 1876, 450 bore, 75 gr. powder, 360 gr. lead.

"A new express of 500 bore," and "their latest model, 32-cal." Now, the fact is, that the Winchester is made in only three models, viz., 1866, 1873 and 1876; and the express is a modification of the 1876 model, but it is made in various calibers, so that instead of only four, as Mr. Greener has it, there are nine distinct guns, as follows:

Model 1866, .44-cal., 28 gr. powder, 200 gr. lead.
Model 1873, .44-cal., 40 gr. powder, 200 gr. lead.
Model 1873, .38-cal., 40 gr. powder, 180 gr. lead.
Model 1873, .32-cal., 20 gr. powder, 115 gr. lead.
Model 1873, .22-cal., long and short cartridges.
Model 1876, .45-75, 75 gr. powder, 350 gr. lead.
Model 1876, .45-60, 60 gr. powder, 300 gr. lead.
Model 1876, .40-60, 62 gr. powder, 210 gr. lead.
Model 1876, .50-95, 95 gr. powder, 300 gr. lead.

Mr. Greener's book is equally behind the times and equally unfair on the subject of revolvers. On page 420 he gives a cut of the old Smith & Wesson rim fire, single action, non-ejecting pistol—another weapon that has not been made or used for years—and says: "The size is .320, and the shape will convey a relative idea of the size and appearance of the American 'six-shooter,' of which it is a fair type. The revolvers usually sold in England are .450-bore," etc. And then our author proceeds to illustrate and describe English pistols of the latest models.

When he speaks of self-extracting revolvers he shows his ill-liberality and prejudice still more clearly, and shows, too, that his mistakes do not spring from ignorance. He says on page 423 that "this principle of ejecting the cases originated, we believe, with Messrs. Smith & Wesson, of the United States, but it has been improved upon considerably both in England and Belgium. We illustrate one of the improved revolvers in Fig. 259."

Turning to the illustration on page 424, we find a pistol in which the ejecting principle is identical with that of Smith & Wesson's revolvers, except that the method of fastening the barrel and chambers to the frame (a point of superiority especially claimed by Mr. Greener) and the manner of manipulating the extracting device, are far inferior to those of the Smith & Wesson. And so far from being a "considerable improvement" on Smith & Wesson's pistol, the weapon illustrated is an inferior imitation of it.

He says, "American shot is not so regular either in shape or size as the English, and frequently there is a discrepancy between the printed list of the manufacturers and the sizes given in some leading sporting works. Tatham's list gives his size as No. 6, 218; No. 7, 291 per ounce. Thus the American No. 7 is more equal in size to our No. 6, while their No. 6 is about equal to our No. 5." Page 491.

Now the objection that "there is a discrepancy between the printed lists of the manufacturers and the sizes given in some leading sporting works," is a sensible one indeed. Are the shot makers to blame for this? It would strike the average individual that the probable reason for this "discrepancy" was the inaccuracy of the lists given in the "leading sporting works."

The fact that the same number by different makers do not correspond in size, does not affect the quality of the shot. This difference between shot of different makers exists in England just as it does in America. Nor does the fact that American shot are larger than the English shot of corresponding number affect the quality of our shot. The English makers are at perfect liberty to change the numbers of their shot to correspond with ours if the confusion bothers them.

The statement that American shot are not equal to the English has often been repeated by those who swallow every thing Greener says, and they have repeated it without taking the trouble to investigate and without knowing whether the statement was true or false, when the slightest comparison would have shown them that the statement was untrue. The shot made by Tatham; Baily, Farrell & Co., and some other American makers are "as regular in size and shape as the English," and equal to the English in every respect.

Now let us turn to his chapter on gunpowder. On page 496 we find what Mr. Greener has to say about American powder in these words:

"In the United States a large variety of powders are at the option of the sportsman. They do not, however, appear to be so clean as the English. American sportsmen may choose a grain resembling as near as possible the No. 4 Alliance for general purposes. The Orange Lightning and Laflin & Rand's (see Fig. 300) we believe to be as good as any of American make."

Now this luminous paragraph is all Mr. Greener has to say or professes to know about our black powders. It shows dense ignorance and shows clearly that he was writing at second hand without even a superficial knowledge of his subject. He speaks of the Orange powder and the Laflin & Rand powder as distinct brands, not knowing that Laflin & Rand are the makers of the Orange powder. That Laflin & Rand make good powder is not denied, but it will not be insisted that this brand is superior (grade for grade) to Dupont's, Hazard's, and several other brands. He instructs us—he permits us—to select a powder "resembling as near as possible" a certain English powder. Thanks, Mr. Greener, for your magnanimity.

The only English powder which can claim superiority to the best grades of American powder is that of Curtis & Harvey, and possibly that of Pigou, Wilks & Laurence; but these are very expensive powders—too costly for ordinary use—and I deny that they are in any wise superior to the best grades made by the Hazard and Dupont companies. Price considered, there is no powder to be had that can be compared to the American powders.

The figure 300 to which Mr. Greener refers is composed of three cuts showing different sized grains of powder, on page 405. The finest grain is marked "French," the next finest "American," and the coarsest "German." This illustration means, if it means anything, that by giving the size of the grain, an accurate idea may be had of all American powders; in other words, that we only make powder of the particular-sized grain that Mr. Greener has illustrated and labeled "American." He does not so illustrate English powder. Oh, no! his illustrations and descriptions of English powder show all the various-sized grains. His picture of "American powder" shows us the fine-grained powder once in general use, but now a thing of the past (another "antiquated specimen"). Did Greener know the Americans made powder of different-sized grains? He is like the traveler who, dining at the hotel table, saw opposite a one-eyed, red-headed Frenchman—the first and only Frenchman he had ever seen—and straightway wrote in his notebook: "Mem. The French are a most peculiar race of people; they are all one-eyed and red-headed."

But enough has been said to show how utterly unfair and inaccurate this book is on the points of most vital interest to American sportsmen, and how unsafe a guide it is to the proper selection of arms and ammunition. It does American gunmakers the grossest injustice. If it can be fairly shown that the American firearms are inferior, let it be done; but, in the name of common honesty and common decency, I protest against the fact being proved in the slipshod and disingenuous method of Mr. Greener. I protest against the suppression of truth and the suggestion of falsehood to attain a selfish end, and against comparing obsolete American models with the latest English models. Too many American sportsmen take things for granted, and on reading such stuff as Mr. Greener has perpetrated, immediately begin to decry everything American and to extol everything English as "works of art" and the like. Let the American sportsman judiciously investigate for himself and he will find that I do no injustice when I say that much which has been written on the subject by English gunmakers is mere puffing of their own wares, and that much that has been said by American writers is mere repetition, without investigation or consideration, of the remarks of these interested English authorities.

The subject of the choice of guns has been much written upon, and in these series of articles I shall not endeavor to advance original ideas, but shall endeavor impartially to survey the field in the light of what has been written by others and in view of the present state of the art of gunmaking. I shall discuss the subject in hand as fully as practicable and as fairly as possible, so that all may clearly understand me. Much will, of necessity, be said that has been written before and that the sportsman of experience already knows; but in articles of this class the statement of truisms and of elementary principles is to a certain extent necessary and unavoidable. Ah-Pe.

PREMATURE EXPLOSIONS.

Editor Forest and Stream:

I notice in your last issue a communication from C. H. Gerrish regarding the firing of the second cartridge when only one hammer fell. In the first place, there is little doubt but what the shell had a very sensitive primer, that is something we are liable to find most any day. I have fired several primers when seating them on the shell, but regarding the immediate cause of the explosion, I believe it to be the rebound of the firing pin caused by the jar of the first explosion, there being nothing to hold it still, and the heavier the strikers or firing pins the greater the blow from this cause. As an illustration I will cite a case often seen in any machine shop. When in cutting a bar of steel with cold chisel, if the chisel is not held firmly when struck with the hammer it will rebound, and striking in another place at each blow of the hammer, will cut quite deep scars on the surface of the steel, the chisel each time being struck when placed at the original mark. I do not believe any gun safe which has loose strikers, any more than I believe that hammerless guns are safe, when they have no mechanism to hold the scars in their notches, instead of simply a stop, preventing the triggers being pulled. I offer an experiment: Fire a heavy charge from one barrel while a primed shell is in the other, and see if the striker does not mark it, probably not every time alike, but leave its mark nevertheless. A. B. Dodge.

Manchester, N. H.

THE ADIRONDACK DEER.

Editor Forest and Stream:

I have wanted considerably all summer long to have a growl at you about your deer-hounding bill, and think I should feel better if I get it off my mind now. I always thought the Forest and Stream stood up for that which is just and right, or nothing. Not but what you were right in that bill, as far as it went, but there is just where the rub comes in. You did not go far enough. Why did you not include jack hunting? You could make up for the lost time by giving us fifteen more days in November for still-hunting, and I think no fair-minded man would have found any fault. But from my conversations with men around here and further in the woods, the general feeling seems to be that the bill was passed for the benefit of city sportsmen alone; and, as one man expressed it the other day, "Yes, it's all easy enough to talk about wanting to increase the number of deer and the cruelty of hounding, and all that; there may be some truth in wanting to increase the number, but they only want them for the city people to kill, and it isn't fair that the bill should be passed for city chaps alone. Why didn't they stop jacking? As for cruelty, more deer crawl away from the water to die a lingering death, perhaps only a few feet from the water's edge, while the guide and his sportsman, one from laziness the other from ignorance, rarely think of looking to see whether he was missed, or be dying or dead, perhaps only a short distance in, unless they see him drop they are apt to say, 'Guess I missed him; let's go on; we may get another further down.' Even if they do go back after marking the spot, in the morning, and find it dead, the venison ten to one is bloated and spoiled, for any who have hunted know that venison, with the entrails in, will keep but a short time even as late as October. If the law was passed for increasing the numbers or cruelty, or what not, jacking ought to have been tacked on to it. Let them still-hunt if they wish, for I don't suppose one man in a hundred can touch a deer and kill him unless there be a light snow on the ground, and let them still-hunt until say the 1st of December, then it would have been all right. Some of the city chaps might say they couldn't be here in the fall and so wouldn't have any fun. How would they like it in the quail and prairie chicken countries if we mountain people went there to spend our summers and killed the birds, male, female and young, just because we were not going to be there in the fall? If a man is keen for sport and the sport of stalking, he will come here in the season of the year when sport can be had at its best, and at the season of the year when the oxygen in the air makes one's blood tingle and leap through one's veins so that he is thankful for the mere pleasure of living. Then let a jack-hunter, be he never so weak when he comes, get into the woods and track a deer, let him match his cunning against theirs, and if he succeeds in only catching a glimpse, or better still, let him bring it down, and ask him then about jacking. As for snow, it is surely deep before the first of December, and there is surely a crust. The law is passed, however, and must be obeyed, and all we can do is to hope for the rest of the bill to be passed next winter."

I think he came near the truth, and for the future my beagles must be content to turn their attention to foxes and hares alone. I am selfishly sorry the bill passed, for I love the tingle and excitement of hearing a hound run deer, and after no other game is it quite the same feeling. But if we can't have the best, we will have to be content with what is next best, a pack of beagles running a fox, and a deerhound in lead on a runway ready to be slipped at sight.

I have had my growl and feel better. W. C. W.

Editor Forest and Stream:

A certain hotel keeper from this section of the Adirondacks stated, a few days ago, in your paper that all the men in Franklin county were mad because of the non hounding law. Now I want to contradict that statement, for I know many guides in this county who say the law is good and intend to enforce it. There are three hotels here and two of them favor the law. The other hotel keeper says he will dog deer, but he will find it up hill work. I think we have a game protector who can't be bought for fifty dollars and we will help him. I have lots of deer within a mile of my hotel, and whosoever puts a dog after them will have their dogs shot and themselves prosecuted to the extent of the law.

R. M. Shutts.

Indian Point, Chateaugay Lake, N. Y.

Editor Forest and Stream:

I have just returned from deer lands. I find by talking with hunters that they do not intend to run deer with dogs nor allow them to run. One man offered me two deer dogs if I would take them away; others want to get rid of them. I think some of them will let them go loose in order to get rid of them. Protector, District No. 10.

Remsen, N. Y., Aug. 9.

A St. Regis Lake correspondent of the Troy *Budget* writes from the Prospect House: "At breakfast you can have brook trout, also venison, but at this season of the year they call it Adirondack steak or mountain goat. Much has been said *pro* and *con* in regard to the deer hunting law. I find it very well respected by the guides and hotel keepers; but it would be very easy to evade the law, as there are but six special game protectors for a dozen large and sparsely settled counties, although some of the hotel keepers wink at the law, and you can get venison at some of the hotels under the before-mentioned names.

CANNED GOODS.

Editor Forest and Stream:

One sometimes sees a sign "Beware of the Dog" stuck up to warn off trespassers. The warning serves its purpose. But really there may be no dog there at all.

A false cry has recently been raised by parties who seem to have a purpose to serve regarding the liability of poison incurred by those partaking of canned good. Knowing that sportsmen in particular have occasion to use this class of goods probably to a greater extent than the rest of the community at large, we have carefully noted the various articles *pro* and *con* on this subject which have lately appeared in the press of this city and Brooklyn, and in our judgment the facts, as presented, fail to show any true cause for alarm.

When we consider the millions of cans of the various articles of food that are annually consumed, and also bear in mind the fact that the report even of a supposed case of poisoning from their use is a rare thing, we are forced to conclude that the danger which it has been claimed exists, owing to the preparation used in soldering of the cans, has its foundation only in the minds of some whose wish, under certain circumstances, becomes "father to the thought." We note that it is claimed that upon the occasion of a visit of a party of gentleman to a large and well-known canning establishment in this city, a workman who had just shown the process of sealing the cans was requested to open one and taste of "one of the drops inside of the can." The report goes on to say that upon doing so "his face became like a boiled lobster in color, and he was finally compelled to eject the liquid from his mouth." Now, if "a drop" of the liquid is so distasteful that one cannot retain it in the mouth, how can a person partake of a sufficient quantity of this liquid contained in a can of vegetables as to suffer poisoning?

Again, we notice it is claimed that chloride of zinc, an extreme diluted solution of which is used in the operation of sealing the cans, produces, when taken into the system, Bright's disease, and the wonderful announcement is made that this offers the solution of the question (*i. e.*, the cause of that disease) which the ablest minds in the profession, both here and abroad, have been unable to determine after many years of study and research. But opposed to this is the fact that the symptoms said to be produced from this cause are by no means conclusive evidence of the existence of the disease in question; hence, the physician who so loudly declares that canned goods in general contain chloride of zinc in poisoning amounts, although admitting the point that the amount is so small that the case becomes one of "cumulative poisoning" and thus arrives at the conclusion that he has herein discovered the cause of this disease, is, in our judgment, imposing too much upon the credulity of the general public; and we are apt to regard all such statements in the same light as we do the notice "Beware of the Dog," when there is no dog in the yard. Wendell.

Bay Bird Shooting on Cape Cod.—Of late years bay birds have been very scarce along our coasts and marshes. Where have the birds gone? I can remember when a bag of fifty or sixty in one day was not considered a big thing. I have heard of one gunner using a bag of shot in one day. Now if one shoots ten or a dozen yellowlegs it is considered good. Well do I remember my first attempt at bay bird shooting. I arrived at the Cape at noon. I could hardly wait to swallow my dinner, I was so impatient to try my luck with the birds. I shouldered my gun and decoys and started for the marsh, a mile distant. On my arrival I set out my decoys, took my place behind a tuft of high grass and waited. The first thing in the shape of game was a large flock of peeps and ringnecks, but I thought myself too much of a sportsman to fire at such small game, as I had read somewhere it was not the proper thing to do. Two hours passed and still I had seen nothing but peeps. My patience was nearly gone, and sportsmanlike or not, I determined to open on the peeps. So I emptied on them, when suddenly there dropped, as if from the clouds, five of the largest yellowlegs it had ever been my good fortune to see. My gun was empty, I was excited, I began to load, the birds lit. I poured two charges of powder into one barrel, and two of shot into the other. I rammed these down. I saw my mistake. The birds saw theirs and flew. I whistled them back and drew my charges. At last the gun was loaded all but capping. As I took the caps from my pocket the birds flew never to return, although I whistled myself hoarse hoping they might return. I waited after this about an hour, and seeing nothing more I pulled up stakes and started for home, somewhat less confident of my abilities than before I started. Thus ended my first gunning experience. I have been a good many times since then, and on some occasions have had very good success.—Yellowlegs.

The Scent of Nesting Birds.—New Westminster, British Columbia.—*Editor Forest and Stream:* I would like to know what sort of dogs Mr. R. B. Roosevelt refers to (in his article on "The Mower and the Quail" in a late issue of Forest and Stream) as used for locating the nests of quail before putting the mowers into the field. I have been using dogs for a matter of over thirty years, and I have never yet had one that could nose a sitting quail or grouse, and perhaps my experience has been confined to certain classes of dogs, which, in the matter of scent, have been inferior, but I am inclined to think otherwise. However, if there is a new class of dog which possesses such wonderful powers of scent over that of the best bred pointers and setters, I would be glad to know it.—J. C. Hughes. [We have repeatedly seen dogs point nesting grouse and quail. On certain occasions, too, we have seen the same dogs, when brought within five feet of sitting birds, pay no attention to them. It may be that in such cases when the bird is sitting very close and still on the nest, under certain weather conditions it gives out no scent.]

PHILADELPHIA NOTES.—Aug. 15.—Grass plover shooting is now very good in the interior of the State and the birds that come to our market are in splendid condition. Bay birds have been plentiful all the week on the New Jersey shores and good bags were made. The reeds on our rivers will ripen very early this season, and a big crop will offer attractions for both reed birds and rail. Many of the meadows on the Delaware and Schuylkill still remain overflowed, and numerous flocks of tell-tales are enticed thereby from the bay feeding grounds and good shooting can be had at any one of these inundated places in the early morning. As proof that a few rail birds still breed on the New Jersey creek marshes, the day after the tornado and subsequent freshet that passed over this section a week since, a nest of this bird filled with eggs was found floating in some trash in Mantua Creek, N. J.—HOMO.

BOB WHITE OR QUAIL?—*Editor Forest and Stream:* "Wells" protests against the name quail. If it is a question of resemblance I would ask if the bird does not more resemble a quail than it does Bob White. Please air my little grievance too. I wish that some of your readers would tell why it is that most Southern people persist in calling the black bass a trout. He does not resemble the trout in fins, tail, or head, and in color I am sure is dissimilar. Who ever heard of a trout having scales like a bass, or a bass with spots like a trout? A reform is necessary down South.—S.

SCOTLAND.—London, Aug. 12.—To-day is the famous 12th of August, the opening of the grouse shooting season. Probably two-thirds of the members of Parliament are in Scotland. Many left for the north last night. It is hardly respectable for any one of social eminence to be seen in London now. The prospects of sport are said to be unusually good; but it is certain that people grow more inquisitive each year about the 7,000,000 acres in Scotland alone which are devoted to the "sport of kings."

COMPANION WANTED.—*Editor Forest and Stream:* I am going to Minnesota in November duck and goose shooting, and would like to have along as companion a good rough and ready fellow, one not afraid of a wetting or a little hardship, and I promise him a surfeit of the best shooting on this continent.—CHAS. M. GRAINGER (128 Prince street, New York city).

BISMARK, Dakota.—We are to have a tournament for October, to which marksmen from every State in the Union will be invited. Game is so plentiful here that in a ride of one hour from the city last fall I saw thirteen deer and thousands of geese and ducks.—W.

UPLAND PLOVER are plenty in New England this year. We hear of a number of good days' shooting in Massachusetts and Connecticut. Who has had any experience with upland plover decoys?

FORT CUSTER, Mont., Aug. 4.—I have not been out yet to see how the crop of young sharptails is coming on, but I have been told that the birds are plenty.—B.

"SHORE BIRDS."—A 15-cent pamphlet descriptive of habits, haunts and methods of capture. Instructive, entertaining and timely. Sent from this office.

ORLANDO, Florida, Aug. 12.—Game prospects are good for next fall. Many quail have been hatched.—F. C. H.

OPEN GAME SEASONS.

Arkansas.

Deer, Sept. 1-Feb. 1. Wild turkey, Sept. 1-May 1. Pinnated grouse (prairie chicken), Sept. 1-Feb. 1. Quail (Virginia partridge), Oct. 1-March 1.

British Columbia.

Deer, elk, reindeer, caribou, hare, Sept. 1-Jan. 10. Grouse, partridge, prairie fowl, quail, snipe, robin, meadow lark, Sept. 1-Feb. 1. Wild duck, Sept. 1-March 1. Pheasant protected to Sept. 1, 1886.

Colorado.

Elk, deer, buffalo or bison, Oct. 15-Jan. 1. Mountain sheep protected to 1895. Partridge, pheasant, prairie hen, prairie chicken and grouse, Oct. 1-Nov. 15.

Connecticut.

Ruffed grouse, quail and woodcock, Oct. 1-Jan. 1. Wildfowl, Sept. 1-May 1. Rail, Sept. 12-Jan 1 (in New Haven, Fairfield and Litchfield counties, Aug. 20-Jan. 1). Game exportation forbidden.

Delaware.

Partridge, quail, pheasant, ruffed grouse, woodcock, hare, rabbit, in Kent and Sussex counties, Nov. 15-Jan. 15; in New Castle county, Nov. 15-Jan. 1. Ortolan, reedbird, rail, Sept. 1-Jan. 1. Pinnated grouse (prairie chicken) protected to 1886. Birds and rabbits may be killed by any person on his own land at any time. Non-residents must become members of the Delaware Game Protective Association, fee, $5 first year, $2 per year thereafter. Secretary, George Churchman, Wilmington, Del. License (fee $50) required to export game for market. License (fee $25) required for buying game to sell again.

Florida.

This State has no game law.

Indiana.

Ruffed grouse and quail, Oct. 15-Dec. 20. Woodcock, July 1-Jan. 1. Wildfowl, Sept. 1-April 15. Pinnated grouse, Sept. 1-Feb. 1. Wild turkey, Nov. 1-Feb. 1. Deer, Oct. 1-Jan. 1. Exportation of deer, quail, pheasant, wild duck, grouse, prairie chicken, woodcock, forbidden.

Maine.

Moose, deer and caribou, Oct. 1-Jan. 1 (forbidden to hunt with dogs), unlawful for one person to take more than one moose, two caribou or three deer in one season. Mink, beaver, sable, otter, fisher, muskrat, Oct. 15-May 1. Wood-duck, dusky, black or other sea duck, Sept. 1-May 1. Wildfowl law does not apply to seacoast. Ruffed grouse (partridge), woodcock, Sept. 1-Dec. 1. Pinnated grouse, Sept. 1-Jan. 1. Plover, Aug. 1-May 1. Woodcock and ruffed grouse may be killed only for consumption within the State. Sunday shooting forbidden. The Commissioners of Fisheries and Game are E. M. Stilwell, Bangor; H. O. Stanley, Dixfield. A digest of the laws may be had on application to them.

Manitoba.

Deer, cabri, or antelope, elk or wapiti, moose, reindeer or caribou, Oct. 1-Jan. 1. Ruffed grouse, pheasants, partridges, prairie chickens, Sept. 1-Jan. 1. Woodcock, plover, snipe, and sandpiper, Aug. 1-Jan. 1. All kinds of wild duck, sea duck, pigeon, teal, wild swan, or wild goose, except the variety of of wild goose commonly known as the snow goose or the wavy, Aug. 15-May 1. Otter, fisher or pekan, beaver, muskrat and sable, Oct. 1-May 15. Mink and marten, Nov. 1-April 15. Exportation of game forbidden.

Massachusetts.

Ruffed grouse, Sept. 1-Jan. 1. Quail, Oct. 15-Jan. 1. Woodcock, Aug. 1-Jan. 1. Wildfowl, Sept. 1-April 1. Deer, protected at all times. Squirrel, rabbit (hare), Sept. 1-March 1. Plover, snipe, sandpiper, rail, and any of the so-called marsh, beach or shore birds (except black-breasted plover, red-breasted sandpipers, chicken plover, winter yellow-legs, and Wilson's snipe), July 15-April 1. Herring gull, tern, sea swallow, mackerel gull, Aug. 1-May 1. Quail and prairie chicken may be had in possession (if lawfully killed) Jan. 1-May 1. Wildfowl specified are wood (summer) duck, black duck, teal. Massachusetts Fish and Game Protective Association, Boston.

Michigan.

Deer in Lower Peninsula, Oct. 1-Dec. 1; Upper Peninsula, Aug. 15-Nov. 15. Elk protected to 1889. Ruffed grouse, Sept. 1-Jan. 1. Quail, Nov. 1-Jan. 1. Woodcock, Aug. 1-Jan. 1. Pinnated grouse, Sept. 4-Nov. 1. Wild turkey, Oct, 1-Jan. 1. Wildfowl, Sept. 1-May 1. (Wood, mallard, teal and gray ducks, Sept. 1-Jan. 1.) Snipe, Sept. 1-May 1. Exportation of deer, ruffed grouse, quail, prairie chicken, wild turkey, forbidden.

New Brunswick.

Moose, caribou, deer, Aug. 1-Jan. 1. Mink, otter, fisher, sable, beaver, Sept. 1-May 1. Partridge, snipe, woodcock, Sept. 1-March 1.

New Hampshire.

Plover, yellow-legs, sandpipers, woodcock, ducks and rail, Aug. 1-Feb. 1. Ruffed grouse, partridge, quail, Sept. 1-Feb. 1. Deer, moose and caribou, Sept. 1-Dec. 1. Mink, beaver, sable, otter, fisher, Oct. 15-April 1. Raccoon ('coon), gray squirrel, Sept. 1-Jan. 1. Hare, rabbit, muskrat, Sept. 1-April 1. Fish and Game Commissioners: George W. Riddle, Manchester; Elliot B. Hodge, Plymouth; Luther Hayes, South Milton.

New Jersey.

Ruffed grouse and quail, Nov. 1-Jan. 1. Woodcock, July 1-Aug. 1, and Oct. 1-Dec. 16. Pinnated grouse, Oct. 15-Dec. 1. Deer, Oct. 15-Dec. 1. Rail, Sept. 1-Dec. 1. Reedbird, marsh hen, Aug. 25-Dec. 1. Upland plover, Aug. 1-Jan. 1. Summer ducks, Sept. 1-Jan. 1. Squirrels, Sept. 1-Jan. 1. Rabbit, Nov. 1-Jan. 1. Non-residents must become members of a game protective society of the State to shoot or fish within its borders. New Jersey Game and Fish Protective Society has jurisdiction over entire State. Fee, $2 annually. Secretary, Wm. L. Force, Plainfield, N. J. Or, non-residents to shoot or fish in Camden, Gloucester, Atlantic, Salem, Cumberland and Cape May counties, may obtain membership certificate of West Jersey Game Protective Society. Fee, $5 first year, $2 annually thereafter. Secretary, Wm. T. Miller, 106 Market street, Camden, N. J.

New York.

Ruffed grouse, Sept. 1-Jan. 1 (Queens and Suffolk counties, Nov. 1-Jan. 1); Columbia county, Sept. 1-Dec. 1). Quail, Nov. 1-Jan. 1 (Columbia county, Nov. 1-Dec. 1). Woodcock, Aug. 1-Jan. 1 (Oneida, Niagara, Delaware and Dutchess counties, Sept. 1-Jan. 1; Columbia county, Sept. 1-Dec. 1). Rail, meadow hen, Sept. 1-Jan. 1 (Columbia county, Sept. 1-Dec. 1). Wildfowl, Sept. 1-May 1 (Long Island waters, Oct. 1-May 1). Robin, meadow lark, starling, Oct. 1-Jan. 1). Bay snipe, sandpiper, shore bird, plover, July 10-Jan. 1. Rabbit, hare, Nov. 1-Feb. 1. Squirrel, Aug. 1-Feb. 1 (Dutchess county, Sept. 1-Feb. 1). Deer, Aug. 1-Dec. 1; hounding forbidden at all times (except in Suffolk county, Oct. 1-10). Marketing game forbidden, Dutchess, Rockland, Columbia, Niagara counties. Non-resident license fee ($10) in Richmond county (Staten Island).

Pennsylvania.

Ruffed and pinnated grouse, Oct. 1-Jan. 1. Quail, Oct. 15-Jan. 1. Woodcock, July 4-Jan. 1. Wildfowl, Sept. 1-Jan. 1; on Mondays, Wednesdays and Fridays of each week only. Wild turkey, Oct. 15-Jan. 1. Deer and elk, Oct. 1-Dec. 15; transportation allowed only Oct. 1-Nov. 30; forbidden to kill fawn in spotted coat, or to pursue or kill elk or deer in the water, or to chase them with dogs. Plover, July 15-Jan 1. Rabbit (hare) Nov. 1-Jan. 1. Squirrels, Sept. 1-Jan. 1. Rail and reedbird, Sept. 1-Dec. 1. *Pike County:* Deer, Oct. 1-Dec. 1; cannot be killed in the water. Squirrel, Sept. 1-Dec. 15. Rabbit, Oct. 15-Dec. 15. Wood or summer duck, Oct. 1-Jan. 1. Woodcock, July 4-Dec. 15. Quail, Oct. 15-Dec. 1. Ruffed grouse, Sept. 15-Dec. 15.

Quebec.

Moose and deer, Sept. 1-Feb. 1. (female moose may not be killed before Oct. 15, 1888). Caribou, Sept. 1-March 1. Non-residents (except with permit) forbidden to take in one season more than 2 moose, 3 deer, or 2 caribou. Beaver, mink, otter, marten or pekan, Nov. 1-April 1. Hare, Sept. 1-March 1. Muskrat (in Maskinonge, Yamaska, Richelieu and Berthier counties), April 1-May 1. Woodcock, partridge and snipe, Sept. 1-Feb. 1. Black duck, teal and wild duck of any kind, Sept. 1-May 1. Migratory quail protected to Dec. 31, 1886. *Non-residents.*—"No person who is not domiciled in the province of Quebec nor in that of Ontario, can at any time hunt in this province . . . without being authorized thereto by license to that effect. Such permit may, on payment of a fee of twenty dollars, be granted by the Commissioner of Crown Lands to any person . . . and is valid for a whole shooting season." Permits may also be granted to non-residents to take specimens for scientific purposes.

Texas.

Deer, June 1-Dec. 1. Wild turkey, Sept. 15-May 15. Ruffed grouse, July 31-March 1. Quail, Sept. 1-March 1.

Vermont.

Deer protected to 1890. Quail, ruffed grouse, Sept. 1-Feb. 1. Woodcock, Aug. 15-Feb. 1. Wild geese and ducks, Sept. 1-May 1. Exportation forbidden.

Washington Territory.

Deer, elk, moose, mountain sheep, Aug. 15-Jan. 1. Wildfowl, Aug. 15-April 1. Prairie chicken, sage hen, Aug. 15-Jan. 1. Grouse, pheasant, quail or partridge, Aug. 1-Jan. 1.

[TO BE CONTINUED.]

Camp Fire Flickerings.

"That reminds me."

161.

MY father had just returned from trout fishing, and around the crown of his hat was wound his leader, allowing the three flies to hang loose. As he entered the house he laid his hat upon the table. Presently my aunt entered the room and espied a peculiar fly upon the hat. She approached her game cautiously, drew back her hand, and made a tremendous swoop upon her prey. She had well calculated the distance, but instead of catching the fly the hook entered her little finger, and a small surgical operation had to be performed before the yellow professor could be released. W.

162.

Naushon Island is owned by a wealthy gentleman from Boston, who keeps it well stocked with deer and raises many sheep. The island being large, it is hard to watch, and considerable injury is done by summer fishermen, who land and help themselves. It has always been the desire of the old gentleman to detect and punish one of the offenders as an example to the others; but he has never been successful, though how near he came to it may be seen from the following: This gentleman has a son who is fond of yachting, and at one time being in a small harbor where several fishermen were anchored, he proceeded in a boat with several friends to a fishing vessel to try and obtain some fish. While there, having plenty of time to spare, they started a series of stories, each person telling one. At last, each having told his story with the exception of one, this person, who did not recognize his guest, began in rather a confused way. "Wal, talk about yer hard times, I calkerlate we had the derndest time down thar to Tarpaulin Cove that I ever saw. We got blowed in thar in a nor'easter and our food give out. Wal, we got kinder hungry, an' so I sez, sez I, 'They keeps a lot er sheep up yonder, let's go up an' catch one.' 'All right,' sez Bill. An' we went up thar an' jest whooped round them pastures arter them sheep. Wal, at last I got a fat little one cornered, an' I jest grabbed him by the throat an' hauled out my knife an'—" Just then one of the other fishermen, probably Bill, who seemed to know the owner of the yacht and understood his intentions—for there he sat all alert, expecting that the man would convict himself—gave the narrator an expressive look which was immediately understood, for the man continued, "an'—an'—I was jest going to strike, when derned if that sheep didn't give me such a piteous look that I couldn't strike, but jest let him go." The laugh that went up proved plainly that the true state of things was understood all round, and it was seen that Mr. F. was again outwitted. T.

163.

Here is a flickering for you. Two Chenango county sportsmen were out after foxes. They had shot one and heard the hounds coming their way with another. They laid their fox down, but the hounds did not bring the other near enough for a shot, and imagine their feelings when they turned to pick up their supposed dead fox to see him running about forty rods from them. B.

COVENTRY, N. Y.

164.

Barnard Stough (commonly called Barney by his neighbors) of Cumberland county, Pa., owned a farm along the Yellow Breeches Creek. He had a trout pond on his farm well stocked with trout, and when he wanted a mess could catch them at any time. Barney was the leading member of a sect called the River Brethren, an offshoot of the Dunkards, and he wore a large, full beard, and preached for the congregation in that section. One Sunday after preaching (the services were held in the barn), he thought a mess of trout would taste good for supper. So digging some worms and taking his rod he went to the pond and caught a number, took them home and ate them for supper. Some of his congregation or brethren saw him fishing on Sunday, and reported him to the church committee. He was made to appear before them. All the brethern spoke Pennsylvania Dutch, and the examination was in that language. The question was put to Barney, "Did you fish on Sunday?" "Ja, ich hab g'fischt, und sie hen gut g'bisse; sie hen au gut gesse, und wan sell eich net suit, dann hau ihr an anere prediger griege, ich predig anyhow for nix," meaning, "Yes, I did fish and they bit good, and they ate good, and when you don't like it then you better get another preacher. I preach for nothing, anyhow." The case was dismissed, defendant discharged; and Barney still conducted the exercises until he died a few years ago. A.

THE "RAZOR-BACK" OF GOGEBIC.

I HAVE recently returned from a visit to Gogebic Lake and the Eagle Waters of the Upper Peninsula of Michigan. The black bass fishing of Gogebic, the trout fishing of Watersmeet, and the muscalonge and pike fishing of Eagle Waters have not been overdrawn in the seemingly extravagant statements that have, for the past two years, excited the astonishment and aroused the disgust of all genuine anglers, for while the greedy bait or spoon fisher can fairly revel in piscine slaughter, if so disposed, the honest fly-fisher is assured of excellent sport.

The morning after my arrival I saw two large piles of black bass burnt at the edge of the lake, but a little quiet and judicious missionary work, by precept and example, on the part of Mr. Dawson, of Cincinnati; Drs. Ferber and Trowbridge, of New York; Mr. B. B. Allen, of Nashville; and myself seemed to convince the erring brothers of the angle that it was more in accordance with the *esprit de corps* of the guide to return to their native element, unharmed, all lightly-hooked fish, than to bring them in by the boat load to gratify a morbid sense of approbation or a foolish love of display, and I am happy to say that the offense was not repeated during my stay.

The object of my visit was not so much to fish as to determine the identity of the so-called "razor-back" of Gogebic and the muscalonge of Eagle Waters. I found the razor-back to be merely the small-mouthed black bass in a very emaciated condition, and, as a result, with the dorsal outline very thin or sharp. They were of all sizes, from a half to three pounds in weight. They were not very numerous, but enough were taken to excite remark, and to favor the opinion that they were an undescribed species of black bass, especially as they exhibited all the gameness of their plumper congeners. I found the cause of the emaciation to be tape-worm (*Tænia*). Every razor-back dissected was inhabited by one or more tape-worms, not always confined to the intestinal tract, but often roaming about at their own sweet will in the abdominal cavity. (In order that an unwarranted prejudice may not be aroused against the black bass on this account, I might remark, *en passant*, that every species of fish is subject to tape-worms and other vermicular parasites, and many food fishes to a greater extent than the black bass).

As before remarked, the razor-back was exceptional among the small-mouthed bass, as most of this species were in good or ordinary condition, while the large-mouthed bass were all very plump and fat, no "razor-back" appearing among them. They were, moreover, equal to the small-mouthed bass in gameness, and as a rule broke water oftener, and by some

were thought to be the gamest species, but I could perceive no difference in this respect.

It has been asserted by some and denied by others that the muscalonge inhabits the Eagle Waters, as the numerous lakes and "thoroughfares" at the head of Eagle and Wisconsin rivers are called. It has been stated that the fish so-called was but an overgrown pike or pickerel (*Esox lucius*), but the true muscalonge (*Esox nobilior*) has a local habitation if not a name in these waters. I have a specimen of six pounds, and the head of one that weighed thirty-eight pounds. They are muscalonge without the shadow of a doubt. Both of my specimens show eighteen branchiostegal rays, have the lower half of both cheeks and gill covers naked, or bare of scales, and have 150 scales along the lateral line. They differ from the muscalonge of the St. Lawrence only in coloration, not being black-spotted like the latter, but of a uniform grayish coloration, darker along the back and whitish on the belly. It is, in my opinion, the same fish that inhabits the Upper Mississippi, and a few rivers of eastern Kentucky emptying into the Ohio above Mayville, and I am very desirous to see specimens from these localities.

The pike or great Northern pickerel (*E. lucius*) and the pike-perch (*S. vitreum*) also exist abundantly in Eagle Waters, and do not differ from those of other waters except in being a little duskier in color, owing to the darker water. The black bass of Gogebic are also very dusky from the same cause. Neither the pike nor the pike-perch are found in Gogebic, but the streams emptying into the lake are fairly stocked with brook trout.

The month of September is about the best in the year for muscalonge fishing in Eagle Waters, or for fly-fishing for black bass in Gogebic Lake. I can recommend both localities to the notice of anglers. The season for deer is also open at that time at Gogebic (but not for Wisconsin), and they are quite plentiful. Ruffed grouse are abundant about the lake, and also a few spruce partridges. Messrs. Arnold & Tarbell, proprietors of the hotel at Gogebic, Mich., and Mr. A. A. Denton, of the Denton House, Eagle River, Wis., will cheerfully reply to all inquirers. Mr. Fred French, of the latter place, is an excellent guide and perfectly reliable.

James A. Henshall.

Cynthiana, Ky., August, 1885.

ROD AND REEL ASSOCIATION.

A MEETING of the Association was held in Mr. Blackford's laboratory, Fulton Market, Aug. 11, at 3 P. M., President Endicott in the chair. It was decided to hold the next tournament on Tuesday and Wednesday, Oct. 13 and 14, and that all prizes must be delivered to Mr. E. G. Blackford on or before Oct. 1, in order that the prize list may be mailed to members in time. A committee of arrangements consisting of twenty-six members, of which Hon. Henry P. McGown is chairman, was appointed. This committee then went into session and the following sub-committees were appointed: On grounds, Martin B. Brown, Francis Endicott and H. P. McGown; on rules, Francis Endicott, Samuel M. Blatchford and Fred Mather; on prizes, E. G. Blackford, Henry P. Wells and C. Van Brunt.

It was recommended that any member who may have suggestions to make regarding the rules, to make them in writing to the chairman of the committee on rules.

The following is the committee of arrangements: Hon. Henry P. McGown, chairman; James Benkard, E. G. Blackford, S. M. Blatchford, Dr. E. Bradley, Martin B. Brown, Henry F. Crosby, D W. Cross, Francis Endicott (President, *ex officio*), Chas. B. Evarts, James Geddes, W. C. Harris, Dr. J. A. Henshall, Thatcher Magoun, Chas. H. Mallory, J. C. McAndrew, Hon. Robert B. Roosevelt, Isaac Townsend, James L. Vallotton, J. S. Van Cleef, C. Van Brunt, Henry P. Wells, Edward Weston, Col. Locke W. Winchester, Louis B. Wright and Rev. Henry L. Ziegenfuss. Communications may be addressed to the Secretary, Mr. Fred Mather, Cold Spring Harbor, N. Y.

THE BAREFOOT AGAIN.

Editor Forest and Stream:

Under the head "The Most Killing Fly," I have seen many articles lately in Forest and Stream, and read with pleasure "Sport's" opinions in the issue of June 4. To me, a young beginner coached by an old trout fisherman, it does appear strange to hear so much talk of flies, and see my old friend always taking a quantity of trout with nothing but the common worm. Further than this, I often see lengthy and pithy articles on this royal sport, wherein it appears that only about a dozen, often less, completes the day's catch, and our city sportsman, with his expensive rod, reel, lines and leaders, does not take nearly so many trout as my old friend Adon with his home-made tackle. Furthermore, our city sportsman will go many many miles to catch what few he gets, when here right close to Philadelphia, there are three streams that I know of, well stocked with trout, and probably will be until the railroad runs a little closer than it now does to them.

Only yesterday Adon and I took a grist to the mill to be ground, and while they were grinding it we tied our hooks to a three-foot line without leaders or even catgut, and cutting sticks about four feet in length, dawdled down to the stream and commenced, baiting with ordinary worms. On the very first cast I hooked a fine trout, and by the time the miller shouted that the grist was done we had caught exactly a dozen, and had I been as expert as my friend, would have had two dozen, but I am young at it yet and only took four out of about twenty rises. On my return to Philadelphia this morning I took them into John Wirth's gun store and found that the dozen weighed exactly three pounds and three ounces.

Now, taking all things into consideration, viz., catfish hooks, no leaders or guts, no fancy rods, worm bait, and only a couple of hours' time spent at the stream, and at the outside only a half mile of the stream traversed, it does appear to me that if one of our literary sports could fish there one day with good tackle, he ought to have enough sport to write an article three columns long. Outside of the sport in seeing the trout take the fly, I thoroughly enjoyed the time spent on the banks of the stream, whose waters, so cool and refreshing, run so swiftly, and to a lover of nature make such sweet music rushing over the pebbly bottom. Therefore I say, let our city cousins look around nearer home. There is trouting to be had, and good at that, without going so far to so little purpose; and also let them examine for themselves whether the country sport with home-made tackle does not take more fish than themselves, who are so good in theory but poor in practice.

It is the same in shooting. The city sport has his D. B. hammerless gun and finely bred setters with records as long as your arm, gets little game, but invariably the countryman, with his old single muzzleloader and what they would call our dog, gets all the game it is comfortable to tote around. B.

[Our correspondent is sadly in need of a missionary to teach him that the mere killing of fish is not the end of angling. If he had used a seine he might have increased his catch and saved time. If he will cut loose from his tutor and learn to take a trout with a fly he will learn what trout were made for. As he has some of the elements of a sportsman in him there is hope of his emerging from his benighted pot-fishing state under proper instruction.]

GOGEBIC, ONTONAGON AND EAGLE.

PERSISTENTLY for three weeks during the pleasant month of September, 1884, the writer struggled heroically in vain efforts to call from their damp depths a few, only a few, of the trout of the Rangeley Lakes. A hundred flies in succession dangled from the filmy leader and went dancing merrily over the foamy waters below the Middle and Upper Dams. At sunrise, sunset, and even at high noon the good work went on incessantly and vigorously, but all to very little purpose. During the entire three weeks scarcely a dozen fish came to hook, of which two were reminders of the good old days of yore—big, brave and brawny fighters—of the good old days when every hour at the glorious pool below the Upper Dam the angler was sure of a five-pounder. Alas, those good old days have gone and the big trout of those peerless waters are fast disappearing. It is useless to conjecture, the facts are manifest, and the tourists and anglers who continually send glowing accounts and big records anent these waters to the press are simply spectacular raconteurs or mayhap have met with accidental luck.

When a man "chucks bugs" constantly and resolutely for three weeks, exhausts an extensive fly-book, wears out his leaders, tires his arm, and gets but a dozen infantile rises he sort of hankers after inclement language and naturally turns his thoughts to fresh fields and new waters. Many a time and oft during years gone by the writer has safely passed through innumerable heroic struggles with the tinted monarchs of these beautiful waters, and it grieves him to part with his favorite fishing ground, but in the face of previous ill-luck he gave them another trial this spring with the same result—exceedingly poor fishing all round. But "sufficient for the day" is all a man wants, and so, early in July, the scribe packed up his duds and hied him hence into the northwest to drop a lure on the waters near the father of fresh-water lakes—Superior.

Lake Gogebic lies in Ontonagon county, in the peninsula of Michigan, three hundred miles north of Milwaukee and some fifteen miles from Lake Superior. It is surrounded by a vast pine wilderness, is eighteen miles long by an average width of two miles, has a mean depth of about fifteen feet of clear, bluish water, and unquestionably affords the best black bass fishing in America. Last summer these waters were invaded by the angler for the first time, and the lake was found overstocked with fish that were chronically hungry. Since then tons of bass have been gathered in, or rather gathered out, yet they seem as numerous as ever—"thick as leaves in Valambrosa," as it were. On July 19 the scribe took 165 small-mouth bass, returning thirty-five to the water as being under weight—a pound and a half being the limit—while the balance were brought to the hotel to be cooked and devoured by some sixty angling guests. Of these, thirty-five weighed over three pounds each. The lures for these fish were minnows, worms and pieces of white flesh cut from the fish. They were all taken without moving 100 yards from our first anchorage. Another day's labor brought 125 fish, and an hour's fly-casting at evening resulted in seven fine bass, one weighing nearly five pounds, and a brook trout of half a pound, a few of these inhabiting the lake. Fishing in Gogebic will be good for years to come, and the location will be popular because it is easy of access, has excellent hotel accommodations at moderate prices, plenty of good boats and boatmen, and the fish are voracious and pretty much always on the bite. The hotel and its six adjoining cottages stand in the only clearing on the lake and are the only buildings within miles.

Small and large-mouth bass inhabit these waters, the former predominating as about ten to one, while an occasional specimen of an exceedingly thin species of the small-mouth is taken, locally known as the "razor-back." I took one of these with the anatomy of a three-pound fish that weighed but little more than a pound, and who fought like a tiger. This fish was submitted to my friend Dr. Henshall, who was on the ground just pulverizing the *Micropterus*, and on dissection its extraordinary condition was found to be due to a well-developed tape-worm. So the secret of the "razor-back" is a secret no longer.

There are several fine brooks emptying into Lake Gogebic, where lovers of trout fishing can gratify their desires to their hearts' content. One evening a gentlemen from Nashville, Mr. Ben B. Allen, brought in a splendid creel of trout weighing up to two pounds each, all taken with diminutive flies in a brook but a short distance from the hotel. Mr. Allen, *en passant*, is a most enthusiastic and successful angler, and the writer hopes to meet him again where the festive mosquito meandereth.

The atmosphere at Gogebic is deliciously cool, and during July when the city thermometer dallied about ninety, we at Gogebic were sleeping deliciously under a pair of woolen blankets, and to enhance our comfort not a mosquito nor fly was seen.

Ten days were delightfully fished away here, when the Ontonagon River, some twenty miles distant, and one of the grandest trout streams in the country, became our vantage ground. Three days were spent on this lovely stream, while one day's work resulted in 226 trout weighing 84 pounds, the largest reaching two pounds, and all taken with hackles, gnats and coachmen. Watersmeet is the railway station from which the Ontonagon is scarcely half a mile distant, and a good supply of mosquito food is requisite in fishing this stream. The gunner will, in the season, find this a grand country for deer, as in one day no less than nine came in view. Less than two hours' journey in the cars, during which the tourist passes through a wilderness of lakes and streams teeming with game fish, brings us to Eagle River, the center of the chain of thirty lakes known as Eagle Waters, and which, for good fishing, cannot be surpassed on the continent.

Black bass, pike and pickerel abound in great plenty, while the noble muskallonge is found in every lake in the chain. The writer has taken the lusty trout in many waters of Europe and America, and has landed big fish and little of every species, but never until the month of July just passed has he fondled the festive muskallonge; and he is now quite ready to confess that half his life has been wasted. Old *Esox nobilior* is a "war horse from way back, a yard wide and all wool," as the "thoroughbreds" of Texas are denoted. I had a 12-ounce split-bamboo rod, 75 yards E size oiled silk line, No. 4 Frankfort reel and No. 8 Skinner spoon, and on this light tackle struck a 36-pounder. *Nobilior* went into the air like a shot, and just filled the sky plumb full of fish; then dropping into the water he made it boil like a geyser. He pulled like a yoke of oxen, and it required all my strength to hold up my end. After an hour's hard work, the boat continually moving, he came to gaff, the gamest, grandest fish that ever fell to my rod, and the monument he deserves should have inscribed upon it—

"The noblest Roman of them all,"

We labored in nine lakes of the Eagle Chain, taking many fish, among them seven muskallonge averaging twelve pounds in weight, and each made a tremendous struggle for liberty. On a lovely point in Long Lake, a log camp has been built by a hunter named Blodgett, where accommodations can be had, and Fred French and Horace Foster, who live at Eagle River, Wis., will afford good satisfaction as guides. The fishing grounds named herein are all on the line of the Milwaukee, Lake Shore & Western Railway. Leaving Milwaukee at midnight, Eagle River is reached about noon, and Lake Gogebic about 4 P. M. of the day following.

Kit Clarke.

Planting Ground Lake, Wis., July 30, 1885.

THE TROUT STREAMS OF KLAMATH.

WE are on Klamath Indian Agency, Oregon, nestled at the foot of the Cascade range of mountains, and surrounded by some of the finest rivers, lakes and mountain streams to be found anywhere. Dense forests of pine, fir and hemlock cover the mountain sides and fringe the banks of the streams, which come rushing down from their lofty home, through deep, dark cañons, to wind their way over a broad, marshy tract to their resting place in the placid waters of Klamath Lake. This whole region is full of beautiful springs, which suddenly burst from some rocky ledge or mountain crest and hasten to join their many companions winding all through the woodland.

Williamson River, rising in Klamath Marsh and flowing south and west through deep gorges, forming cascades and falls of rare beauty, along with its many tributaries, is the home of various kinds of trout. Spring Creek, one of these tributaries, rising from a number of springs at the foot of a lofty ridge, and rushing and foaming over its rocky bed, its banks fringed with willows and aspen, is the fisherman's paradise. It broods the finest and gamiest variety of speckled trout, and many a time have its fair banks been pressed by the foot of the wary angler. In its romantic forest home it lies like a "thing of beauty and a joy forever" to him who, laying aside for a time the cares and responsibilities of a busy world, betakes himself to its inviting scenes to revel in a feast of nature's wildest beauty and art's rarest sport.

It was the evening of a pleasant day of the early summer that in company with our friend and fellow-fisherman, Will N., we took an excursion to these fruitful fields. After the labors of the day, as the sun was going down behind the purple mountains into its bed of scarlet and crimson and gold, mounted on our fleet Indian ponies we started for an evening's and morning's fish to the riffles of Williamson River. Our way leads over a trail a distance of six miles, among the dark pines and through underbrush of wild plum and cherry. We soon reach our destination. The evening is calm, the waters clear and cool; the trout are feeding. Our fishing tackle, an eight-ounce lancewood rod with simple click reel and medium-sized enameled silk line, is soon put together. The query comes, what fly will they take? From some knowledge of their preferences we pick out a turkey wing, and fastening to a six-foot gut leader, throw it out about forty feet into the stream. What! so soon, the first cast, and the waters break around the skimming fly. Zipp, splash, whoop, and the line glides along our fingers and sends the reel spinning. No stop or drag for us. Let the fingers of the same hand which grasps the pole be the sure index to measure the amount of tension that is needed. Now, the first sudden surprise ended, our helpless victim becomes a passive subject, and we slowly entice him to the shore. But no; stop, he thinks, as he sees himself drawn to a certain death. Whoop! and his pink and speckled sides gleam in the sunlight, and a rainbow follows his airy track. He whirls into his watery home, only again to be ruthlessly guided to an inevitable death. Such gamy qualities, such heroic struggles, such fruitless efforts. Soon the mossy banks are his winding sheet, and in the quiet evening air his life goes out. One being rejoicing over the death of an inferior. Happy man, poor fish. But no sermonizing here; we are fishing.

The same fly again drops on the water and glides to the shore. No sign. The third time it skims the eddying stream. Whoop! and eight pounds of dashing beauty grasps and carries off the tempting fly. The waters boil and rave, the rod trembles, the line is drawn to its utmost tension, the reel plays a hasty retreat. All is excitement and expectancy. The skill of the angler is taxed to successfully manage and land such a trophy. It requires coolness, patience, tact and judgment. But having met the same foe before, it is simply a question of time when he lies powerless at our feet. Thus all through the evening the same exciting sport continues. Only as the shades gather the turkey wing is replaced by the wood duck or brown hackle with yellow body. How pleasant the scenes. The sun has gone down behind the low distant range beyond the snowy peak of Mt. Pitt. Only the lofty peaks gleam coldly in his last rays. All life is hushing into the quiet repose of dreamland. Oh, such a picture! What thoughts crowd upon us. The arching sky above, the glooming mountains beyond, the primeval woodland all about, the peaceful rest and silent reign of all nature. The spirit is awed with the terrible stillness, the awful grandeur and the enchanting view. The blinking stars call us to repose. Where shall we rest? No friendly habitation is near. The cold, pitiless sky must be our only covering. One lone blanket serves as a bed; darkness is upon us, and in the frosty air our couch is made. Slumber is disturbed by dreams of breaking waters, skimming fly and exciting chase. As the first faint streak of morning dawn flushes the eastern sky, the M. D. thinks of the sport of the previous evening, and can rest no longer, but starts for the water's edge. Will, not content with the night's rest, hopes to still obtain a good nap. But soon the loud familiar whoop of mingled joy and victory breaks upon his ears. He cannot stand this. He knows there is fun on hand, and hurriedly with toilet only half made, comes rushing to the river bank.

The air is frosty and ice forms on line and pole, fingers are numbed and throbbing with pain, but there is no time to

stop, the same continued round of success follows, until the sunlight streams over the mountain tops and throws its dazzling glare upon the waters. The fish retire to their secluded nooks and we prepare for our journey home. Our score was ninety of the finest trout, aggregating 178 pounds. We had fished by actual measurement of the time three hours and forty-five minutes.

We had not come prepared for such a load, and how were we to get them home? Our ponies had got away during the night and we were alone in the wilderness. By good luck we fell upon a dilapidated old cart which Will declared had been left out of the Ark and drifted to these shores, and as the waters subsided had stranded here on the mountains. With a pair of Indian ponies not much larger than jack rabbits, and so poor that their ribs showed so plainly that they looked as if they had swallowed a pair of hoopskirts, and a pair of harness borrowed of a noble red man of the forest, we managed to rig up an outfit which carried us safely home. After dividing with all our friends there was a wheelbarrowful still left, which was donated to the Indian boarding school, gladdening the hearts of the fair Indian lads and lasses. We would not have any of your readers take us for "trout fiends," for we only catch in such quantities as can be put to a legitimate use.

Should any of the readers of the FOREST AND STREAM visit this coast and find time to take a trip to Klamath Agency, your correspondent will be pleased to lead them to trout waters where they can have all the fishing they wish. Our mountains and forests are plentifully supplied with deer and other wild game, and there is no lack of sport in the hunting line. FLY HOOK BILL.

KLAMATH AGENCY, Oregon.

THE MENHADEN QUESTION.

Editor Forest and Stream:

It is claimed that all food fish are as plentiful now as they were before trap and purse seining were known. None but interested parties would think of making such a statement, certainly no hook fisherman would do so; for example, I will take the question of striped bass and give my experience of the past fifty years, confining myself as before, to the familiar ground of Westport Harbor and vicinity, which includes five or six miles of coast east and west of the Harbor, of the very best bass ground to be found. Fifty years ago bass were as plenty and as common as other food fish, and no more sought after. They could be seen all along the channel of the river and along the ocean beach by hundreds. It was common for one man to catch more bass in a day than have been caught at the Harbor in the last two years. Then we could get menhaden by sailing a mile or two, and to get menhaden bait assured us all the bass we wanted; now it is almost impossible to get the bait, and when we do, we find there are not any fish. In 1883 I fished away four and one-half pounds of menhaden, fishing the most of July and August, and did not catch a bass.

Mr. Church says the home of the bass is between Brenton's Reef and Seaconnet Point, and that he has yet to learn that bass leave the coast to go up the river. He could easily learn if he chose, that bass are caught above the city of Taunton, in the very river he referred to, thirty miles or more from their home. So far from bass being confined to the coast, there are not any large fish that explore every river, inlet and creek as bass do.

The first place they were caught in the spring at Westport was near the head of the river, where the channel was thirty feet wide and the water eight feet deep. I have often caught twenty or thirty in an hour or two trolling an eel. They made their appearance early in April and remained until the middle of November; there were but few days when none could be caught; large bass could often be seen on the flat ground, where there was scarcely water to cover them, following their food. Two miles west of the Harbor there is a large pond of fresh water drained by a creek, occasionally opened to the ocean, through which the bass enter the pond. In winter they have been taken from under the ice, frozen, in large numbers.

Bass are very timid; at the least alarm they are off like a dart. If on the seining ground when work commenced they would immediately leave. I think it would be a difficult matter to inclose one in a purse seine; I have never known of one being taken in this way, although they have been plentiful at the time of seining. I have known the fishing at the Harbor to be suddenly broken up for several days at a time by setting a shore seine around them just once, those not caught were frightened away. Formerly seines were set only along a clear beach and hauled to the shore, now a seine made of small linen twine is set anywhere among the rocks, so that both arms rest on the shore, then by throwing a few stones within the seine, every fish is frightened off shore, strikes the net, becomes entangled, and is caught without gilling.

That bass do not, or that they cannot, feed on menhaden, because they have not any teeth to masticate their food, is simply nonsense. I think but few fish (except bottom fish that feed on mussels) masticate their food whether they have teeth or not. Any one who has had his finger in the mouth of a bluefish will never doubt their being well supplied with teeth, and they do not masticate their food, for they are always filled with whole fish of whatever kind they are feeding when caught, whether large or small. Codfish will take most anything in motion, without much regard to its size, and they have not any teeth. I have known of three coots being taken from the stomach of a codfish; two coots are often found in one fish; the ducks feed on mussels at the bottom, and when diving are easily caught by the fish. All fish appear to digest their food rapidly. Last fall we took from a bass a tautog weighing two pounds, from another a head of a tautog as large as a man's fist, besides several large crabs; the latter bass weighed but sixteen pounds, not a large fish. There was a bass caught with a pitch fork up the river, with a large menhaden wedged in its gills, and it was supposed that the bass attempted to swallow the menhaden, not the menhaden the bass. A bass that will weigh three pounds will take a mullet eight inches long as readily as a larger bass.

I am glad to agree with your correspondent in one thing, that bass do not depend on menhaden for food or man on bass; if they did both would soon starve. In Mr. Blackford's office can be seen an iron bolt two inches long and one-quarter of an inch thick, with the nut on it, that was taken from a bass. I think a fish that would raid a hardware store for food could get away with a menhaden.

The largest haul of bass taken in a seine in the last twenty years was made by first throwing several barrels of menhaden along the surf, and in a few hours setting the seine around them. The first man I ever saw fish with a rod and reel at Westport Harbor was a Mr. Lutze, from New York, not unknown to the fishermen of that day. He had the place all to himself for several years, and kept it very private, and he pronounced it the best fishing he had found. One fall after Mr. Lutze had returned to the city, a man that he had employed informed ex-Mayor Gunther of the place. He with some friends came to the Harbor, found good fishing, told others, and every season since there have been more or less gentlemen from New York at the Harbor, and all agree that fewer fish were caught last season than ever before. I talked with gentlemen from No Man's Land, Pasque, Cuttyhunk, West Island, Narragansett Pier and Block Island, and every one came to the same conclusion, that it was the poorest bass season ever known. The decline has been steady and gradual from year to year. I do not think that purse seining has been the sole cause of destroying the fishing. I am confident it has contributed largely to it by driving off the bait. The best fishing in the fall was when the young menhaden came down the river to go out to sea, which they did every fall in great quantities, as long as any large ones were suffered to reach the river in spring. Traps are set all along the coast and in the inland waters, and seining in all rivers where bass go to spawn, until they are nearly driven from the coast. It is a wonder that there are any at all, and unless there is some protection provided for food fish, hook-fishing will certainly be destroyed in a very few years. A. S.

BROOKLYN, N. Y.

THE MASTIGOUCHE LAKES.

OBEDIENT to the welcome cry of the brakeman, "Berthier Junction! All out for Berthier Junction!" we stepped out on to the platform of the depot in this Canadian village, the end of our railroad ride toward the Mastigouche lakes. The evening before we had started from New York in a Montreal sleeper. As the night drew down its curtains and shut off the view of the Highlands and the quiet, placid waters of the Hudson, we turned into our berths and slept soundly until we heard the call, "Mister, the sun is coming." Through those restful hours we had been carried many miles, and as we looked out of the car window off in the east loomed up against the brightening sky Mount Mansfield, the highest peak of the Green Mountains, while to the west the blue sky, catching the ruddy reflection of the sun not yet risen, threw around the tall peaks of the Adirondacks a royal robe of purple, whose folds were only gathered up as they reached down to the waters of the lake. Soon after we were whirling through the Victoria Bridge. After breakfast at the palatial Windsor Hotel, we left Montreal by the North Shore road and a ride of fifty-six miles brought us to Berthier, where we found buckboards waiting to take us into the woods. Ten miles to the little hamlet of St. Norbert, with its beautiful church; then over the foothills another ten miles to St. Gabriel de Brandon, reached just as the darkness was settling down. Here our good host, Belmire, took us in.

The next morning we made an early start for the club house at Lake Seymour. Skirting the southern shore of Lake Maskinonge we soon crossed its outlet, a deep and rapid stream hurrying down to the St. Lawrence. Turning north we soon strike the Mastigouche and follow up its course, crossing high and steep sandhills which seem quite out of place standing so close beside the gray bald cliffs that jut out from the higher hills that shut in the valley. Seven miles brings us to the right branch of the river; here we leave the last clearing and start into the unbroken forest. The road had been opened only this season, and we found it macadamized with the huge boulders that severely tried even the buckboard springs. Three miles and we cross the river—rushing and foaming over its rocky bed—on a very pretty bridge built by Mr. Copeland. Crossing we began an ascent of some 1,800 feet and reached the summit in about three miles. Even from this high point we can see nothing of the valley that lies below us, so thick and high are the spruce and birches that shut us in. As we stop to rest, far off comes the sound of the river as it rushes down through rapids and over falls that carry its foaming waters down 1,500 feet in less than five miles. We now start on the other slope and soon catch glimpses through the trees of the sparkling waters of Lake Seymour, a few minutes more and we are greeted by our friend Copeland, to whom we are to find ourselves under great obligations for his repeated kindness to us. We were surprised to find so good quarters far out here in the woods, and to see all that had been done in the few months since Mr. C. had broken ground.

In the morning we started out for our first fishing. The steady six days' rain had raised the waters of the lakes, so that we found it greatly interfered with our success all the time we were there. The lake Of the Agent was where we first cast our lines. We took twenty-four beautiful trout, many of them weighing a pound each. The following day in Lac au Cap, thirty-six came to our creel, averaging about the same as the day before. The next day, taking our boat over a mile portage, we paddled out on the beautiful Lac la Clere. This day brought us the most sport of any during our outing; seventy fine trout, forty-five with a fly in less than two hours; merry was the click of our reels as some of these gamy fellows bent our five-ounce rods nearly double.

Sunday comes, a day that should be one of rest even to fishermen. In the silence of those grand woods came to me the words of Paul as he stood on Mars Hill and looked down on the beautiful temples of Athens: "God that made the world and all things therein seeing he is Lord of heaven and earth, dwelleth not in temples made with hands;" so here under the arches of the great trees that no hand had formed, beside the walls of towering rocks that no hand had erected, we felt to thank the great Giver for the blue sky, the pure air, the bright clear waters, the restfulness of this beautiful place. Toward evening we made a short portage to Lac au Croix, another to Lac au Roche, then to Lake Monroe, where we were to fish on Monday, our last day in the woods. After a good rest on our beds of balsam boughs we were early in our cedar canoes. We had great expectations of fine sport, as very large trout are taken in this lake, which is reserved for the exclusive fishing of the Mastigouche club. This, next to Lake Seymour, is the largest of the score of lakes in this immediate vicinity, and we found the water much higher than in the smaller ones in which we had been fishing. Only twenty-seven were taken, but their average weight was greater than any of our former catches.

After a short troll in the morning we unjointed our rods and prepared to return to home and work with the feeling that the remembrance of these pleasant hours would be a pleasure to us. In these four days we had taken 157 fish, all of them the red speckled trout, many of them weighing over a pound each. Returning to the club house our carter soon arrived, and at 3 o'clock we started in a pouring rain for St. Gabriel. During the night it cleared up and our ride to Berthier was full of enjoyment. On the divide we looked north; not far from the shore of the beautiful Lake Maskenonge we could see the spire of the church at St. Gabriel, to the west the hamlet of St. Felix, while before us in the near distance the pretty village of St. Nobert, while far away across the plain that lay at our feet and beyond the St. Lawrence rose the Beloiel Mountain. An hour's ride brought us within sight of the telegraph poles and as we heard the whistle of the locomotive we realized that we were out of the woods. Behind us lay the great wilderness that runs far up to the frozen North without a single break, while before us were the busy homes of men. We looked that way with pleasure, too, as we expected soon to reach our homes and greet those who were waiting to welcome us back.

Now a short description of this place, which may interest your readers and I trust induce some of my brother sportsmen to visit it. Mr. Copeland has leased a large tract of crown lands; within its limits are a large number of lakes, every one of them plentifully stocked with trout, no other fish as I am aware being found in them except the food fish of the trout. This season a number have been taken weighing three pounds, and our guide took one a few seasons ago that weighed five. To make this an attractive resort Mr. C. has erected a comfortable house, furnished it well and taken great pains to make it homelike. A ice house filled with ice is on the premises; on the shore a number of cedar and birch bark canoes are waiting, and trusty guides are always ready to pilot you wherever you may wish to go. On nearly all the lakes have been placed excellent boats. We were very fortunate in securing guides, and gladly recommend Captain Heinault and his brother Baptiste, old hunters and trappers. To the sportsman there are other attractions than the excellent fishing. Bear and caribou are plenty. On several of our portages we saw signs of them both. Only a few days before our visit a caribou swam the lake within rifle shot of the house. A short distance from our camp at Lake Monroe is a beaver dam that has been built within a few years, and we gathered chips that they had cut this season. A large golden eagle looked down on us from his perch on the side of the mountain, while the loons laughed as some of the big trout broke from our flies. Go to the Mastigouche lakes.

SPICEWOOD.

CENTRALIA, Pa.

HETERODOX SUGGESTIONS.

THE readers of FOREST AND STREAM do not need to be told of the sparkling rivulets of Berkshire cascading downward over the limestone beds, and of the myriads of trout that inhabit them. The trout themselves are one of the traditional and historical facts of a much-glorified past, as well as one of the live and interesting facts of the immediate present, the only drawback to them, as trout being that they are so much sought after, that few of them attain anything beyond what may be called the juvenile proportions of that delicious fish; but they fry "crisp" all the easier for their smallness, and after all, what is it that the sportsman seeks? Certainly not pounds avoirdupois, in that case he had best go whaling, but he does seek, especially the city man on his summer's outing, rest, recreation, and the excitement of the sport. As a trout has all the wit he ever attains to when he is no bigger than your finger, it takes just as much cautious scheming in the wary approach, and just as much patient waiting before you can fool him into believing your fly real, and just as much skill and knack to safely land him, as if he weighed as much as the sea serpent, while meantime you are drinking in the fresh air, the health that comes from the sunlight, and experiencing the calm, but rapturous joy that beautiful scenery can awaken in the soul; and at every step you are growing stronger, as did Antæus, each time his foot touched the earth.

To enjoy all this requires no costly outfit, and no long and weary journey to far-off regions, as recreation it cannot be surpassed. The streams may be reached from Pittsfield. One advantage of Berkshire, and especially Pittsfield, for men who need rest, but whose business requires watching, is the case with which they can reach New York or Boston, as there are as many as eight different opportunities of reaching New York and five daily of reaching Boston. X. Y. Z.

NIGHT FISHING FOR BASS.

Editor Forest and Stream:

Sandworms are the best bait for striped bass for night fishing. That is according to my experience. I fished for about eight years exclusively at nights for big striped bass at Robbin's Reef, and used in experimenting all sorts of baits, including mackerel bellies and live squids. The latter are a very good bait, but as hard to get as the little spearings, which are also very taking. I hear, however, that squid are now kept for sale in Washington Market. Finally I returned to sandworms, four to five for a bait (bass like a big bunch), and I think it is the best all-around bait for night fishing. Clams and menhaden would give no satisfaction at all on that particular ground.

I have made some very heavy catches at that place, sometimes more than two of us could carry or even lift, and of course as often sailed home with but a few fish. But only two or three times did I leave without having either bass or weakfish to show, although I did not pretend to fish for the latter. But the new comer may anchor there day for day and have no success at all, in fact, may think that the fish gave the lighthouse a wide berth. To be successful on that place one has to study the actions of the tides very carefully and shift his place accordingly. Big bass begin to run there from April 15 to May 20, and Oct. 15 to Dec. 10, and seem to bite only at night. I heard only of two authenticated instances during my time when striped bass over fifteen pounds were caught in the daytime over that reef.

The best sport I usually had during very dark, still nights, on second flood, high water, second ebb, and during the first half hour of young flood. Six hundred feet of best Cuttyhunk line, large sprout hook on double gut, multiplying reel of trustworthy make, and stiffish 12-foot rod are a necessity, as at any time a bass from twenty to sixty pounds may strike. The fisherman who goes there to stay over night must understand rowing and sailing thoroughly, and have a good seaboat under him, not an easily-swamped skiff or cranky narrow-waisted rowboat. It is a ticklish place to be at the seasons I have mentioned. Being foolhardy enough to hold on as long as the sea allowed, I have had some very narrow escapes crossing over to Gowanus, and the short, choppy sea which is kicked up at short notice in the bay would sometimes be almost too much for my 16-foot open boat. But then she was an exceedingly easy rider, and sailed well under trying circumstances.

It is now four years since I made my last cast on that

ground, but I shall ever remember the fine sport it gave me and my chum, and the many incidents, laughable and otherwise, which happened to us in our vigils. By the way, it is strange that there are so very few contributions to the fishing lore from our salt-water fishermen. With them, too, it is not all of fishing to fish. I am really afraid that the wrapt contemplation of the stationary float, or the dreamy expectation of a bite on the handline, brings them too near to Nirvana. PISCATOR.

THE DEVIL FISH.—Galveston, Aug. 1.—*Editor Forest and Stream:* In last week's issue of your valuable paper there appeared an article relating to the monster devil fish seen off the beach here; allow me to add that one of them has been captured and is now on exhibition at the Beach Hotel Museum. Below I write a description of the fish as taken from a reliable paper of this place: "The fish is unquestionably what is technically known as the *Cephaloptera vampyrus*, or devil fish, a cartilaginous fish of the ray family. This is borne out by a careful and critical examination made and a careful comparison with the best authority. Many are so thoroughly imbued with the idea of the *Octopus* as described by Victor Hugo in his 'Toilers of the Deep,' as being a species of the so-called devil fish, that they cannot, in their minds, disconnect anything called a devil fish from the hideous arms or tentacles that the *Octopus*, commonly called the cuttle fish, is known to possess, and which Victor Hugo so graphically describes as the horrible appendages of the devil fish. Victor Hugo's fish is a fictitious monster, the description of which applies to no species of the devil fish, but most resembles the *Octopus* or cuttlefish. The fish now in captivity fits exactly the description given the *Cephaloptera vampyrus*, or devil fish, by the best authorities in natural history. Its head is truncated in front, and provided on each side with a pointed wing-like process, separate from the pectoral fins, and seemingly capable of independent motion. These wings or horns provided on either side of the head are two feet two inches in length. The pectorals or fin-like appendages on either side of the fish are of great breadth, triangular in shape, resembling wings, making the transverse diameter of the fish greater than the longitudinal, with tail included. These pectorals from tip to tip measure sixteen feet four inches, while the body proper is only eight feet in length, and the tail about three and a half or four feet. The jaws are at the end of head, the lower the more advanced, and the transverse diameter of the mouth measures two feet ten inches. The eyes are small and lateral, resembling the eyes of an elephant, and are located on either outer sides of the protudal wings or frontal horns, and are consequently about three feet apart. The tail is elongated like a whip lash, armed near the root with a prominently serrated spinal protuberance. The teeth are small, numerous, flat and arranged in many rows. The mouth when opened could easily accommodate a flour barrel. The nostrils are small and are located near the angles of the mouth."—REDBREAST.

THAT FISHING PROBLEM.—*Editor Forest and Stream:* Concerning Mr. Ira Wood's answer to the "fishing problem," I am thankful for his communication, but it is the very thing which we tried. The logs went into the mud, and I, stepping on them, followed suit up to my hips, and was glad to get hold of my companion's outstretched axe, on the other end of which he performed a Herculean tug of war to get me on terra firma. It is not honest, consistent mud, but a sort of soft ooze. My object in the question was to find out if there is a serviceable, light, portable raft (in the shape of some material to be inflated) in the market, or the best way to construct one. I should think it would find a good sale, because there are a great many lakes in the North Woods and other resorts where it is impossible to bring a boat in, and the rafts made on the spot are at the best but unwieldy, cumbersome makeshifts, which in moving around scare all well-educated trout to the furthest corners. My idea of a proper portable raft is to have about three inflatable bags of thin rubber, which ought not to weigh over fifteen pounds, and having enough buoyancy to carry one man. The sides and ends to be provided with stout lacings to fasten their poles to, which will be covered with a layer of cork, making a light, safe, and easily transported contrivance to conquer all sorts of still waters, and will even slide on top of the treacherous ooze. How handy would such a raft be to outers, who thus can travel from one lake to the other in quest of fish without lugging a boat along.—PISCATOR.

WHERE HAVE THE WEAKFISH GONE?—New York, Aug. 17.—*Editor Forest and Stream:* Since the weakfish seem to have given us the go-by this season, I, one of the many who have sought for them in vain, am only left the consolation of theorizing why it is so. But first, is it so? I have met several parties by whom I have been told that the fish were there, but would not take any bait. This I doubt, for if there the netters would haul them in, and the market price, twelve cents a pound against six cents in '84, shows that they are not there. We all know that weakfish visit our shores to spawn and that all fish require waters of certain temperature for this function. Rockaway, Long Branch, etc., report the surf this year unusually warm, and as the prevailing winds so far this season have been brisk from the S. E., it is clear that the surface and warm waters of the Gulf Stream have been driven inshore, and this is what keeps the fish away. Accepting this conclusion, Where have they gone? Let us have reports from our more northern coasts. At present Jamaica Bay seems full of sand porgies, and large strings were taken yesterday around the "Pot." Even the sea bass seem to have abandoned the poor knights of the angle.—BROOKLYNITE.

DOBSONS.—Binghamton, N. Y.—Seeing in FOREST AND STREAM an inquiry about dobsons I send you my manner of catching and keeping them. I first made me a frame about two feet square and covered it with wire cloth, and stretch this across the current. With a hoe I wade into the riffs on our river, when the stones are raked over, the dobsons are exposed and drift down with the current, where they strike the screen. They fasten their claws in it and will hang there until I pick them off. To keep them I provide myself with a large earthen jar, cover the bottom with sand and gravel, put them in it and partially fill with grass. The grass must be changed every day and wet thoroughly. Another way in which I kept them was to have a watertight box put in my boat, the bottom being bored full of holes. The boat was always in the water, and so they had fresh water and kept very well. I kept a few large stones in the box for them to crawl under. But I prefer the other way. I have kept them for two or three weeks at a time, and when taken out they were very lively.—D. T. G.

RAINBOW TROUT.—Philadelphia, Aug. 18.—There is considerable agitation in regard to the matter of stocking the Wissahickon Creek, which runs through a portion of Fairmount Park, with California trout. Mr. William M. Runkel of this city whom, it appears, is especially interested in this project, has made application for a supply of these fish and has a reply from Prof. Baird to the effect that if application is made through some member of the Senate or House by the Park Commission, it will receive prompt attention. While the Wissahickon Creek, from its mouth to Indian Rock, is made up of spring water and could be well protected by the park guard until the fish propagated, unless every mill on the course of the stream be compelled to cease emptying their refuse dye stuff into the creek and the dams on its course be demolished, we doubt if it would be worth while stocking it. It is stated, however, that all these manufactories have been forced to stop and the most prominent dams taken down. If such is the fact we say go ahead, the experiment is worth trying. Would not the rock bass be a better fish, and would they not furnish fully as much sport to the class of anglers that would seek such waters?—HOMO.

HOW TO CATCH CRAWFISH.—St. Joseph, Mo., Aug. 8.—In your FOREST AND STREAM of July 23 Mr. G. H. Morgan gives "W. L. A." the correct method of catching crawfish. On the Fourth of July, with four raises of my minnow net, I had at least two hundred; but as every one does not have one of our old-fashioned square minnow nets, I will give another very simple and effective way. Take a slight stick about three feet long; attach to one end a string two feet long; tie to end of string a piece of liver or meat about the size of a man's fist. Throw this in the water, raise gently, holding a landing net underneath, and you will have the liver or meat covered with the crawfish, which upon finding themselves out of water fall into the net. I also give my method of cooking them. Into a pot of boiling water put a quart of coase salt, stir well, then put in a bucketful of the crawfish and let them cook ten minutes; take out, remove the shell from the tail, and you have a morsel equal to lobster or shrimp. Does not Dickens tell us in "David Copperfield" that Dame Peggotty was a dealer in "lobsters, crabs and crawfish"?—JAY.

THE BIG RANGELEY TROUT.—Mr. Geo. Shepard Page recently sent his ten-pound Rangeley trout to a Washington taxidermist for repairs, and the taxidermist, Mr. F. S. Webster, explains how he has restored it: "When this trout was caught the art of taxidermy was called stuffing. This subject had been stuffed quite as well as was the rule in those days, no doubt; but still it was stuffed, not mounted. It came down to me in a very dilapidated condition. It had lost the under jaw, its tail and most of its fins, and a good deal of the skin on the under portion of the body had been torn. You see here I have put on that jaw with the tongue and eyes, and I might say the entire head. The tail is mine, and the fins are mine, and I think you will admit they are just as good and natural as ever the fish's own were. Then, you see, I have patched up the belly and painted it all over, and would you know now that ever a piece of the skin had been broken?"

THE DELAWARE BAY TROUBLES.—Attorney General Stockton announces that the difficulties relating to the fishing grounds in the Delaware Bay have been adjusted, and that hereafter New Jersey fishermen will not be molested by the authorities of the State of Delaware if they do not trespass beyond the boundary line. The fishery war between the States has been on the carpet for more than twenty years simply because no one knew where the line dividing Delaware and New Jersey was. The Attorney Generals of both States have agreed upon its establishment from the mouth of the Cohansey Creek due west to Bombay Hook, eleven miles below New Castle.

FORT CUSTER, Montana, Aug. 4.—Some nice trout (*Salmo purpuratus*) are brought in occasionally from the Big Horn Mountains, some of them weighing as much as three pounds. Of course, after having been at Klamath, Oregon, such fish look small, but for this country they are of pretty good size. They are much lighter colored and a handsomer-looking fish than the Western specimens of the same species. We have had our share of the hot weather also, mercury climbing about 100° in the shade several days in succession.—B.

PEACOCK HARL.—In our answers to correspondents will be found a reference to this word which has somehow been twisted into "herl," both in this country and in England. Harl is defined by Webster to be a filamentous substance especially of flax or hemp, while "herl" does not appear at all. Here lies a chance for research into the authorities, which will no doubt bring conflicting opinions, and will also serve a good purpose in stimulating anglers to brush the dust off volumes which have not been opened in years.

TARPON IN NEW JERSEY WATERS.—Seabright, N. J., Aug. 12.—A fine specimen of the tarpon, *Megalops thrissoides*, was taken in a bluefish seine by fishermen near here yesterday. The fish measured five feet nine inches and weighed 120 pounds. It is very rarely that one is caught on this coast, but several have been taken within the past ten years between Cape May and Fire Island. The tarpon always creates a sensation when captured in our northern waters, for few of our fishermen have ever seen one.—J. B.

STATEN ISLAND.—Many hundred anglers go down to Staten Island every Sunday to seek the haunts of the weakfish, sheepshead, sea bass and bluefish. The Staten Island Railway recently put on a special train to carry fishermen down the shore. The result is that every Saturday night a heavy train of from six to ten coaches, all crowded, leaves the boat landing at Stapleton. This season has been a remarkably poor one for fishing. Generally weakfish are plentiful from July 1 until September 15.

PHILADELPHIA, Aug. 15.—The rivers are not clear enough yet for good bass fishing. Many young rock or striped bass are being taken at the wharves along our city front, where the sturgeon boats unload, and where these fish are skinned and dressed; the roe is used for bait. The rock run from eight to twelve inches in length.—HOMO.

BARTLETT'S has been for more than thirty years one of the favorite resorts of Adirondack visitors, and now that the property is for sale, hundreds of anglers will cherish a hope that the old name may be preserved. In our advertising columns will be found a card announcing that the house is to be sold.

THE NEW YORK OYSTER COMMISSION.—Fish Commissioner E. G. Blackford, in charge of the oyster investigation of the State of New York, and his assistant, Prof. H. J. Rice, have been at Peconic Bay, east end of Long Island, part of this week in the U. S. Fish Commission steamer Lookout. The Lookout has been placed temporarily at their disposal for the purpose of examining the planted and natural oyster beds in the waters of the State. They will make a number of short trips to those in the kills near Staten Island and to the natural bed in the Hudson between Yonkers and Haverstraw. A special inquiry will be made to determine whether the beds in the Kills are being injured by the refuse from the oil works which there abound. Two weeks or more will be occupied in these researches. Dredgings will be made and records kept of the general condition of the bottom. Specimens of the oysters taken at each haul will be preserved. The kinds of enemies of the oysters will also be noted, as well as their number, and all soundings made will be recorded.

The Kennel.

Address all communications to the Forest and Stream Publishing Co.

FIXTURES.

BENCH SHOWS.

Sept. 22, 23, 24 and 25.—Dog Show of the Milwaukee Exposition Association. John D. Olcott, Superintendent, Milwaukee, Wis.

Sept. 29, 30 and Oct. 1, 2.—Third Annual Dog Show of the Southern Ohio Fair Association. H. Anderson, Secretary, Dayton, O.

Sept. 29, 30 and Oct. 1.—Twelfth Dog Show of the Western Pennsylvania Poultry Society, Pittsburgh, Pa. C. B. Elben, Secretary.

Oct. 6, 7, 8 and 9.—Second Annual Dog Show of the Philadelphia Kennel Club, in conjunction with the Pennsylvania State Agricultural Society. E. Comfort, Secretary, Philadelphia, Pa.

Oct. 6, 7, 8 and 9.—Fourth Annual Dog Show of the Danbury Agricultural Society. S. E. Hawley, Secretary, Danbury, Conn.

Oct. 7, 8 and 9.—Dog Show of the York County Agricultural Society. Entries close Sept. 28. A. C. Krueger, Superintendent, Wrightsville, Pa.

FIELD TRIALS.

Nov 9.—Second Annual Field Trials of the Fisher's Island Club, for members only. Max Wenzel, Secretary, Hoboken, N. J.

Nov. 9.—First Annual Trials of the Western Field Trials Association, at Abilene, Kan. Entries close Oct. 15. A. A. Whipple, Secretary, Kansas City, Mo.

Nov. 16, 1885.—Seventh Annual Field Trials of the Eastern Field Trials Club, High Point, N. C. Entries for Derby close May 1. W. A. Coster, Secretary, Flatbush, L. I.

Dec. 7.—Seventh Annual Field Trials of the National Field Trials Club, Grand Junction, Tenn. Entries for Derby close April 1. B. M. Stephenson, La Grange, Tenn., Secretary.

A. K. R.—SPECIAL NOTICE.

THE AMERICAN KENNEL REGISTER, for the registration of pedigrees, etc. (with prize lists of all shows and trials), is published every month. Entries close on the 1st. Should be in early. Entry blanks sent on receipt of stamped and addressed envelope. Registration fee (50 cents) must accompany each entry. No entries inserted unless paid in advance. Yearly subscription $1.50. Address "American Kennel Register," P. O. Box 2832, New York. Number of entries already printed **2588.**

THE AMERICAN KENNEL CLUB.

Editor Forest and Stream:

A great deal has been said in regard to the standard committees appointed at the last meeting of the A. K. C., and it seems to me that there is a general misunderstanding by the public as to the duties of these committees, although I can find no difference of opinion among the Executive Committee that were present at Philadelphia, they agreeing with me perfectly. The vote as passed is recorded as follows:

Voted, That a committee of three be appointed on each breed of dogs to report a standard for judging the same at a meeting of the Executive Committee to be held in October.

Upon the motion being made, Mr. Wade immediately asked the president whether these committees were to form a standard from their own ideas or were to inform themselves as to the opinions of the prominent breeders and exhibitors, and his answer was, "That that was just what we wanted, the opinions of the different breeders," etc. The intentions of those of the Executive Committee who expressed any views on the subject were, that these committees were to formulate a standard from the ideas of the breeders, etc., and report to the Executive Committee. The standards, as reported, could be adopted or not at the discretion of the Executive Committee. I, for one, would most certainly object strongly to the adoption of any standard that did not conform to the ideas of a majority of breeders and exhibitors. And, by the way, would it not be a good idea to stop all this noise and fuss until it is seen what standards are reported and what the A. K. C. does with them? I think it is safe to say that nothing will be done to harm the interests of those interested.

I cannot see why the committees, as appointed, are not competent to do the duties assigned them as long as they follow their instructions. Individual attacks have been made to such an extent that a large number have refused to act; and so, many of the committees are "bob-tailed."

I have received several letters from members of committees, asking if they might report Stonehenge's standard instead of making up a new one. At the risk of being classed as a "constructor" I replied that if upon investigation they found that the breeders, etc., wanted Stonehenge I should most certainly report it, and I can see no reason why they are not at liberty to do so in any case if they choose. They were instructed to report a standard, not necessarily a new one. I "kick" as an exhibitor to changing the setter standard from Stonehenge, but I do want judges to have a standard that they must adhere to and not a different standard for each judge as the awards in the past have proved to be the case. I believe that the A. K. C. should adopt standards and have dogs judged by them. The question has been asked, Is the A. K. C. to live or die? I think my friend Wade asked the question, but I know he did not mean it, as that would show, or, at least, indicate that he believed his fellow workers in the good cause were getting tired, and he is too good a fighter to leave the field until right comes to the front. The talk of drawing out of the A. K. C. is all wrong, as the A. K. C. is needed, and the only way to make a success of it is to pull together and fight for the right.

Mistakes have been made, and I have yet to see a new association of any kind that is perfect; but we must stay and try and win the confidence and respect of the public, and when that is done we will be amply repaid for the worry and trouble we are now going through. We certainly gain nothing by staying away from the meetings. The trouble has been heretofore that but few of the working clubs have been represented at the most important meetings, and "King Proxy" has had full sway. And whose fault was that? Blame those who stayed at home; and they are the ones that talk of withdrawing. But the day of the proxy has passed. Under the present rules only one proxy is allowed to any one member of the executive committee. There are those who are doing their utmost to ruin the A. K. C. upon purely personal grounds

and out of spite, as would be plainly seen if these snakes in the grass had the moral courage to sign their names to their articles in the various papers. It is hard to fight an unseen enemy, but compare the A. K. C. to-day with one year ago, and you will see a vast improvement. And why not do as much more in the next year? Give me a few more men on the executive committee such as Wade, Child, Smith and Donner, and I can safely guarantee the respect of the public for the A. K. C., and make it as it should be—a power in dog matters. G. EDW. OSBORN, Sec'y A. K. C.

A DOG SHOW CIRCUIT.

Editor Forest and Stream:

It is desired that the managers of bench shows arrange their dates so that a circuit may be formed for the coming season, and in order that this may be done I would be pleased to have the different clubs send me as soon as possible the dates on which they would like to hold their shows, in order that I may present them to the October meeting of the A. K. C., at which time their representative could help in the arrangement, which cannot but please the exhibitors, and insure a much larger attendance of both dogs and audiences at the shows. G. EDW. OSBORN, Sec'y A. K. C.

BIRMINGHAM, Conn.

THE PITTSBURGH DOG SHOW.

Editor Forest and Stream:

The dates for the coming dog show of our society have been changed to Sept. 29, 30 and Oct. 1. W. WADE,
Sec'y pro tem. Western Pa. Poultry Society.

PITTSBURGH, Pa., Aug. 12.

[We learn that Mr. Chas. H. Mason has been appointed as one of the judges at the coming Pittsburgh dog show. We hope to be able to announce the complete list next week.]

THE PHILADELPHIA FALL DOG SHOW.

THE second fall dog show of the Philadelphia Kennel Club, to be held in conjunction with the Pennsylvania State Agricultural Society, will be given strictly under rules of the American Kennel Club, and the attention of all exhibitors will be asked to the change of form of entry blanks when received by them, especially to the space provided for the breeder's name and the clauses of A. K. C. regulations which refer to that matter as well as to pedigree.

If a pack of hounds can be procured to follow the scent of reynard, who will be led through the open part of the fair grounds near the half-mile race track, an exhibition of what a hunt is like will be given the spectators, and the riders which will follow the dogs will take several hurdles placed in their way. As two or three hunts clubs have stated that their hounds will readily follow such a scent, it is expected the novelty will be presented.

Arrangements are being perfected for collie trials in the same inclosure. The dates of holding the show are Oct. 6, 7, 8 and 9. HOMO.

ANOTHER ODD POINT.

Editor Forest and Stream:

In your last issue "Old H." relates a remarkable point made by Dr. H.'s dog, Augusta, Ga. I have no doubt whatever of its truth, and think I can beat it.

I was returning home just before dusk from a walk through the meadows and my two setters were quartering the ground at a great pace, going down the wind for the most part, when my favorite stopped as suddenly under a shade tree as though he had run against the trunk. But the speed with which he had run and the suddenness with which he let up tilted him forward on his throat and lower jaw, sending his stern straight up pointing to the skies, and in this position he froze. At first I feared he had run a snag into him; but, as the old dog had hauled up and was honoring the position by backing steadily, I concluded to investigate more closely. On going up to him I saw, only six inches from his nose, a young fledgling hidden neatly under a tuft of grass. This I captured with my hands. Still the dog retained his position, and failing to find anything more on the ground I looked up into the tree, and there I saw the old bird directly above the dog. I scared the bird away with my stick and the dog wilted. The poor fellow had been standing with his hind feet off the ground for ten minutes. (He is not for sale.)

This is true—or nearly so—for I would not swear that he did no touch one of his hind toenails to the ground. But I won't give in to another toe. YOUNG H.

GALT, Canada.

THE NEW SETTER STANDARD.

Editor Forest and Stream:

I think the suggestion of "Justitia," in your last issue, is timely and opportune, and trust that your invitation to breeders and exhibitors will meet with the frank and unprejudiced response it deserves. There can be no doubt that Major Taylor's influence is already showing itself in favor of a certain type of setter, and I humbly state my opinion that the result will be disastrous. I fear that were a standard for judging at our bench shows to be adopted, in conformity with the ideas or desires of a clique, of whom Major Taylor is chief, we would be subject to a very narrow and probably very arbitrary scale of points, for his decisions at shows seem to indicate that no setter, however good, can attain high honors at his hands unless he approach the Gladstone type. For this reason many prominent Canadian breeders (and I am told, American breeders also) are reluctant to exhibit their setters where he is judge. Some absolutely refuse to exhibit. I like our high-headed, good-sized (not lumbering), stylish, fast, courageous setters, that go with a graceful swing, much better than some of the little, delicate, pretty pets that have won honors under Major Taylor. Undoubtedly many small setters are not necessarily delicate, but the tendency, when once you begin to reduce the size, is to run into snipe-faced, timid, gunshy dogs. I don't think Major Taylor ever gives high honors to very inferior dogs, but I do know that he frequently gives very inferior honors to very superior dogs, simply because they do not approach his peculiar type. Therefore, any standard that he is likely to arrange will not be popular.

FRANK G. HUGHES.

GALT, Ontario.

Editor Forest and Stream:

As you express a wish for the views of your readers on the setter standard, allow me, as one of your readers, to say that I think when we get perfect specimens of Stonehenge's standard it will be time enough to adopt a new standard. I have owned several prize winners, but they all come short of Stonehenge's standard. What we do require is to stick closer to our present standard and put in judges that will not favor certain types at one show then change at the next show to a different type entirely. Then the breeders will know what is required, and you will find dog shows will be better patronized and better dogs will be the result, and our shows will not require to take in dogs after date to fill up to make a creditable show, and they will not have to offer special inducements to get the owners to bring out their dogs. What is required is different judges that will judge to our present standard and let the best dog win. T. G. DAVEY.

LONDON, Ont., Aug. 15.

Editor Forest and Stream.

In the matter of standards I think the A. K. C. will do well to go slowly; and I am glad to see the invitation extended by FOREST AND STREAM to open a discussion in its columns. At present there is no standard so to speak. A judges in New York, and gives X, Y and Z, 1st, 2d and 3d. B judges in Boston, gives Z 1st, Y 2d, and X 3d, and so on. With such decisions breeders can only draw inferences somewhat as follows: In A's judgment X is best dog; in B's judgment Z is the best.

If there is a recognized standard adopted the same dog should win in both places, his show condition being the same. To remedy, if possible, this condition of affairs is an important part of the work for the A. K. C. WM. H. CHILD.

PHILADELPHIA, Pa.

Editor Forest and Stream:

At a meeting of the Western Pennsylvania Poultry Society, held this day, present Messrs. E. Gregg, President; B. F. Wilson, Vice-President; and Messrs. W. W. Speer, Howard Hartley and W. Wade, directors, the following was unanimously adopted: "Resolved, That this society is opposed to any change in the standard for setters from that laid down in 'Stonehenge.'" EDWARD GREGG, President.
WM. WADE, Secretary pro tem.

PITTSBURGH, Pa., Aug. 11, 1885.

THE ENGLISH SPANIEL CLUB.

Editor Forest and Stream:

As I feel sure the numerous spaniel fanciers who read FOREST AND STREAM will be glad to know what the new Spaniel Club in England is doing, I have pleasure in forwarding you a copy of the rules, which also contains a list of the committee, members, judges approved by the club and the classifications drawn up for the committee for the guidance of show committees.

The principle upon which the Spaniel Club proceeds is to offer a sum of money as a subscription to the funds of the show, varying according to the classification adopted by the show committee and conditional upon the appointment of a judge approved by the club. By this means the show committee receive an amount which will help to cover any deficiencies in entries, and the Spaniel Club in return obtain a classification satisfactory to its members.

I trust you will find space in your valuable paper to publish our classifications for the information of American spaniel fanciers. JOHN S. COWELL, Honorary Secretary.

BURTON GARTH, Clifton, York, Aug. 4.

Following are the classifications recommended: No. 1: Water spaniels—Challenge class and open class, both dogs and bitches.

Clumber spaniels—Challenge class, dogs and bitches; open class dogs, bitches the same.

Sussex and other liver-colored spaniels over 25 pounds weight, same as Clumber.

Field spaniels, black, over 25 pounds, the same.

Field spaniels, other than black or liver, over 25 pounds, the same.

Cockers, any color, not over 25 pounds weight and not less than nine months old, the same.

Puppy class (any variety under twelve months) dogs and bitches—At least two prizes must be given in each class, with the exception of challenge classes. No classes may be cancelled, or the amount subscribed will be withheld. In all cases the prizes must be money prizes.

Classification No. 2: Any variety of spaniel—Challenge class, dogs and bitches. The remaining classification is the same as in No. 1, omitting the challenge and puppy classes.

Classification No. 3 is the same as No. 2, but there is only one class in each division for dogs and bitches.

ENGLISH KENNEL NOTES.

XXXII.

If the Collie Club cleared expenses over their show the committee have reason to congratulate themselves on a lucky "get out." The "undogly" public displayed the greatest apathy toward the exhibition. Although it would not be fair to say the undertaking was not sufficiently advertised, yet I think a good deal more might have been done in that direction. The attendance at the Aquarium itself is not what it used to be, and I am sure I was not the only "young man from the country" who observed this defection with disappointment and regret. Some of us went off to the Inventions Exhibition and found it there. I can't recall any startling fresh appearance in the collie ranks. Mr. Mercier's Dublin Scot scored his first win on English soil. He is a big strong dog, well on the coarse side, as the reporters say. The Harlequin class was rescued from mediocrity by the cup-giver's own entries, Blue Sky and that winsome bitch Blue Ruin. American breeders must not conclude from his position in the prize list that Flockmaster is anything out of the common—he is not. He was placed first *faute de mieux*. Mr. Stewart, the north counties judge, proved the proverbial local longheadedness in selling Young Cockie. The dog has had his day—no more for him the feminine plaudits of the success-worshiping crowd as it gathers round the victor's ornamented bench at the Crystal Palace. Like other phenomenal youngsters, he might have one day or "some day," as the song goes, returned to his puppy form, but this delusion is not for Cockie's owner—the shape of his dog's head has changed for ever and for aye. A dog I thought the judges a little severe upon was Mr. Godfree's Major Trefoil, a smart, genuine collie from the tip of his prying nose to the gracefully swirled up end of his flag. I am sure I hope the Collie Club won't be disheartened by the shabby support accorded them by the exhibitors on this occasion, but give the recalcitrant ones an opportunity of proving their repentance.

The club dined together on the evening of the first day, when circumstances over which, etc., prevented my attendance, had I been able to get an invitation. Through side-channels, watered by the guests, I hear that the gossip of the hour was given a home and habitation. It appears my first impressions on the subject were quite erroneous. The doggy newspaper that was going to, and now has changed hands, is not the one I indicated in my last "Notes," it is the *Stock Keeper*. That this course or some other even more drastic was urgently required has been painfully patent to its subscribers for a long time past. The paper has struggled on pluckily and borne the brunt of some hard knocks in the way of competition. It was first started in Newcastle by a company who hopefully strode along in the track of journalistic failure till they came in sight of the ditch of despair; at this point some wary shareholder suggested selling it and thereby save a bit from the impending disaster. There was no disputing the wisdom of this advice. All they had to do was to find the mug, I mean a purchaser. By a lucky chance they were successful. The proprietor of the London *Sportsman*, satisfied with his first venture in journalism, without much inquiry into the business of the paper, purchased for £500 a concern of which the most that could be said was that it was a "going" one. Being a wealthy man, he survived the swiftly-following dissolution, and complacently pocketed his feelings and the bargain, where they quickly wore a hole.

With the derelict craft he also took on the old crew, who skipped for joy at the prospect of certain pay and no personal risk. The original title was changed, and the *Fanciers' Chronicle* became the ambitious *Stock-Keeper*, and to justify a rise in the rates from two to three pence, they took on stock, horses, cattle, pig, sheep, etc. The former supporters, the fanciers, didn't want to read stock, and objected to the extra penny. On top of this Cassells found a mug, I mean a purchaser for the "dead-alive journal." These people also increased the price, but they also sunk some money and engaged some good men, and in a very short time the *Stock-Keeper* was cut out in stock and poultry. Their dog business was not affected, because in that department the "dead-alive journal" had engaged a real old wrecker, whose ignorance of press navigation continues to run the vessel aground whenever he gets an opportunity. And so the *Stock-Keeper* floundered about in shallow water, subscribers forgot to renew, advertisements fell off. This has been observed from the shore, and a mixed gang of doggy and poultry men have boarded her, the compensation—I can't call it price—paid to the late owner is supposed to be known, but I should consider it a gross piece of impertinence to attempt to find it out or publish if I knew it. I wish the new spec. luck. The ship already shows signs of returning buoyancy; there is a clear passage before it, and with the cheers of her interested friends she will carry the good wishes of "Lillibulero" for a speedy passage into the popular port of success. But back to my dogs. To be so near the sea already makes me feel stewardy.

I have been told with some degree of certainty the names of a few shareholders in the company, but I do not feel at liberty to disclose them. This much only will I say, that the well informed circle to certain and several members of which I have heard these notes have been ascribed—is well represented in the new regime—of course I refer to the "variety class." I have always held the *Stock-Keeper* kennel department to be the best of its kind, and the last few weeks strengthened my good opinion and proved the presence of new hands. The reports are up to date, which I expected when I heard they had secured the services of Mr. Langdale, and the doggy news is fresh and readable. The best part of the paper I think is the weekly letter called the "Intercepted Mail Bag," a novelty, I am told, suggested by Mr. Geo. Krehl. Additional zest is lent these epistles by addressing them to well known persons in the kennel world. The two that have appeared were directed to Mr. Ashwin, the collie breeder, and Herr Lang, the German authority on canine matters.

I see from the daily press that the outgoing liberal ministry have marked their appreciation of art by conferring a baronetcy upon Mr. Millais, a name familiar in the doggy world from the connection of the great painter's son with dachshunde and bassets. I also see from the *Stock-Keeper* that Mr. Everett Millais has returned to England with a new dog that is to upset some calculations.

In a breach of promise case tried last week in our law courts the faithless one's letters were read for the amusement of the gaping idler and the briefless barrister. Among other funny passages the following struck me as being decidedly original:

"Oh! dearest! instead of being now as you are in cold, foggy, unsympathetic London, I would to heaven and Cupid that you were by my side promenading the parade at Eastbourne—would we not make the very dogs envious and jealous." (Loud laughter.)

My own knowledge of the habits of dogs inclines me to believe that it would take a good deal of that sort to make them "envious and jealous."

The latest fad is rough black and tan terriers. Most doggy men have from time to time, when out of the beaten track of the dog show, come across one of these specimens that a few restless spirits now design promoting into a "breed." There would be no difficulty whatever in breeding these terriers to a type, but I can't see the use of it, for they look frightful mongrels. In Ireland there is a manufactory ready to hand. When I was over there a few weeks ago a man who keeps a few wire-hair fox-terriers for rabbiting told me on patriotic grounds he tried to breed Irish terriers for his purpose, but gave them up in dudgeon on finding a black and tan pup in nearly every litter. Subsequent inquiries, he told me, showed that this was due to an early cross with the smooth black and tan to infuse quality and a harder coat of a richer red color. The original Irish terrier he says was a big animal, as large as the modern Airedale, with a shaggy pily, soft and hard hairs mixed, coat, usually of a light yellow or gray color, so that he argued, the very dark red ones are the most likely to throw black and tans. The experiment of crossing smooth dogs with rough to make the coats of the latter harder, has, I believe been successfully tried by Mr. Harding Cox. However, the fact remains that according to my Hibernian friend that a dog of the sort required, with all the merits claimed for the Irish terrier, can be bred *ad libitum*, so there is at any rate no need to scour the streets for black and tan mongrels. The pioneers who are interesting themselves in this movement, have made up their minds to assign the breed a Welsh origin, so quickly do we advance in kennel matters nowadays that a class and entries have already turned up in a Welsh show. Each portion of the kingdom of Great Britain has now its own terrier—we have the white terrier for England, the dichard for Scotland, the Irish for the Green Isle, and now the rough black and tan for Taffyland. We are a doggy family!

I have generally been able to praise that ephemeral little sheet, the *Scottish Fancier*, when I have had occasion to speak about it, but lately I have noticed a bumptious tone not in keeping with its modest position. In his July number "Segusian" loftily refers to the fact that "Stonehenge" had refused to accept the Irish terrier as a genuine breed. Having just been writing about that variety I had the inclination to look up the matter; so I reached down from my book shelf that authority and found it was even as "Segusian" had stated, but I also noticed I had got the old edition, so I referred to the last issue of the work and there found quite a different state of things. In the 1882 edition the note has disappeared, and a paper on the breed is printed from the pen of a well-known English enthusiast. I think that those who seek to instruct the public should at least be in a position to supply themselves with the latest editions. In the same note our Scotch friend says: "'Stonehenge' must be a thorn in the flesh of those who live in worlds of fancies, and look to the money that is to be made out of their speculation." Now, what arrant twaddle is this. Has "Segusian" reason to thank God that he is any better than his neighbors in this respect? I think not.

The Kennel Club were again most fortunate in the glorious weather that favored their summer show in the Crystal Palace grounds. The financial result was, I believe, as usual, unsatisfactory. The event of the week appears to have been the arrival in this country of a celebrity from the American kennel world, Dr. Perry. I learn from the *Stock-Keeper*—in fact, I may say that since the change in this journal I depend a good deal on its pages for information—that Mr. Perry is a mastiff fancier and an author. I hope his works will be published here, for although it cannot be said we are in point of numbers badly off for books on the dog, yet there is always room for a good one. That singular body, yclept the variety class, into the constitution and object of which I intend to make inquiries, appear to have feted the "lion."

The St. Bernard Plinlimmon ("Plain Lemon," as the facetious style him) again changed hands at £700, it is said, but I must admit that I am able to attach very little importance to these published prices; there is no question about their being a splendid advertisement, whether they are fictitious or not.

It was advertised before the show that Mr. Joplin's kennel would come under the hammer at the Palace, but only one or two were sold. Selling by auction is an unprofitable means of disposal.

The Brighton show, in entries, quality, attendance and general interest, exceeded the most sanguine expectations. The sight must have been rather a sickening one for the Kennel Club, which made such a complete fiasco there a year or two ago.

A little incident happened at this show which has been carefully hushed up by our kennel press, not even the enterprising *Stock-Keeper* mentioning it. I suppose there is some motive for this clemency, and as I have no wish to give pain to feelings already spared by the Brighton committee, I will also withhold names, though they are known to me. An inquisitive southern exhibitor discovered in a prize winner a physical defect that if pointed out would entail disqualification. The exhibitor could have lodged an objection or he could have left it alone on account of the personal unpleasantness that so

often results from objecting to your friends' or acquaintances' dogs. It is perhaps not surprising that the exhibitor did not adopt this course; but he thought something was due to him for his discovery and forbearance, so he sought out the owner and after explaining the position of affairs, chivalrously offered to swallow his feelings of righteous indignation for the modest solatium of 10 shillings. The wily owner quickly discerned that he had caught the downy one napping, and not appreciating the manner in which the plan had been unfolded to him, gently wended his way to the secretarial office and placed the matter in the hands of the committee. When the ensuing inquiry was made, witnesses were called to prove that Mr. Exhibitor had said to Mr. Owner, "If you give me half a quid I won't object to your dog." So Mr. Kennel Club Secretary was consulted, and taking the august position of the parties concerned into consideration, it was decided that the case should not be bruited abroad, but that for his offense Mr. Exhibitor, who had won several prizes at the show, should be mulcted of his prize money. Mr. Owner's dog was, of course, disqualified; but what was that small misadventure to the "sleep of the just" enjoyed by that forgiving soul as he that evening sought the soothing comfort of his connubial couch! Of course, this case opens up the old question which the Kennel Club, in its anxiety for "peace and quietness," continues to allow to slide, Why should the disagreeable task of objection be thrown on the shoulders of a brother exhibitor? Why should not the committee of a show take over the objection on the facts of the matter being laid before them? It is quite certain that many a delinquent goes free because the others dislike "a row" or because they have reasons for not wishing to "offend him."

The first outing of the Great Dane Club was held in the meadows of that select suburban club, the Ranelagh. Nothing striking made its appearance, and the show is likely to live in the memory of exhibitors for the sensational return of Mr. Frank Adcock and the vicious attack upon the awards of the judge. I am told Mr. Adcock went about unrecognized for some time. Before he left England he affected the "make up" of the Society of Friends, and it was difficult to realize that the military, foreign-looking individual with the luxurious and fiercely-waxed moustache could be the same person. Mr. Adcock had been to Spain and brought back with him another Spanish bulldog, which he had the great misfortune to lose from suffocation in its hamper while journeying to the Crystal Palace Show. It must be confessed that the Rev. Gambier Bolton did not judge according to the knowledge of Great Danes he is credited with. Several very big blunders were made, but no errors, however gross, could justify the unusual sight of exhibitors deliberately insinuating that the reverend gentleman had been bribed before the show. This affair has caused a great stir in kennel circles, and the owner of the first prize winner has offered a reward of £50 for the name of the person who put about the disgraceful charge. Incidents of this nature are happily of rare occurrence in England, and for the credit of the fancy I should be glad if somebody could be caught to be made an example of. Some of the Great Dane breeders complain that Mr. Bolton makes a business of his hobby, and assert that he lately made a tour on the Continent and brought back with him a herd of Great Danes which they say he has since been selling wholesale and retail. They appear to further consider that his being a clergyman is a reason against his making a profit out of dogs. That is purely a question of professional etiquette on which I am not able to give an opinion, but as a member of the Kennel Club, I should say he is unquestionably entitled to all its privileges—dealing among them.

Difficile est satiram non scribere. LILLIBULERO.
JULY, 1885.

[This letter appears to have been delayed in the mails.]

CURRENT DOG STORIES.

SAVANNAH rejoices in the possession of a dog with a history, and if the Charleston *News* is to be credited, with something more than average dog sense. It is a little black and tan named Express, owned by Mr. J. H. Tucker, a clerk in the Southern Express office in the city. Express has spent ten or twelve years in the service of the company. When he was a puppy he used to run on the road from Dupont to Jacksonville. He was then owned by a messenger on that line and accompanied his master on every trip. He had a snug piece of blanket in one end of the car, but he generally preferred to perch himself on the top of some box out of the way. Naturally he made a dozen of acquaintances among his own species at all of the stations. Tradition says that it was a daily occurence to see the village dogs run to the depot to meet "Old 35," the train on which Express was a daily passenger. They apparently knew the whistle of the locomotive. The moment that the conductor shouted "All aboard" Express would run upon the platform and slip in the baggage car just as the train moved off. Occasionally in the midst of the fun he would get too far away, and would fail to get back in time to catch the train. He would gaze wistfully down the track until the rear car disappeared from sight, and then resume play until the next train drew up. If it was going his way he would jump on when it stopped and follow "35." He would always find his master at one of the terminals. Three or four years ago he gave up the road and took up a permanent residence in Savannah. Once in a while he would disappear from home and go off over the line somewhere. Sometimes he would turn up in the office in Charleston, where he was well known, and spend a few days there. He was a pet with all of the men, and on these visits was well taken care of. He is said to have an excellent memory, and knows when the train leaves for Charleston, Jacksonville, or anywhere on the line.

A dog went every day, with a dime given him by his master, to buy meat for his dinner at a butcher's shop. The dog always presented his dime, which went into the till, and then his meat was given him and he trotted home with it. One day the butcher thought he would play a trick on his customer, just to see what he would do. So he put the dime in his drawer and went about other business. The dog waited patiently a long time to be waited on, showing some signs of impatience. The butcher made no sign of serving him. Finally the dog began to bark violently, walking meanwhile from the till to the chopping block. "What do you mean, you rascal!" shouted the butcher. "Get out of here; get out!" And he kicked the dog out of the shop. The dog lingered an instant, and then trotted away in a determined manner down the street. In a few minutes he came back—with a policeman.—*Boston Record.*

"Lew" Bennett's huge, good-natured and intelligent Newfoundland, Bruno, was recently muzzled by his master, in compliance with the village ordinance. The muzzle used was a leather one made at a neighboring harness shop. Soon after the muzzle was attached to the dog's nose, which was done at the harness shop, the dog took a "bee line" for home. After being absent for a short time Bruno again appeared at the shop with the muzzle, which he had in some manner detached, and going up to the workman who had manufactured the article, he laid it down at his feet and walked slowly away with an air of mingled scorn and injured innocence, which plainly said, "I have no use for such a thing as that." The next night the muzzle was again placed upon him, and soon afterward it was found, but Bruno up to the present date has been missing.—*Ithaca Journal.*

BLACK AND TAN SETTER STANDARD.—*Editor Forest and Stream:* All persons interested in black and tan setters will please communicate with Mr. H. Clay Glover, No. 1,293 Broadway, New York, giving their views on standard for the same.—H. CLAY GLOVER.

SENSATION'S BOSTON PRIZE.—Birmingham, Conn., Aug. 15.—*Editor Forest and Stream:* I have been asked if the A. K. C. have ever taken any official action in regard to the Sensation matter at the late Boston show. I can find no record of the matter having been brought before the A. K. C. and I certainly have no recollection of its having been brought up at any meeting, and I have been present at every meeting of the association and the executive committee since its start, except those held in Cincinnati.—G. EDW. OSBORN, Secretary A. K. C.

NOT A DANIEL.—*Editor Forest and Stream:* Late issue of your paper says "Daniel" C. Bergundthal, of Indianapolis, has been selected as one of the judges of the Eastern Field Trials, to be run in November. Daniel! plain, hard, cold Daniel. Why, even the children in this town call him Dave, and with no disrespect, but rather as a tribute to his genial nature which has made him a favorite with all who know him.—HOOSIER (Indianapolis, Aug. 12).

YORK (PA.) DOG SHOW.—*Editor Forest and Stream:* A bench show of dogs will be held in connection with the coming York county fair, York, Pa. The dates set for the dog show are Oct. 7, 8 and 9. This department will be under the supervision of A. C. Krueger. A liberal prize list has been provided and the best of arrangements will be made for the comfort of all dogs entered. Entries close Sept. 28. Entry blanks can be had upon application to the secretary of the York County Agricultural Society, York, Pa., or A. C. Krueger, superintendent, Wrightsville, Pa.

PROTEST OF MIRO.—The case of the protest of the Newfoundland dog Miro at Philadelphia last May has been referred to the A. K. C. Committee on Discipline, consisting of Messrs. L. L. Morgan, New Haven; H. W. Child, Philadelphia; A. W. Pope, Boston; W. Wade, Pittsburgh; C. M. Munhall, Cleveland, O. Any one interested in the case or having knowledge of facts in relation thereto, is requested to communicate with the committee.

DAYTON (O.) SHOW.—Dayton, O., Aug. 15.—*Editor Forest and Stream:* The judges will be: Setters and pointers, J. W. Munson, of St. Louis. Foxhounds, beagles and field spaniels, B. F. Seitner, of Dayton. Other classes, G. H. Hill, of Cincinnati.—H. ANDERSON, Secretary.

AUGUST FANCIES.—Heat expands the imagination of the newspaper reporters. One of them credits Mr. Pierre Lorillard with having paid $10,000 for two setters and $2,500 for another.

KENNEL NOTES.

NOTICE TO CORRESPONDENTS.

Kennel notes are inserted in this column free of charge. To insure publication of notes, correspondents MUST GIVE the following particulars of *each animal:*

1. Color.
2. Breed.
3. Sex.
4. Age, or
5. Date of birth, or breeding or of death
6. Name and residence of owner buyer or seller.
7. Sire, with his sire and dam.
8. Owner of sire.
9. Dam, with her sire and dam.
10. Owner of dam.

All names must be *plainly* written. Communication on one side of paper only, and signed with writer's name.

NAMES CLAIMED.

☞ *See instructions at head of this column.*

Spectre. By Ben O. Bush, Kalamazoo, Mich., for blue belton English setter dog, whelped Feb. 4, 1885, by Van Buren (Royal Sultan—Reign) out of Cute Daisy (Count Noser—Cute).

Fantine and Mona. By Kilmarnock Collie Kennels, Dorchester, Mass., for sable and white collie bitches, whelped June 24, 1885, by G. R. Krehl's champion Eclipse out of Dahlia (Rutland—Buttercup).

Duty. By H. J. Clapham, Flemingville, N. Y., for orange tawny and white smooth-coated St. Bernard dog, whelped Oct. 27, 1884, by J. H. Murchison's Sirius (Medor—Bess) out of Thora (Bismark—Dewdrop).

Orgar. By H. J. Clapham, Flemingville, N. Y., for orange tawny and white rough-coated St. Bernard bitch, whelped June 27, 1883, by Hector II. (E.K.C.S.B. 14,861) out of Nires II. (champion Bayard—Nires).

Apa June. By H. J. Clapham, Flemingville, N. Y., for dark tawny and white smooth-coated St. Bernard bitch, whelped Dec. 10, 1884, by Don II. (A.K.R. 1161) out of Alma II. (A.K.R. 276).

Girola. By H. J. Clapham, Flemingville, N. Y., for orange tawny and white smooth-coated St. Bernard bitch, whelped July 29, 1884, by Caesar (A.K.R. 22) out of Daphne II. (A.K.R. 489).

Nemon. By Stanton Gulon, New York, for fox-terrier bitch, whelped May 11, 1885, by J. E. I. Grainger's Tyke (Tee Side Lad—Vic) out of Lady Gay.

Wildwood, Meander, Bliss, Melody, Harmony and Discord. By Half-Way Brook Kennels, Glens Falls, N. Y., for four black, white and tan beagles, two dogs and two bitches, and two white and black, one dog and one bitch, whelped Aug. 11, 1885, by Joe (Ringwood—Gipsey Queen) out of Constance (Ringwood—Maida).

Bannerman II. By A. C. Krueger, Wrightsville, Pa., for white, black and tan beagle dog, whelped July 5, 1885, by Bannerman (A.K.R. 1709) out of Queen (A.K.R. 1726).

Zora. By A. C. Krueger, Wrightsville, Pa., for white, black and tan beagle bitch, whelped Aug. 27, 1874, by imported Ringwood out of Maid.

BRED.

☞ *See instructions at head of this column.*

Bellegarde—Flash. Surrey Kennels' (Ellicott City, Md.) pointer bitch Bellegarde (A.K.R. 1520) to W. L. James's Flash (Sensation—Gipsey), June 15.

Jean—Pilot. C. E. Scott's (Schenectady, N. Y.) cocker spaniel bitch Jean to Ideal Kennels' Pilot (A.K.R. 1635), Aug. 10.

Daisy—Dandy Zulu. S. T. Thayer's (New Haven, Conn.) cocker spaniel bitch Daisy to Ideal Kennels' Dandy Zulu (A.K.R. 382).

Queen—Bannerman. A. C. Krueger's (Wrightsville, Pa.) beagle bitch Queen (A.K.R. 1726) to his Bannerman (A.K.R. 1709), May 3.

Flirt—Bannerman. A. C. Krueger's (Wrightsville, Pa.) beagle bitch Flirt (Prince—Daisy) to his Bannerman (A.K.R. 1709), May 24.

Pigeon—Bannerman. Wm. L. Mann's (Elizabeth, N. J.) beagle bitch Pigeon (A.K.R. 1725) to A. C. Krueger's Bannerman (A.K.R. 1709), July 7.

Susan—Bang Bang. S. Thorne's pointer bitch Susan to Westminster Kennel Club's Bang Bang (A.K.R. 394), June 14.

Spinaway—Bang Bang. Westminster Kennel Club's (Babylon, L. I.) pointer bitch Spinaway (Garnet—Keswick) to their Bang Bang (A.K.R. 394), June 21.

Polly—Bang Bang. Westminster Kennel Club's (Babylon, L. I.) pointer bitch Polly (A.K.R. 212) to their Bang Bang (A.K.R. 394), July 7.

Susan Jane—Bang Bang. Fred F. Merrill's pointer bitch Susan Jane to the Westminster Kennel Club's Bang Bang (A.K.R. 394), July 26.

Rose—Bang Bang. Westminster Kennel Club's (Babylon, L. I.) pointer bitch Rose (A.K.R. 214) to their Bang Bang (A.K.R. 394), Aug. 7.

Bellona—Bang Bang. Westminster Kennel Club's (Babylon, L. I.) pointer bitch Bellona (A.K.R. 204) to their Bang Bang (A.K.R. 394), Aug. 10.

Gaily—Royal Ranger. Howard Hartley's (Pittsburgh, Pa.) English setter bitch Gaily (A.K.R. 2274) to his champion Royal Ranger (A.K.R. 2200).

ERIE—TAMMANY.—*Editor Forest and Stream:* In your last issue you say Mr. T. F. Rivers's pointer bitch Erie was served by Tammany on July 30. Erie was served by my Bang Grace on July 29. Will Mr. Rivers kindly explain?—LUKE W. WHITE. *Editor Forest and Stream:* Please insert the following: Grace Kennels claim that my pointer bitch Erie was served by Bang Grace on July 28. Now I deny that Erie was bred to him. She is a large bitch, 60 pounds, and Bang Grace is extremely small, about 37 pounds. I went three days in succession to breed her to him, but owing to the great difference in size could get no service. I then bred her to Tammany, and he will be the sire of her puppies if she proves to be in whelp.—T. F. RIVERS (Bridgeport, Conn.).

WHELPS.

☞ *See instructions at head of this column.*

Lady Maud. Surrey Kennels' (Ellicott City, Md.) pointer bitch Lady Maud (A.K.R. 1157), June 27, eleven (seven dogs), by C. H. Mason's Beaufort (A.K.R. 694); ten lemon and white, one liver and white; one dog and three bitches since dead.

Dixie. S. L. Farrar's (Bath, Me.) beagle bitch Dixie (Flute—Thorn), July 28, six (five dogs), by J. Purrington's Snyder (Ringwood—Gipsey Queen).

Una. Dr. E. B. Weston's (Highland Park, Ill.) beagle bitch Una (A.K.R. 1324), Aug. 7, seven (one dog), by Bannerman (A.K.R. 1709).

Regina. A. Grant's (New Brighton, S. I.) mastiff bitch Regina, July 1, six (one dog), by Homer (A.K.R. 1030).

Queen. A. C. Krueger's (Wrightsville, Pa.) beagle bitch Queen (A.K.R. 1726), July 5, six (four dogs), by his Bannerman (A.K.R. 1709); all white, black and tan.

Pearl Blue. Chas. York's (Bangor, Me.) English setter bitch Pearl Blue (A.K.R. 1542), Aug. 15, six (four dogs), by his Gun (A.K.R. 1538); all black, white and tan.

Constance. Half-Way Brook Kennels' (Glens Falls, N. Y.) beagle bitch Constance (Ringwood—Norah), Aug. 11, seven (three dogs), by Joe (Ringwood—Gipsey Queen).

SALES.

☞ *See instructions at head of this column.*

Beausire. Liver and white pointer dog (A.K.R. 1656), by Surrey Kennels, Ellicott City, Md., to H. B. Thomas, Troy, N. Y.

Beaulieu. Liver and white pointer dog (A.K.R. 1779), by Surrey Kennels, Ellicott City, Md., to J. A. Denton, same place.

Genevieve. Blue belton English setter bitch, 3yrs. old (London—Dawn), by T. G. Davey, London, Ont., to Grand River Kennels, Galt, Ont.

Sam. Liver cocker spaniel dog, whelped May, 1884 (Pilot—Beauty), by Ideal Kennels, New Haven, Conn., to M. D. Bacon, New London, Conn.

Franz Boniward. St. Bernard dog (A.K.R. 478), by C. G. Hawk, Abilene, Kan., to Daniel Boone, Kansas City, Mo.

Joker. White, with fawn markings, Italian greyhound dog, whelped April 2, 1885 (Puck—Zelpha), by H. C. Burdick, Springfield, Mass., to Charles F. Peregoy, Baltimore, Md.

Gertie F. Mastiff bitch, whelped June 15, 1885 (Turk—Druidess), by E. H. Moore, Melrose, Mass., to N. Bonneville, Danville, Can.

Bruce. Mastiff dog, whelped June 22, 1885 (Turk—Bess), by E. H. Moore, Melrose, Mass., to C. E. Morrill, Deering, Me.

Blue Cap. White, black and tan beagle dog, 9yrs. old, pedigree not given, by A. C. Krueger, Wrightsville, Pa., to E. E. Shaler, Pittsburgh, Pa.

Jessey. White, black and tan beagle bitch, whelped Nov. 21, 1883 (Mark Anthony—May Belle), by A. C. Krueger, Wrightsville, Pa., to W. J. Percival, Stanton, Mich.

Bannerman—Floss whelps. White, black and tan beagles, dog and bitch, whelped Feb. 11, 1885, by A. C. Krueger, Wrightsville, Pa., to Jas. Gibson, Pittsburgh, Pa.

Dandy—Beauty whelp. White, black and tan beagle bitch, whelped Dec. 18, 1884, by A. C. Krueger, Wrightsville, Pa., to F. G. Hughes, Galt, Ont.

Grand Duke. White, black and tan beagle dog, whelped Dec. 13, 1881 (Prince—Flora), by A. C. Krueger, Wrightsville, Pa., to E. E. Shaner, Pittsburgh, Pa.

Pigeon. White, black and tan beagle bitch (A.K.R. 1725), by A. C. Krueger, Wrightsville, Pa., to Wm. L. Mann, Elizabeth, N. J.

Mottle. White, black and tan beagle bitch, whelped Feb. 3, 1884 (Ringwood—Maida), by A. C. Krueger, Wrightsville, Pa., to Wm. L. Mann, Elizabeth, N. J.

Ranger. Black, white and tan foxhound dog, 2½yrs. old (Ringwood II.—Roxey II.) by W. H. Moller, New York, to F. G. Griswold, Far Rockaway, L. I.

Rutledge. Red Irish setter dog (A.K.R. 1860), by Chas. S. Davol, Warren, R. I., to H. W. Remington, Geneseo, Ill.

IMPORTATIONS.

☞ *See instructions at head of this column.*

Duty. Orange tawny and white smooth-coated St. Bernard dog, whelped Oct. 27, 1884 (Sirius—Thora), by H. J. Clapham, Flemingville, N. Y., from John Angell, London, Eng.

Orgar. Orange tawny and white rough-coated St. Bernard bitch, whelped June 27, 1883 (Hector II.—Nires II.), by H. J. Clapham, Flemingville, N. Y., from John Angell, London, Eng.

DEATHS.

☞ *See instructions at head of this column.*

Surrey Sam. Fox-terrier dog (A.K.R. 1489), owned by Surrey Kennels, Ellicott City, Md., from poison.

Surrey Vic. Fox-terrier bitch (A.K.R. 1904), owned by Surrey Kennels, Ellicott City, Md., from consumption.

Faustine. Liver and white pointer bitch (A.K.R. 1660), owned by Surrey Kennels, Ellicott City, Md., from inflammation of the bowels.

Spice. White and lemon fox-terrier dog, 4½yrs. old (Belgrave Joe—Clove), owned by Clovernook Kennels, New York, Aug. 13.

Paris IV. English setter dog, age not given (Paris III.—Forest Ida), owned by Grand River Kennels, Galt, Ont., from poison.

Victress II. English setter bitch, age not given (Paris III.—Forest Ida), owned by Grand River Kennels, Galt, Ont., from poison.

Nellie. English setter bitch, age not given (Dick Laverack—Liddersdale), owned by Grand River Kennels, Galt, Ont., from poison.

KENNEL MANAGEMENT.

☞ **No Notice Taken of Anonymous Correspondents.**

J. C. B., Athens, Me.—1. What can I use to kill lice upon a Gordon setter? 2. What shall I give him for improvement of his blood? His eyes seem to matterate more than I think they should. Has had distemper. Ans. 1. Take four ounces quassia chips steeped in a pail of water; wash the dog thoroughly with the decoction, using strong soapsuds with it. Repeat once a week until the vermin disappear. 2. Get a dozen "aloes and iron" pills and give one morning and evening hidden in a bit of meat. The pills may be procured at any druggist's.

SETTER, Baltimore.—My dog bruised his elbow and water collected under it to the size of a small egg. I had it lanced, and as it gradually healed gristle formed under the skin to about the size of an English walnut. I had it cut out by our best veterinary surgeon. He did it beautifully, not leaving a particle of gristle. It is now healing, but unfortunately the gristle is forming again. It is very ugly and I am very anxious to get rid of it. Can you tell me the cause of its returning? Ans. The trouble is that the incision left by the operation is in such a movable spot that every action of the dog keeps it in motion and tends to draw the edges apart and irritate the sac. The proper way would be to put the dog's limb in an immovable splint, such as plaster of Paris, until the wound had entirely healed.

D. R., Troy, N. Y.—My cocker spaniel, nine months old, has a warm dry nose, eyes bloodshot and inflamed, lids relaxed and a thick matter runs from them. A thick, dark, dry, gluey matter within the ears, breath smell bad, coat loose, hair coming off in some places leaving a raw sore. He makes a peculiar noise (not a cough), retches and vomits a small quantity of frothy-looking fluid, appetite not good, though he does not refuse food. Ans. Your dog has distemper. While the fever is present, as indicated by a hot, dry nose and rapid, bounding pulse, give three drops of the tincture of aconite root every hour until improvement comes. Give three grains of quinine three times a day in pill form. You can conceal the pills in a bit of meat and the dog will bolt it. Mix three drops of Fowler's solution of arsenic with his food twice daily. Do not feed richly but give nutritious diet. If the dog becomes weak you must give teaspoonful doses of whisky mixed with water every three hours. Spray inhalations of carbolic acid and water, strength, teaspoonful to pint, are effective. Put lime water with the milk, a tablespoonful to the pint. Give oatmeal porridge, beef soup without fat, a very little cooked meat in Indian meal mush.

Rifle and Trap Shooting.

THE "FOREST AND STREAM" RIFLE TRIAL.

Editor Forest and Stream:

Mr. E. A. Leopold in your issue of Aug. 13, invites criticism on the points he presents in reference to your proposed rifle test of hunting rifles. I beg to offer a few kind comments on his several points, but will not avail of criticism to do it.

It seems to me that he does not fully grasp your proposition, but wanders off into other matter. You propose to make on your own account an independent test of hunting rifles. No such test to any great extent has ever been made in the United States. Hence you are the head and chief of it, and cannot be expected to recognize the rules of the National Rifle Association of America, as regards weight, trigger pull and sights." You are engaged in a different business from this association or any other. This fact sets aside Mr. Leopold's first proposition, where he says, "The rifles should conform to the rules of this Association as regards weight, trigger pull and sights." Not a bit of it, for you are your own chief and law maker. You offer is gratuitous and sensible to the last. You want no one's rules, and the less rules you have the better.

Your trial will be from a machine rest, no doubt, and this is correct, for it serves to place all rifles, heavy and light, very nearly on the same level; the light ones cannot well spring or "buckle," as they call it, and if any one shall do so, it will justly call out its own doom. A springing rifle is next to worthless at best. Thus the machine rest sets aside the matter of "weight."

Next comes "the trigger pull." This point of Mr. Leopold's is not sound in fact, for the height of trajectory sought is entirely inde

pendent of the trigger pull; it is the same whether the trigger is pulled by one ounce or a thousand pounds. Pulling the trigger produces no effect on the velocity of the bullet, and hence it cannot affect the height of trajectory. This fact sets his point of trigger pull aside.

Next in order comes the "sights." These cannot affect the height of the trajectory any more than the lock cock or trigger. And as the rifles are to be shot at a dead rest and in the same identical spot at each shot, the sights become a matter of no essential importance. The targets will be measured as groups of shots, wherever the groups may be; and not from around the center of the bullseye, which will probably be invisible as the result of the intercepted screens. Thus his point as to "sights" is virtually set aside. All that is necessary in the case is to have the rifle so pointed as to throw its bullet anywhere within the screens.

Next in order comes his point on "paper patched" bullets: which he says "should not be allowed." This point perhaps stands already set aside in your editorial announcement, where you say the usual hunting (fixed) ammunition will be used. This refers to breechloaders, and the announcement is religiously correct, right, just and fair. If other ammunition were to be used the trial would be stripped of quite all its value.

It is presumable the loads of these rifles are the very best that can be used in them. Be this as it may, they are the result of over thirty years of trial, nor does this issue at all concern the trial to be made by you. The question is one of to-day—How do our hunting rifles shoot with their hunting and appropriate ammunition? This question you propose to answer, and to do so authoritatively you propose to test them, and then report the valuable facts to your readers. This is the only way to do it.

Next in order comes the muzzleloader, which Mr. Leopold says "should be allowed a cloth patch." Yes, this is right, for it has always used it since this much cherished type of a hunting rifle first came into existence. He says the breechloaders should be excluded unless "they use a cartridge such as is recommended [or issued] by the manufacturers." This is the very kind of ammunition you propose to use, and this is all right. But whether you should exclude, as he proposes, a breechloader for using a paper-patched bullet is more than doubtful with me. Would it not exclude some hunting rifles very unjustly?

He says: "Muzzleloaders should not be overcharged with powder. A normal charge, such as is used in shooting game, should be selected, and a charge which would produce excessive recoil in a ten-pound rifle, endanger the bursting of the barrel, or cause wild shooting, should not be allowed."

As to the muzzleloader bursting and kicking, with its light ball, and the breechloader not, with its heavier ball, you need have no fear of the former, but I will not vouch so freely for the latter. Yet in either case I think you will live through it; so do not be alarmed on this score, Mr. Editor, nor you, the rifle tester and shooter. I regret that this point of danger has been touched upon by Mr. Leopold, however innocently he has done it. I have no doubt that your much experienced rifle tester will see to all of this.

I fully agree that the muzzleloader should not be overcharged so as to produce "wild shooting." And I am fully satisfied that those who shall present them for trial have too much sound sense to overload them. They will, of course, present them with the very best charge they can adopt in order to do the best work, to wit, to make as flat a trajectory as possible and yet as close a group as the rifle can make. This is the very purpose and end of the trial, and it is left as a right for the muzzleloader man to say what his charge shall be, and if this shall be unsatisfactory, then he will not consent, of course, to have his rifle tried. As to hunting charges, these vary in this rifle from the lightest to the heaviest powder charge, from the squirrel, to the deer, bear and buffalo charge. The old hunter's rule, and now more than a century old, was and is, "To increase the powder charge (for long ranges) just as long as the rifle shoots steady, and then stop." Muzzleloader men will follow this rule at the trial, and no one can justly deny them their undoubted right to do so. They will not, of course, their rifles to shoot but a little powder (proportionally to the lead), because another late type of rifle does so. They will not permit of its showing poor shooting, when it can make good. This would be to pervert the very ends of the trial, and I am astonished that Mr. Leopold should bring this question into the foreground. "Straws tell which way the wind blows," and this is one of them. His proposition cannot be maintained in this kind of a trial any way it can be presented, and this matter, I think, had now best be dropped entirely.

Unless the target or cluster is to be the overruling question, then I deem "twenty shots" to be entirely unnecessary. Five shots will answer to get the trajectory very well. I know this from actual experience. The English, in their trial of '83, fired six shots only. It calls for much work to test many rifles, and twenty shots require too much time and labor to work out. Five minutes between shots is about right (I believe) and "twenty shots in thirty minutes is too rapid firing, it heats the barrel, etc.

I fully believe the editor of FOREST AND STREAM and his experienced experimenter, know just what to do and how to do it. I leave them to stand on their own bottom, for it is their right to do so. They embark in their own craft, and I believe they know full well how to sail it; and I heartily wish you success in your voyage.

This article will present some new and essential points to quite all of your readers, especially as to "weight" of rifles, "sights," "aiming," etc., and I think it will prove both interesting and instructive. In this light I offer it, and less to criticise than instruct.

MAJ. H. W. MERRILL.

Editor Forest and Stream:

In your issue of Aug. 6, I see that you state that you are to have a trial of rifles for trajectory, target, etc. That is excellent. I agree with you that the time has arrived when such a test should be made and something definite arrived at in regard to the shooting of our American rifles. There have been altogether too much guess-work and exaggeration so far; now then for the stern, solid facts of the case. Let us have them by all means.

I also notice in your issue of Aug. 13 that Major H. W. Merrill makes some suggestions in regard to the proposed test. After reading the Major's article carefully over, I have come to the conclusion that he is about right in his views regarding hunting rifles and how to correctly use them. I think that all old-experienced hunters and rifle shots will fully indorse the Major's views. Such has been my experience as far as it goes. I also notice in the same issue that Mr. E. A. Leopold makes some suggestions and invites criticism of the same. I can hardly agree with him that an arbitrary rule should be made, confining all rifles to certain limits of weight, sights, loads, trigger pull, etc. That is all very well in a competition where prizes are to be won, and it is intended to give all contestants an equal chance to win, but does not always show what the rifle can do. Again, I am not aware that there are any laws in this country to prohibit the hunter from using any kind of a rifle he pleases and how he pleases, in the pursuit of game. Also I would call attention to the facts that certain manufacturers of breechloading rifles in this country do make and put upon the market single-barreled rifles that weigh sixteen pounds or more each; also that the English rifle makers make a double rifle which weighs as high as twenty-four pounds. Therefore, such a rule as Mr. Leopold proposes would shut out many hunting rifles in use all over the world. In conclusion, have the trial by all means, let all come that want to, give all a fair, square, impartial trial, and may the best gun get the credit that belongs to it and no more. G. J. ROMER,

PEEKSKILL, N. Y.

Editor Forest and Stream:

I, for one, am very glad that you are about to institute a series of tests relating to the trajectories of American hunting rifles, and will venture to say that the result will be a tendency on the part of American manufacturers to make their respective arms with rifling of slower twist, lighter bullet than is now used, and heavier proportionate charge of powder. In your issue of Dec. 11, Mr. Roosevelt takes exception to my opinion of repeating rifles (published in FOREST AND STREAM Oct. 30) and thinks that they are preferable to the double-barreled express rifle for hunting purposes. I fully intended to have answered Mr. Roosevelt sooner, but I have been absent in the Northwest since the breaking out of the Riel rebellion, and have had no opportunity until the present. Take, for instance, the representative American repeating express (?) rifle, .500-caliber, 115 grains of powder and 300 grains of lead. My .500-caliber express rifle uses 150 grains of powder and a hollow-pointed bullet of pure lead weighing 375 grains, or a solid flat-pointed bullet hardened with quicksilver and weighing 400 grains.

Now, it is clearly evident that the last-named rifle will give a much flatter trajectory and possess greater killing power than the former. Therefore, it must be the most desirable for the use of the general sportsman. The same may be said of the .450-cal. repeaters. One hundred and fifteen grains of powder for a .500-cal. rifle is not an express charge. I think I am right in saying that the reason for this comparatively light charge is that it is difficult to construct mechanism in the receiver which will retract the bolt far enough to allow the use of a 3 or 3.25-inch shell. The only way of counteracting this is to use a shell which is excessively bottle-necked, and this causes greater recoil.

Mr. Roosevelt further says that the magazine gun is as much superior to the single or double breechloader as the breechloader is to the muzzleloader. It is, as far as the certainty of wounding one or more animals in a drove is concerned, and to this very attribute the slaughter of Western game is greatly due. I do not wish to be understood as saying that all sportsmen who use repeaters should be placed upon a level with the skinner; but the use of the weapon for hunting (or slaughter) which was originally intended for a military arm, has done irreparable mischief to the noble game of this country.

The use of the rifle for hunting requires considerable skill, and the call for a more deadly weapon among American sportsmen, as I understand it, is not for one which will enable one to kill without taking aim, or shoot as long as the game is in sight, but for one which will kill or disable when the bullet does strike, and not allow a wounded animal to escape and die miserably, or be pulled down by the wolves, and I know of no weapon which fulfills these requirements as well as the express rifle. I admire fine workmanship or an ingenious mechanical invention; but I fail to see that I am very antiquated in my views when I claim that the English express rifle—in the constituent qualities of which is embodied the essence of the experience of an army of good sportsmen, and which is constructed with regard to game shooting and no other—is superior to the repeater as now made, with its sharp twist, light charge of powder and consequent high trajectory, with low killing power. Of course, if the repeater could be made to use the express charge, and have the express rifling, it would be equal to the express in trajectory, and more than equal in the chances for repeated shots. I could and would be satisfied with a muzzleloader of from .35 to .40 caliber for game found this side of the Mississippi (using conical bullets for the large animals) if I were unable to own more than one rifle A moose will not paw off as much lead as an antelope.

I hope that some of the representative British manufacturers will send samples of their express rifles to you for the coming tests, in order that American sportsmen and readers of FOREST AND STREAM may see and understand the superiority of the express system for hunting rifles. I am not prejudiced or bigoted in my views above given, but simply state my experience and that of many other sportsmen that have hunted large game, and after trying nearly all of the popular arms, have adopted that which I consider to be the best for the purpose.

I should like to hear from your correspondent "C. D.," whose practical articles on this subject I enjoyed greatly. DEVIL'S RAMROD.

Editor Forest and Stream:

Like hundreds, no, probably thousands of others, I am delighted to see that you propose to have a trial of rifles. I have read the suggestions thus far offered you, and while they have been, in the main, good, they have filled me with a dread which your own statement of what you proposed to do, did not even suggest. It is that you will only try those rifles which are offered for trial by the manufacturers. I sincerely hope this dread is without cause. What we want (by we I mean the above mentioned hundreds or thousands) is a trial of the principal sporting rifles in the market, whether their manufacturers wish them tried or not. The manufacturers are nothing to us. We do not wish to advertise any of them. Neither do we wish them to be able to say, "Oh! our rifle was not tried by the FOREST AND STREAM, but other trials have shown that it will do better than any which were tried by them." Do things as well as you usually do. Give us a trial which is a trial, and we will have brains enough to use the information we receive, and to thank those from whom we receive it.

UTICA, N. Y. B. A. G.

Editor Forest and Stream:

I am delighted to hear of your intended trial of hunting rifles. In the last twenty years I have used no less than seven different rifles in the woods, a .50-cal. Express, .45-cal. Goverment, .40-cal. 90grs., .40-cal. 65grs., .38-cal. 55grs., .32-cal. and .22-cal. So you see I have spent some money in finding out what was required for the work to be done. I have come to this conclusion, that a .22-cal. for small game and, a .38-cal. Union Hill for deer shooting was what I wanted. As suggestions are in order, I would like to make three: First—That all rifles be shot from the shoulder, using such rests as may be necessary for accuracy, because of greater recoil of heavy charge of powder reducing the initial velocity below what it would be in a fixed rest. Second—All scores be shot through without cleaning. Third—Invite those great muzzleloaders that we have read so much about to take a hand. I.

Editor Forest and Stream:

The question of value not being taken into account in your expressed desire for "hints and suggestions" regarding a series of trajectory tests of different makes of hunting rifles, I am emboldened to offer a few, and let them go for what they may be worth. The first question to be decided is as to what is a hunting rifle proper? My answer is, such a rifle as an average man can carry all day without serious discomfort to himself, and of such a caliber as to be of available deadliness on all rifle game in the large majority of instances. I define rifle game to be all that larger class of game properly and generally beyond the range and power of the shotgun proper. I look upon the use of buckshot as a makeshift, which does not make a rifle of a shotgun in its results. Ten pounds is the most that the hunter ought to be called upon to carry for fourteen consecutive hours, to make his hunt pleasant. The caliber should not be less than .38 nor more than .50. The best for an "all around" gun is .40, a No. 6 shot will kill a deer, but how often? To sum up, let the maximum weight be 10lbs. The calibers not less than .38 nor more than .50. Each set of calibers to be fired 24 times each (after they have been sighted), by five different "crack shots," neither one knowing the results produced by the other till all are done; the guns to be wiped out for 12 of the shots and the other 12 not wiped. The average of each set of shots to be the ascertained trajectory under each of the two conditions. All shots to be from a muzzle rest. COMMON SENSE.

IOWA.

RANGE AND GALLERY.

BOSTON, Aug. 14.—To-day's shoot at Walnut Hill was well attended, and some fine scores were made. The weather condition was perfect toward the latter part of the day. Next Thursday the new long-range match will be shot.

Practice Match.

A Keach	4 4 4 5 5 4 4 5 5 5—45
C M Hodgdon	4 4 4 4 5 4 4 5 4 4—42
A H Wright (mil.)	5 3 4 4 5 4 3 5 5 4—42
E C B Erickson (mil.)	4 5 4 5 3 5 4 3 4 4—41
Herbert (mil.)	4 5 3 3 4 4 4 4 4 5—40

Decimal Off-Hand.

W D Palmer	6 9 10 10 10 8 9 8 10 7—87

JAMESTOWN, N. Y., Aug. 15.—Match with Waltham, Mass., seven men each, 200 ds., off-hand, Creedmoor target. The first seven scores for the team, the other two men shooting simply for the club medal and for practice:

Perry	4544335444—40	Jones	3435444544—40
Fenner	4445554454—44	Burns	3445555454—44
Ward	4400444404—28	Ayres	5454444554—44—285
Moore	5554445445—45		
Curtis	3343443445—36	Lonngren	4434444443—38

The Waltham Club shoot to-day and our club shot yesterday, telegraphing the scores this evening.—R. H. BURNS.

TOPEKA, Kansas, Aug. 14.—To-day the weekly rifle shoot of the Capital City Rifle Club took place on their range west of the fair grounds. The club is constantly growing in marksmanship and will soon be able to be classed among the leading clubs of the West. The target used is a Massachusetts decimal with a possible 100 points. The range is 200yds. and the shooting must be off-hand. The first score stood, first 10: R. Thompson 39, G. Morrison 34, H. P. Dillon 26, F. H. Martin 23, J. M. Clark 47, J. R. McCarter 40, J. T. Williams 38. Second score—R. Thompson 49, G. Morrison 60, H. P. Dillon 35, F. H. Martin 52, J. M. Clark 55, J. R. McCarter 44, J. T. Williams 36, J. H. Leonard 52. The shoot between a part of the German rifle team and 6 selected from the Capital City team will occur next Saturday, Aug. 22. This promises to be an interesting match as the 12 selected will represent the best marksmen in the clubs.

SUMMIT VS. SPRINGFIELD.—Rifle match shot between the champion rifle shots of Summit and Springfield, N. J., the Summit team consisting of the famous rifle squirrel shot, Paddy Ryan, and the mountaineer hunter, Geo. Pudney; the Springfield team composed of the old stand-bys, E. E. Miller and N. C. Jobs. Conditions, 25 shots each man at 25 and 50yds. respectively, off-naud, open sights, and Creedmoor targets and rules. Miller's score at 25yds. was 108 points out of a possible 125; at 50yds., 108 points also, total 216. Jobs at 25yds., 98 points, at 50yds., 103, total, 201. Ryan at 25yds., 99 points; at 50yds., 91 points, total, 190. Pudney at 25yds., 104 points; at 50yds., 105, total, 209. The grand total was Miller and Jobs 417 points against 399 of Ryan and Pudney of the Summit team, thus scoring an advantage of 18 points in favor of the Springfield team. Mr. Ryan was not feeling very well and his rifle seemed to sympathize with him, so that he proposes to have the match over again on some near future day.

BULL'S HEAD RIFLE CLUB, Aug. 7, 12-ring target, possible 120: C. F. Gensch 109, L. Bradfish 107, A. Sandlinger 100, H. Wasmuth 97, D. Loutzki 92, A. Liss 90, A. Shaw 85.

RIFLE NOTE.—The Canadian militia complain vigorously of the inferior quality of the ammunition furnished by the military authorities.

THE TRAP.

Correspondents who favor us with club scores are particularly requested to write on one side of the paper only.

FALMOUTH, Mass., Aug. 14.—The Falmouth Gun Club entertained on their grounds yesterday for an afternoon's sweepstake shooting the following members of the New Bedford Gun Club: Messrs. Plummer, Snow, Post, Butts, Smith, Cummings, Homer, Allen, Hussey, Stapelford and Kane. Mr. Butts, of the N. B.'s, holds the individual championship blackbird badge for Southern Massachusetts. A very high wind down the range was a financial benefit to the home club. Five clays, 5 angles, thrown low. 1.—Walker 1, Palmer 2, Snow 0, Post 3, Butts 4, Smith 2, Hussey 0, Cummings 1, Homer 1, G. W. Jones 3, Swift 5, Stapleford 1, Kane 0, Allen 4, W. B. Jones 0, J. H. Jones 2, Sargent 2, A. Jones 1, Harlow 3. Smith won first, Allen and Butts divided second. Jones and Smith third. 2.—Walker 3, Plummer 2, Snow 0, Post 3, Butts 2, Smith 3, Hussey 1, Cummings 1, Homer 3, G. W. Jones 3, Swift 3, Stapleford 1, Kane 1, Allen 4, W. B. Jones 0, J. H. Jones 3, Allen and Swift divided first, G. W. Jones and Smith second, Butts third. 3.—Plummer 3, Snow 2, Post 3, Butts 4, Smith 4, Hussey 1, Cummings 1, Homer 1, G. W. Jones 4, Swift 5, Stapleford 0, Kane 1, Allen 2. Swift first, Smith 2, Plummer third. 4.—Three pairs, 15yds.: Walker 2, Plummer 4, Snow 1, Post 4, Butts 5, Smith 3, Hussey 2, Cummings 2, Homer 1, G. W. Jones 3, Swift 4, Kane 1, Allen 2. Butts first, Post second, Smith and G. W. Jones third. 5.—Pair match, two men paired by lot: Smith and Jones 8, first, Butts and Kane, 6, second, Homer and Walker and Snow and Swift 5 each and divided third. 6.—Plummer 4, Snow 1, Post 3, Butts 4, Smith 3, Homer 1, G.W. Jones 1, Allen 5, Swift 4, Kane 0. Allen first, Swift second, Post third.

MACON, Ga., Aug. 11.—The inter-State shotgun and wing-shooting tournament now in progress here with a capital programme of sport at live pigeons, English sparrows, leather-wing bats, clays and balls. To-day there was a team shoot at clays well contested, the scores standing in it:

Chatham Gun Club—J. C. Manning, single 4, double 9; T. B. May, single 9, double 7; E. A. Crawford, single 6, double 7—42.

Forest City Gun Club—C. H. Sheftal single 4, double 6: John Rucker, single 8, double 5; Henry Rucker, single 4, double 9—36.

Harderville Gun Club—T. T. Hall, single 8, double 6; C. A. Williams, single 5, double 4; Thomas Martin, single 6, double 8—37.

Macon Sportsman Association No. 1.—A. L. Butts, single 2, double 6; L. D. Lockhardt, single 7, double 2; Asher Ayres, single 7, double 7—31.

Macon Sportsman Association No. 2.—John Jones, single 4, double 5; Charles Taylor, single 4, double 3; T. C. Etbridge, single 6, double 7—29.

National Association Team—W. W. Parker, single 6, double 6; A. J. Rust, single 6, double 10; W. R. Curtis, single 4, double 3—35.

Among other scores made during the day in the regular matches were the following:

Match No. 2—Globe flights:

S M Roach	01111 01 10—6	T B Mays	11101 11 01—7
J C Manning	11101 11 10—7	E A Crawford	10010 00 10—3
Thos Martin	10010 11 10—6	I C Williams	00000 11 10—3
H Rucker	10111 10 00—5	J Rucker	10111 11 11—8
J L Cook	00101 11 01—5	Asher Ayres	10111 11 00—6
Chas Taylor	11100 11 11—7	A I Rust	01010 10 11—5
J C Jones	01010 00 11—4	T T Hall	11010 11 10—6
G S McAlpine	10111 01 11—7		

Rucker first, Taylor second, Martin third.

Match No. 4, clay-pigeons—T. Martin 7, A. Ayers 8, A. J. Rust 8, A. L. Butts 5, T. T. Hall 9, John Rucker 8, H. C. Hill 5, J. S. McAlpin 5, J. C. Manning 5, P. B. Mays 6, W. Rucker 6.

Match No. 6, extra, clay-pigeons, doubles:

T Martin	11 10 10—4	P B Mays	10 11 11—5
D B Mays	11 11 11—6	J Roach	01 11 10—4
G S McAlpin	10 10 11—4	Thomas Martin	11 11 11—6
A J Rust	11 01 10—4	E A Crawford	11 11 10—5
W W Perdix	11 01 11—5		

BLAIR, Nebraska, Aug. 12.—A shooting tournament was held at the Independent Gun Club's grouads at this city on yesterday, under the auspices of the Blair Gun Club, and participated in by clubs from Tekamah and an expert from Illinois. Following is the score at 10 glass balls, 18yds. rise:

W Humphries	0001101001—4	J E Merriam	1101110111—8
F H Claridge	1101011101—7	G Cachelin	1001311010—6
F O Paulger	0110111111—8	A White	1011101101—7
F H Lee	0111111111—9	J Keppell	1110111111—9
F Beard	1111111011—9	C E Atwater	1101110111—8
C E Bardwell	1111001111—8		

Ties on first: Lee 5, Beard 5, Keppell 0, Lee and Beard divide. Ties on second: Paulger 3, Bardwell 5, Merriam 4, Atwater 4, Claridge and White divide third.

Second, at 7 birds, 25yds. rise:

Humphries	1000111—4	Atwater	0101010—3
Keppell	1110110—5	Cachelin	1101111—6
White	0111111—6	J Barton	0001111—4
Paulger	0011101—4	Bardwell	1101110—5
Claridge	1000011—3	L Warrick	1111011—6
Beard	0111111—6	Lee	0111110—5

Ties on first: White 1, Cachelin 2, Beard 3, Warrick 2. Ties on second: Keppell 2, Lee 2, Bardwell 3. Ties on third, miss and out: Humphries 5, Paulger 0, Barton 6.

Third, at 7 clay-pigeons, 18yds. rise:

Paulger	0001011—3	Atwater	1110110—5
Beard	1000101—3	Humphries	1011010—4
White	1111110—6	Geo Thompson	0010011—3
Bardwell	1100101—4	Lee	0001011—3
Claridge	1111110—6	Barton	1111010—5
Cachelin	0101000—2		

Ties on first, 20yds.: White 1, Claridge 2. Atwater and Barton divide second and Bardwell and Humphries divide third.

Fourth, at 5 birds, 25yds. rise: Cachelin 5, E. A. Palmer 2, Thompson 2, White 4, Atwater 3, Barton 3, Keppel 1, Humphries 4, Bardwell 3, Claridge 4, E. F. Cook 5, Beard 3, Lee 2. Cook and Cachelin divide first, White won second, Beard won third.

Fifth, at 5 doubles (1 glass ball and 1 clay-pigeon), 15yds. rise:

Bardwell	11 11 10 11 10—8	Lee	10 11 10 10 10—6
Barton	01 10 01 11 11—7	M D Bedal	11 11 11 00 11—8
Claridge	01 11 11 01 00—6	Cachelin	11 10 10 00 10—5
Humphries	11 10 01 10 00—5	Beard	11 11 10 11 00—7
Atwater	10 01 10 10 11—6	Merriam	10 11 11 11 01—8
White	11 10 01 11 11—8		

Bardwell and Merriam divide first, Beard won second, Claridge won third.

Sixth, at 10 glass balls, 18yds. rise: Palmer 9, Cachelin 6, Atwater 7, Claridge 5, Merriam 4, Bedal 5, Bardwell 7, White 7, Lee 6, Thompson 6, Beard 8, Humphries 4, Keppell 5. Palmer won first, Beard won second, and Atwater, Bardwell and White divide third.

Seventh, at 7 clay-pigeons, 18yds. rise: Bardwell 5, Merriam 5, White 6, Atwater 6, Beard 6, Humphries 4, Claridge 0, Cook 7, Lee 3. Cook won first. White, Atwater and Beard divided second, and Bardwell and Merriam divided third.—ED. F. COOK, Secretary I. G. C.

BOSTON GUN CLUB.—Prize and practice shoot at Wellington, Mass., Aug. 14.—A few of the members of the Boston Gun Club assembled on the grounds at Wellington, Mass. This was the fourth shoot for the elegant prize list put out by the club. A good strong wind was blowing, and the birds being sent 65 to 85yds. from the trap, made it difficult shooting. The result for the day's shooting was: Snow and Ward tied for first prize, followed closely by Spencer, Miles, Mitchell and Philbrick. Following are the separate events: First event, 7 singles, 1 trap, 18yds.: Holden first, W. A. Spencer, G. F. Cutting and J. S. Snow divided second, J. Philbrick and J. Smith, third. Second event, 7 singles: J. Snow first, Spencer second, Holden and Smith third. Third event, 7 birds; Snow first, Spencer second, Philbrick and Cutting third. Fourth event, 7 singles: Spencer first, Snow second, Philbrick third. Fifth event, 7 birds: Snow first, Spencer second, Philbrick third. Sixth event, 7 birds, Spencer first, Philbrick and Snow second. Seventh event, 7 singles: Snow and Holden first, Spencer and Mitchell divided second, Philbrick third. Eighth event, 7 birds: Philbrick won first, Cutting and Mitchell second, Holden and Spencer won third.

KINGSTON, N. J., Aug. 10.—Kingston Gunning Club match at clay-birds, screened trap, 4th notch, 18yds., for silver club badge:

J Stryker	1111111111—10	W W Van Duyn	0101111010—5
C H McDonald	1111111111— 9	C Smith	1010110100—5
E Lichenor	1111110111— 9	J Blackwell	1010010011—6
G Snook	1101010111— 7	E Stout	1111010000—5

After the match the following officers were elected for six months: President, C. H. McDonald; Treasurer, J. Stryker; Secretary, J. Lichenor.

BOSTON, Aug. 11.—The attendance of shotgun admirers at the Walnut Hill Range to-day was fair. The Massachusetts rifle team carried away the first prize. Mr. J. N. Frye's score of 20 out of a possible 21 on the team match has never been beaten on this range. Following are the results of the different events:

Team Match.

Mass. Rifle Association—1st Team	10 singles.	3 pairs.	5 clays	Pow-Wow Gun Club.	10 singles.	3 pairs.	5 clays
Stanton	10	4	3	Eastman	9	3	3
Law	10	4	4	Rowell	9	4	4
Snow	6	5	5	Lovering	5	3	4
Totals	26	13	11—50	Totals	23	10	11—44
Mass. Rifle Association—3d Team				Malden Gun Club.			
Souther	6	2	4	Brown	8	3	4
Williams	7	5	5	Warren	9	3	2
Nichols	9	6	5	Edwards	6	4	2
Totals	22	13	14—49	Totals	23	10	8—41
Mass. Rifle Association—2d Team				Lowell Rod and Gun Club.			
Dickey	7	5	5	Knowles	9	3	3
Curtis	8	5	3	Piper	7	2	1
Tidsbury	9	6	5	Lovejoy	8	3	4
Totals	23	13	12—48	Totals	24	8	8—40

Individual badges were won by Tidsbury, Dickey, Stanton and Knowles, and they will hold badges A, B, C and D respectively.

KNOXVILLE, Tenn., Aug. 14.—Knoxville Gun Club gold medal match, 3 traps; 15yds. rise, 3 angles, at blackbirds:

C Deaderick, 18yds ..... 111100111101001100111110—17

J B Kelly	000100000011010— 3	Ameer Scrub	111110011000010— 8

Ross won in the shoot off.

CLINTON, Aug. 14.—On the grounds of the Clinton Sportsman's Club there was a contest to-day for the individual New England blackbird championship medal, 12 singles and 6 pair birds; Eager—singles 10, doubles 10; Webber—singles 10, doubles 3; Sampson—singles 7, doubles 1. Webber and Sampson withdrew on doubles after shooting 6 times each. Eager having won the badge 3 times out of 5 matches it now becomes his individual property.

NATIONAL GUN ASSOCIATION TOURNAMENTS.—Special Notice.—Members desirous of organizing tournaments in their vicinity, under the auspices of the Association, are requested to notify the undersigned. All the expenses of the same will be paid by us. Make your arrangements for 1886. We propose to establish a circuit of tournaments annually. Claim your dates now.—F. C. BISHOP, Secretary, Box 1292, Cincinnati, O. Send 10 cents for hand book containing rules, constitution, etc. "Fairly started and its future depends entirely upon the manner in which the sportsmen throughout the country respond."—C. M. STARK, April 18, 1885.—*Adv.*

FIXTURES.

Aug. 15-30—Quaker City Y. C., Annual Cruise, Delaware and Chesapeake Bays.
Aug. 20, 22 and 24—Trial Races, N. Y. Y. C. Course.
Aug. 20—Toledo Y. C., Third Club Regatta.
Aug. 22—Corinthian Y. C., Third Championship.
Aug. 22—Larchmont Y. C., Oyster Boat Race.
Aug. 24 and 25—Michigan Y. C., Regatta at Lake St. Clair.
Aug. 25—Michigan Y. C., Open Inter-Lake Regatta.
Aug. 25—Pentucket Y. C., Club Race.
Aug. 26—Greenwich Y. C., Annual Regrita
Aug. 29—Quincy Y. C., Third Club Race.
Aug. 29—Beverly Y. C., Swampscott. Third Championship Regatta
Sept. 5—Hull Y. C., Champion Race.
Sept. 5—Larchmont Y. C., Fall Pennant Regatta.
Sept. 7, 9, 11—America Cup Races.
Sept. 7, 9, 14—America Cup Races.
Sept. 9—Beverly Y. C., Nahant, Fall Regatta.
Sept. 12—Quincy Y. C., Third Championship Race.
Sept. 12—Boston Y. C., Fourth Club Race.
Sept. 12—Corinthian Y. C., Fall Matches.
Sept. 14—Newark Y. C., Open Regatta.
Sept. 15—N. Y. Y. C., Bennett and Douglas Cups.
Sept. 17—N. Y. Y. C., Brenton's Cup Race.
Sept. 19—Beverly Y. C., Nahant.
Sept. 19—Hull Y. C., Champion Race.
Sept. 19—Pentucket Y. C., Union Regatta.
Sept. 22—N. Y. Y. C., Cape May Cup Race.
Sept. 28—Pentucket Y. C., Championship Regatta.

THE TRIAL RACES.

THE following programme for the races has been issued by the Regatta Committee:

"The yachts entered for these trial contests must be hove to in the immediate neighborhood of buoy No. 18, in the upper bay, on the morning of the races over the club course one-half hour before the time appointed for the start, and on the morning of the races outside of Sandy Hook they must be hove to or at anchor off the government dock in Sandy Hook Bay one hour previous to the time appointed for the start, and each yacht must be ready to send a boat with the representative of the yacht aboard of the judges' boat to receive instructions. The place of starting for the outside races will be from the Scotland or the Sandy Hook Lightship, according to the direction of the wind, and failing verbal directions the yachts will proceed to whichever point is signaled from the judges' boat. The International Code flag 'B' will signify the Scotland Lightship and 'D' will signify the Sandy Hook Lightship. 'G' will signify that the course will be triangular and 'J' will signify that the course will be twenty miles to windward or leeward and return.

"In the outside races, at the start and the finish, the competing yachts must pass between the judges' boat and the lightship, and in the triangular race, when rounding the marks, they will keep outside of the stakeboats or buoys used to designate the course. In the windward or leeward race, the yachts will keep the outer mark on the starboard hand.

"Buoys displaying red flags will be used to mark the courses and the turning points of the outside course, and the buoys, and not the tugboats, are to be turned. When the tug or judges' boat is running off a course she will display no flags until she has reached the mark, when she will display the New York Y. C. flag alone, and keep it flying as long as she remains at the mark.

"The rules of the New York Y. C., including those for time allowance, will govern these contests, and the sailings directions are as follows:

"Yachts while sailing must carry their private signals at the main peak. The signal for starting will be as follows: Preparatory signal—one long blast of the steam whistle on the judges' boat, and at the same time the United States ensign will be lowered from the bow staff and a Blue Peter set in its place. Five minutes after there will be a second blast of the steam whistle from the judges' boat, and the Blue Peter will be lowered and the New York Y. C. signal set in its place, when the time of each yacht will be taken as it crosses the line.

"Two minutes later there will be a third blast of the steam whistle given, and this time shall be recorded as the time of any yacht starting thereafter.

"The necessary particulars as to the outside courses will be given on the morning of each race.

"In the race over the club course yachts in starting will cross an imaginary line drawn from the judges' boat to buoy No. 18, opposite Owl's Head, L. I.; thence (keeping outside of Fort Lafayette) to and around buoy No. 10, passing to the west and south of it; thence to buoy No. 8½, passing south of it and north of buoy No. 5, off the point of Sandy Hook, to and around Sandy Hook Lightship, turning it from north and east, and then return over the same course to the westward of the home stakeboat, which will be anchored abreast of and to the eastward of buoy No. 15. All yachts must pass to the eastward of West Bank buoys Nos. 9, 11, 13 and 15, and to the westward of red buoys Nos. 10½, 12, 14 and 16, both going out and returning home. These races must be made in seven hours. Special attention, too, is called to the fact that these races are for the purpose of finding out which is the fastest yacht, and those in charge of the competing yachts are expected to do their best to further the end in view, both in the spirit and the letter, avoiding interfering, as far as possible, with other competing yachts.

"The races will be started on each day at 10:30 A. M.

"The first race will take place on Thursday, Aug. 20, over an outside course.

"The second race will be sailed on Saturday, Aug. 22, and also over an outside course.

"The third race will be sailed on Monday, Aug. 24, over the New York Y. C. course, and if further races are necessary they will be sailed on succeeding or alternate days, according to circumstances, as the committee on the America's Cup of the N. Y. Y. C. may direct."

J. F. TAMS,
C. H. STEBBINS,
J. A. MONTANT,
Regatta Committee.

NEW YORK, Aug. 17, 1885.

PRISCILLA.

AFTER her return from Newport Priscilla went directly to Poillon's yard, where her mast was lifted out and taken ashore. A piece 5ft. 3in. long was cut off the heel, to compensate for which a longer topmast was added. Her masthead was protected by iron plates at each corner under the eyes of the rigging, but these were twisted by the heavy strain and the wood underneath them was crushed considerably. The bracket from which the throat halliard was hung had also pressed into the wood in spite of the iron straps. An iron funnel has been placed over the masthead to take the strain off the shrouds. Two openings have been cut in each of her channel plates to lessen the drag. On hauling out her bottom was found to be in very bad condition, the paint being badly blistered. She has been scraped smooth and potleaded, and will be much better in respect to bottom than she has yet been. Her topsides have been painted and a gold stripe added, which materially improves her appearance.

NEW YORK Y. C. CUPS.

BESIDE the races for the America's Cup it is probable that other races will be sailed for the four cups now in possession of the club. These are the Cape May cup, for sloops and schooners, without allowance, over a course from Sandy Hook to Five Fathom Lightship off Cape May and return; the Brenton's Reef cup, also without allowance for size or rig, from Sandy Hook around Brenton's Reef Lightship and return; and the two cups for schooners and sloops, presented by Com. Bennett and Vice-Com. Douglas, for sloops and cutters only, over an outside triangular course, with allowance. The date of Sept. 15 has been set for the latter race, Sept. 17 for the Brenton's Reef race, and Sept. 22 for the Cape May race. No entries have yet been made for any of these races but it is probable that Genesta will enter and also the larger sloops, cutters and schooners. None of the races filled last season and the races were not sailed, but the presence of Genesta this year has brought things to racing pitch and there will in all probability be some fine sport after the Cup races. These four cups have been in the club lockers long enough, and it speaks little for the spirit of owners when they go begging and the entries do not fill.

PURITAN.

THE Boston sloop has been for a week in New York Bay sailing over the course and trying new sails. On Monday she hauled out at the screw dock for cleaning and painting. Her wooden bottom is yet new and very rough, but it has been smoothed off and potleaded carefully, showing her white sides in bold contrast. About 1900 pounds of lead have been run into her keel as fast as possible, allowing some of the inside weight to be dispensed with. Hundreds of persons have visited the screw dock in the past few days to see the boat, most of them also visiting the Priscilla, hauled out further up the street. Comments have been passed on the white sloop by yachtsmen, sailors, builders, sailmakers and boating men of all shades of opinion, from the ultra cutter to the sandbagger, but nearly all are favorable to the white boat. She certainly is a surprise to all, differing from anything known to New York yachtsmen in her harmonious combination of many diverse features. A centerboard sloop she undoubtedly is, but apart from her beam it would be saying a good deal to deny that there is more cutter than sloop in her, both in model, rig and fittings. Her designer has copied nothing blindly, but has been wonderfully happy in his selection and adaptation of the features of sloop and cutter. She will be ready in good time for Thursday's race.

ANNISQUAM REGATTA, AUG. 14.

THE Cape Ann Y. C. sailed an open regatta on the Annisquam River, in which thirty-seven yachts competed, all being under 26ft. The course for the first and second class was from a line between the stakeboat off John Hodgkins's cafe and Russ Island, down the river to Black Buoy on Squam Bar and turn the buoy; then up the river to a stakeboat off Prison's Point in Little River, thence to the starting point, distance, eight miles. And for third class was from Russ Island up Little River to a stakeboat off Prison Point, thence down the river to the stone beacon off Annisquam, thence up the river to the starting line; distance, seven miles. A start was made at 2:05 P. M. for first class, 2:15 for second, and 2:25 for third, nine yachts starting in the first class, nine in the second, and eleven in the third. The times were:

	Length.	Actual.	Corrected.
FIRST CLASS.			
Black Cloud, Brown	23.00	1 56 42	1 29 12
Adele, Haskell	21.04	2 01 17	1 40 13
Kitt wake, Cunningham	20 09	2 11 29	1 41 37
Venus, McKenzie	24.01	2 16 44	1 50 15
Fatinitza, Thomas	20.05	2 17 34	1 46 20
Jalma, Proctor	21 07	2 22 59	1 54 02
SECOND CLASS.			
Sassacus, Griffin	16 08	1 59 04	1 23 54
Puritan, Tucker	17.05	2 07 12	1 33 08
Spark, Gaffney	16.11	2 15 06	1 40 26
Eusymone, James	19.10	2 17 22	1 46 26
THIRD CLASS.			
Owl, Davis	14.08	2 13 08	1 39 30
Dione, Hodgkins	16.05	2 10 33	1 39 40
Nancy D., Oakes	15.05	2 12 54	1 40 24

Black Cloud wins first prize, $12; Adele, $10; Kittewake, $8. In second class the winners were Sassacus, $10; Puritan, $5; and in third class, Owl, $6; Dione, $3.

The regatta committee were William J. Maddocks, Geo. H. Proctor and John S. Presson. The judges were H. Frank Sanford, William J. Maddocks and M. Herbert Nichols.

QUINCY Y. C., AUG. 14.

THE second championship regatta of the Quincy Y. C. was sailed on Aug. 14, off Meare's Beach in a reefing breeze from southeast, over the club course. In the first class Queen Mab and Erin made a close race for a time, but the former finally won easily, taking Com. Adam's championship pennant for the second time. Diadem led the second class for a time but Niobe finally passed her. Flora Lee, in third class, outsailed the entire second class.

	Length.	Actual.	Corrected.
FIRST CLASS.			
Queen Mab, E. L. Burwell	22.08	1 37 11	1 09 21
Erin, John Cavanagh	27.02	1 51 09	1 27 17
SECOND CLASS.			
Niobe, J. E. Sayles	20.06	1 17 05	0 50 43
Mabel, Geo. R. Howe	20.05	1 19 38	0 53 11
Tartar, F. Dunne	20.00	1 21 15	0 51 22
Nereid, C. F. Colby	20.10	1 23 17	0 57 14
Diadem, L. Hayward	18.07	1 25 50	0 59 25
Wildfire, H. A. Keith	18.01	1 27 15	0 58 15
Posy, Bumpus & Crane	20.05	1 25 31	0 59 04
Pet, J. McFarland	20.01	1 26 35	0 59 48
Christine, George F. Russell	19.00	1 27 45	0 59 48
Spray, Henry M. Faxon	19 04	1 27 51	1 00 16
Maisie, J. H. Slade	20.00	1 30 20	1 03 27
THIRD CLASS.			
Flora Lee, D. H. Lincoln	17.03	1 11 16	0 45 33
Elfin, J. F. Culley	16.08	1 25 35	0 59 13
Guenn, W. L. Dearborn	17.10	1 24 55	0 59 28
Elsie, C. F. Hardwick	16.09	1 25 53	0 49 35
Mischief, D. W. Belcher	16.10	1 26 25	1 00 15
Undine, H. French	17.03	Not taken.	

The judges were Peter B. Turner, W. T. Babcock and ex-Commodore George W. Morton. The judges' boat was Captain Veader's yacht Water Lily.

Niobe wins one leg for the second class pennant, besides first prize. Mabel takes second prize, Flora Lee takes the pennant.

THE RACES OF THE NEW YORK Y. C. CRUISE.

THE annual cruise of the New York Y. C. and the accompanying races have this year possessed a new feature, that has completely overshadowed all others, and has attracted more attention than any issue that has been before the yachting world in many years. There was once a time when the fleet was composed almost entirely of schooners, or at least when the interest centered entirely in the schooner racing, following which came the sloops of 60 to 70ft. waterline, their contests becoming more important each year as the interest in the schooners waned, while at the same time the 50ft. class of sloops added their share to the sport. Within the past five years the advent of the cutter and the warm controversy over keel or board has made the contests between the larger single-stickers by far the most important feature of the races, those between the larger schooners, keel and centerboard, attracting much less attention.

For the past five years the names most prominent in the events about Newport have been Mischief, Gracie, Bedouin, Wenonah, Fanny, Ileen, Hildegarde, Vision and Arrow, the greater glory being divided among them, next to which the contests of Fortuna with Montauk and Grayling claimed a place. Not only has less interest than usual been felt in the performances of these boats this season, but none of them have acquitted themselves as creditably as heretofore, and what they have done has excited but little attention compared with the races of two boats of an entirely new class. Large schooners and moderate sized sloops and cutters have both, for a time, had their day, and for this season at least a new style of craft engrosses the attention of all yachtsmen, and their duels have completely dwarfed the racing of the other yachts.

Both the new yachts have been described in detail in FOREST AND STREAM, but before looking at their performances a closer comparison of their individual points will be of interest, especially as they meet again this week in a series of still more important races. Broadly speaking, both are centerboard sloops, but in view of the imported innovations and unpatriotic improvements that have crept into American practice within a few years past such definition gives little idea of their model, rig or equipment. Looking first at the hulls Priscilla more closely follows American ideas. Both yachts have relatively great beam and moderate depth as distinguished from the cutter type, but on the other hand the beam is much less than that commonly given to American sloops, while the depth is proportionately greater. In sheer and freeboard also there is a marked difference, both of the new boats having less of the former and more of the latter than any of their smaller predecessors. In this respect the Priscilla with her straight sheer increased in appearance by the plain black side from waterline to rail, unbroken by plank sheer or gold stripe, as well as by her short angular counter, resembles more the cutters we are familiar with here, while the Puritan follows more closely the sloop, having a fair and graceful sweep from knighthead to taffrail, heightened in effect by a wide gilt band below the plank-sheer, adding greatly to her appearance. On the other hand in the matter of beam the Boston boat has actually the same amount with a shorter length, making her a proportionately wider boat. Both boats have the plumb stem once so rare among our sloops, but now too common to excite special notice, while aft they differ greatly. The Priscilla has a short thick counter, far from handsome in itself and aggravating the effect of the high side, giving a stumpy and heavy look to the after part of the boat, while the Puritan has the long overhang of the thorough cutter, light, graceful and adding immensely to the finish of her after body.

Most of these features are apparent to the eye, and are perhaps more matters of taste than of vital importance, but there is another point not visible on inspection afloat, in which the two yachts differ most materially. Although the Priscilla is built of iron and the Puritan of wood, their displacement and weight of ballast do not vary greatly, but in the manner in which the latter is disposed of lies the main point of difference between them. The iron boat has her lead, some 45 tons, stowed inside hanging on the frames, while the wooden boat has 25 tons beneath her in the shape of a large outside keel through which her centerboard works, her remaining 20 tons being disposed of inside. Another point of difference in this connection is that while Priscilla's hull is carried down nearly to her full depth, with a keel only 5x3in. outside, Puritan, with the same draft, has less depth of hull and a much deeper and wider keel, the latter being 15in. on bottom.

Within the half dozen years that outside, or more properly low ballast, has been common with us, it has been tried on all forms of yachts and with uniformly good results, except in one class of boat, where it was joined with wide beam and moderate or small depth, in which case, while there has been a gain in stiffness and sail-carrying power, the speed of the boat in rough water has in some cases been seriously impeded owing to her violent motions. From the experience in these cases, it has been feared by some that while very stiff and fast in smooth water, the Puritan would feel the strain of the low weight in a sea, but judging by her behavior in the rough weather of Aug. 3, no such results need be apprehended in her case, as she not only stood up and sailed very fast, but her motion was easy considering the sea running. Still one point of difference remains between them, the Priscilla has the vertical sternpost of the sloop, while the Puritan's rakes well aft as in the cutter, the latter's keel also having a rocker with its greatest depth amidships, while Priscilla's is straighter, with the depth at the heel of the sternpost.

It will be seen then that while both are really American centerboard sloops, they differ in model from the boats so long known by that name, having little in common with Fannie, Gracie, Arrow and others of their time. Again comparing them with each other, the Puritan, in the matter of keel and low weight, as well as in the long counter and raking sternpost, resembles the cutter, while the corresponding features in the Priscilla are those of the sloop.

No less important than the hull and ballast is the rig, and in this point a marked difference exists between the two boats. Priscilla's rig is neither sloop nor cutter, but a cross between the two; while Puritan has, with two exceptions, the full cutter rig. In proportions of sails and spars, Priscilla's rig is that of a sloop with double headsails, her mast being very long with a short topmast, while her gaff is short in proportion, the entire rig being lofty and narrow. Her mainsail is laced to the boom, her bowsprit is fixed and the jib is set on a fixed stay, so that the rig may be called that of a sloop as the term is now understood. Looking at the details, however, the back stays, runners, quarter lifts and similar gear, though found on many sloops, are essentially part of the cutter rig, while the traveler on her boom and the entire fittings of the masthead claim the same origin. Puritan's rig is planned more nearly on the proportions of the cutter, and with the exception of a laced mainsail and a fixed bowsprit, the details are entirely so. The jib is set flying with an outhaul on the bowsprit, several sizes being provided, as in a cutter, the mast is comparatively short, with a long topmast, the area of sail is low and long, and all the minor details are parts of the regular cutter rig.

The purpose for which these two yachts have been built is generally known to be to provide a better yacht than any of the old ones to meet Genesta and possibly Galatea, and to this end a series of trial races had been arranged to take place after the cruise, consequently the main feature of the week's racing was the fight between these two big ones, something that we may not see again in some years. Built for a special purpose, they are of a size that will hardly become popular here for the sloop rig, and unless some new occasion arises they will both, in all probability, be converted into schooners after the races, leaving our sloop class as before, 70ft. and under.

Prior to the cruise the pair had not met, one being built in Boston and one in Wilmington and New York; and while the former had sailed one successful race and had been well tried, the latter had not raced, though under sail for a month previous.

The first day of the race saw Priscilla alone with the fleet on the run from the rendezvous at Glen Cove to New London, 90 miles, a scrub race to windward, in which no prizes were offered, but all did their best. Against her were Bedouin, Ileen, Gracie, Arrow and Mischief. Starting at 5:30 A. M., they all went off closely together, with a topsail breeze or rather more from N.E. The tide was against the fleet as they tacked out, Priscilla soon being first. After a couple of hours she was well ahead, with Gracie second, Bedouin and the schooner Grayling next to her. In the calm that followed she still kept her lead, and when near New London was still ahead. Meanwhile Grayling passed Gracie and finally Bedouin passed both, taking second place to Priscilla. Montauk and all the others were far astern. Entering New London Bedouin was very close to the new sloop, and as the latter grounded she passed her, being first boat in. Grayling came next and then Gracie, while the Priscilla was hauled off by a steamer, the Osprey. Mischief came in during the night and the rest in the early morning. Of the schooners, Grayling in the light weather was far and away the best, leaving all. But the times of the boats were taken on their arrival, but are not correct, as Bedouin was first instead of third. But for grounding Priscilla would have beaten her by only a few minutes, and while the fluky weather precluded any real test, the race, such as it was, gave little advantage to Priscilla over Bedouin or Gracie.

In New London harbor was the white yacht on which Boston had pinned her hopes, clean-lined, staunch and handsome, and thus far with a successful record to back her. The race of 45 miles from New London to Newport, on Aug. 8, was sailed in a S. E. wind, light enough for jibtopsails, a wind that served all alike with little flukings. The times of start and finish were both taken, by which Puritan beats Priscilla 34 seconds, but the latter claims a delay of several minutes for the purpose of starting even with Puritan. When off Watch Hill Grayling led, with Priscilla, Puritan and Gracie in order. Puritan lost some time through her jibtopsail tearing, and later on was blanketed by the sloop Fanny, which was not in the race but came

out to meet the fleet, tacking directly on Puritan's weather bow and taking her wind. All things considered honors were about even between the two new boats on this their first trial, a race in smooth water and light winds, and while the times show a victory for Puritan it is very small. What is more important is that she beat Gracie by 16 min., Bedouin by 17 min., Mischief by half an hour and Grayling and Montauk by 6 and 7 minutes, according to which showing both of the new boats were considerably faster than the old on corrected time. As if Puritan's success were not enough, Boston secured a second victory when Fortuna beat both of her old rivals, Montauk and Grayling, in light winds and smooth water.

The chief event of the cruise was, of course, the race for the Goelet Cups, no mere drift nor fluking match, but a heavy weather contest that sent home half a dozen wrecks and made the winners work hard for their prizes. The wind was strong from S. E. with a heavy sea; in fact the best idea of the weather may be gained from the casualties. Many of the entries did not start, and of those that did Gracie and Grayling soon felt tired and came back. Dauntless and Wanderer carried away their gaffs, the mainsail of the former breaking in two, Mohican lost her foremast, masthead and jibboom, and was generally wrecked in her rigging, Stranger suffered sorely in rigging, Clio snapped her jib stay and Bedouin lost her bowsprit short off. Neither Isis, Athlon nor Stranger crossed the finish line. In this weather Puritan sailed a splendid race, beating her opponent fairly and squarely ten minutes on even time. With her weight outside and snug rig, Puritan walked away to windward, while Priscilla was punished by her heavy mast and lagged behind. The only single stick boat that made any show was Bedouin. Handicapped at the start, she had gained a good place and was carrying her topsail when her bowsprit gave way, disabling her completely. Of the schooners Fortuna and Montauk were left to fight it out alone, and in the heavy weather the grand qualities of the keel boat showed themselves, as she carried her topsail through the worst part of the race, while her rival was under lower sail only. The double victory went to Boston, and no one could deny that it went fairly.

Three other sails followed before the fleet disbanded, but though valuable for comparison, they were all of the nature of scrub races, and in no way equal to the race of Monday. On Aug. 5 the fleet left Newport for New Bedford, a run of thirty miles, with a foul tide over the first part of the course and smooth water except for a long roll to the sea, a reminder of Monday's turmoil. A good wind from the south came on the beam for a time and then dead aft, and all light stuff was set to catch it. The single-stick boats were Puritan, Priscilla, Gracie, Mischief, Athlon, Hesper, Isis, Vixen, Whileaway and Regina, while the schooner fleet numbered Grayling, Fortuna, Clytie, Nirvana, Dreadnaught, Estelle, Speranza, Norna, Princess, Dauntless, Clio, Marion Wentworth, Atalanta, Norseman, Wave Crest and Madeleine. In company at the start were Genesta and Stranger, the former under plain sail with a boat towing. Neither crossed the line, but both sailed with the fleet for a time, making no great exertions to keep up. Starting with a beam wind, Priscilla led Puritan, increasing her lead when the latter's balloon jibtopsail split and she was forced to take it in, while Gracie was well up in the van. Grayling had the best of the schooners in this light weather and won easily. The result of the race was that Priscilla beat Puritan by 1min. 16sec. elapsed time and 9min. 52sec. corrected, but further Gracie was but 9min, 14sec. astern of Priscilla, or 1min, 33sec. ahead of her in corrected time, while she led Puritan by 2min. even time, such a victory as Gracie has not scored before in a long while. Mischief, the only other one of her class, was 12min. astern of her, a place where she has seldom been found of late years, and to deduce any conclusions as to the speed of the four boats from these times would be a difficult matter. Suffice it to say that for once Priscilla outsailed the white sloop fairly, though the accident to the latter's sail delayed her some. Grayling arrived on even terms with Puritan, both Clytie and Nirvana hunting her closely and sailing well all day.

Next day saw another victory for Priscilla, though one that by no means proves that she is as fast as Puritan. Of course, a race is a race, and every boat must stand by its own accidents, breakdowns, as a rule, being perhaps the legitimate results of defective work or undue carrying on; but here we are not looking for final results, but for a comparison of the powers of two boats, and it is only fair to consider an accident, especially when of the only class for which there is a good excuse, the breaking of forged iron work from a hidden flaw. The course was short, only 25 miles, the wind fresh astern for a time with sheets in close at the last. Puritan led down wind and was well ahead of Priscilla when the windward work began, but when the race was half over, the iron link connecting the throat halliard block and the gaff broke and the throat fell. The sail was lowered and the damage repaired; but ten minutes were lost, in which time Priscilla was just even with her. The race started a second time and again Puritan beat, coming in 28s. ahead. The elapsed time shows 2m. 44s. in Priscilla's favor, or 1m. 20s. corrected; but allowing for the time lost by Puritan, it was really a victory for the latter. The schooner fleet was entirely changed in this race, the starters being: Clytie, Clio, Wave Crest, Wanderer, Norna, Princess, Dauntless, America, Dreadnaught, Speranza and Marion Wentworth, and this time the older ones showed up ahead, Dreadnaught winning, with America a close second, the rest well astern.

The last day of the cruise saw a race over the 40 miles from Vineyard Haven to Newport, starting to windward in a light breeze, then a long drift in a calm, and ending in a run with spinnakers before a good breeze into Newport; but on or off the wind, sailing or drifting, in light airs and stronger breezes, the white sloop showed her power, and finally beat the iron boat by nearly 7m. even time. Only Isis accompanied them, and the schooners had dwindled down to Dreadnaught, Fortuna, Norseman and Clytie. Norseman won with Fortuna 4m. astern.

In seeking to measure these performances of the new sloops by an established standard the name of Bedouin at once suggests itself as the leading yacht of later years and by odds the best, while of the schooners in ordinary weather Grayling certainly takes first place and may be considered nearly the equal of the cutter, her extra size about offsetting the difference in rig. Unfortunately neither of these boats were in all the races and in the most important of them the former was disabled and the latter thought with Gracie that "He who fights and runs away," etc., so that here no comparison is possible. Looking then at the entire series of races, not merely from the recorded times, but from all points of view, and considering the attendant circumstances, it is possible to draw some conclusions while waiting for the more thorough trials of this week. On the first day in light weather and with some chances for flukes, Priscilla was first in at the end of 90 miles, not counting her grounding, but really she had not outsailed on even terms Bedouin or Grayling, the three finishing about the same time. Puritan was not in this race, but on the following day, still in light weather, Puritan won by only a small fraction of time, but showed marked superiority in sailing, while as between old and new the two sloops were about on even terms with Grayling, as might have been expected, down wind and reaching, while they nearly doubled their time allowance on both Gracie and Bedouin, showing a marked gain over the two older boats. In the duster of Monday there was little left for comparison. "All signs fail in time of drought," similarly Grayling and Gracie fail as standards in such weather, but to the time of her disaster Bedouin was well within her allowance and sailing finely, so that the big sloops had little the best of her. Of the two latter Puritan showed up far and away better in rough water and plenty of wind, not only beating her rival easily but making her victory more remarkable from the manner in which it was accomplished. How they would have came out had Bedouin finished, it is impossible to say, but the big cutter had gone easily through the worst part of the race when she broke down, and was not far from the two leaders.

Wednesday's work is a puzzler, a short run down wind in which Priscilla beats Puritan by ten minutes, but at the same time does little more than save her allowance on Gracie, while the latter beats on even time both Puritan and Grayling, which came in together, a state of affairs from which it is hard to deduce any conclusion except that free in light weather Priscilla did fairly beat Puritan, even allowing for the latter's split sail. The race to Vineyard Haven showed a marked superiority in the sailing of Puritan, though the accident to her throat halliard lost her the race, but in spite of the time she lost she twice outsailed Priscilla fairly. The next day, the last of the cruise, showed a final victory for Puritan, winning easily in a light wind.

Between the boats the honors lie with the Boston sloop, not only for the greatest number of races on the record, but for the general superiority of her performance in all weathers over that of the Priscilla, and pending the result of the alterations just made in the latter, the Puritan must be adnitted to be our best hope in the coming races. Between the old and new boats the tests have not been as thorough, nor the results as evident. Priscilla did no better on the first day than Gracie, Bedouin or Grayling, only twice were Priscilla and Puritan entered against these three, and on one of these occasions, the run from New London to Newport, while they both beat Gracie and Bedouin over a quarter of an hour, they barely beat the schooner, while the other race, that for the Goelet Cups, saw Gracie and Grayling withdrawn, and Bedouin disabled, so that no test was possible. On the run to New Bedford it was Gracie's turn, and she gained her time on Priscilla and did still better with Puritan, while Grayling was not far behind, so it will be seen that the trials thus far, while by no means thorough, have failed to show that great superiority over our older boats which is necessary in a yacht which would meet Genesta successfully. The race of to-day, it is to be hoped, will bring out a goodly show of sloops, in order that the power of the new boats, not only as against each other, but as compared with our entire fleet, may be closely gauged before the final races.

HULL Y. C. OPEN REGATTA.

THE open regatta of the Hull Y. C. sailed on Saturday last, was a most successful affair in all ways, as the entries were numerous and the weather fine for racing. This year, for the first time, no entrance fee was charged, but entries were free to the yachts of all recognized yacht clubs, the result being that a fleet of 65 yachts, cutters, sloops and catboats, from 16 up to 40ft. crossed the starting line. This fleet was divided into 5 classes: 31 and under 40ft. corrected length, 24 and under 31ft., 21 and under 24ft., 19 and under 21ft., and yachts under 19ft. The first 3 classes were also divided in keel and centerboard. Three courses were laid out as follows: For first class —From starting line, leaving Hunt's ledge and Point Allerton buoys on starboard, Harding's bell boat on port, Graves whistling buoy on port, Ram Head buoy, Lovell's Island and Fort Warren on port, Galoupe's Island on starboard, to and across line between judges' boat and flagboat. Fifteen miles. For second and third classes—From starting line, leaving Hunt's ledge and Point Allerton buoys on starboard, Harding's bell boat on port, Martin's ledge buoy on port, Shagg Rocks on starboard, Hunt's ledge buoy on port, to and across line between judges' boat and flagboat. Twelve miles. For fourth and fifth classes—From starting line, in through Hull Gut, leaving bell buoy on starboard, flag boat one-half mile southeast on starboard, H. Y. C. barrel off Prince's Head on port, H. Y. C. barrel off northwest end of Bunkin Island on port, flag boat before mentioned on port, H. Y. C. barrel off Prince's Head on port, H. Y. C. barrel off northwest end of Bunkin Island on port, through Hull Gut, leaving bell buoy on port, across line between judges' boat and flag boat. Seven miles.

A long delay occurred at starting, as the guests' steamer Rose Standish was late in coming from Boston, but at 2 P. M. all were ready at Hull Gut, with a fresh southeast breeze waiting for them. Violet took a long lead at first with Atalanta second, then Banneret, Eva, Maud, Magic, Hera, Siren, Maud is the keel sloop built by Wood Bros. last winter, of similar type with the Gem and Neva. The race between her and Hera was very close all day, and she pushed the old boat hard, though unable to beat her. The Fantine, in the same class, will be recognized better by her old name of Ella May. The full times are as follows:

	Length	Actual.	Corrected
FIRST CLASS—CENTERBOARDS.			
Magic, E. C. Neal	31.02	3 26 09	2 46 46
Violet, McKee & Hersey	34.00	3 24 51	2 48 43
Siren, L. M. Clark	38.11	withdrew.	
FIRST CLASS—KEELS.			
Hera, George R. Howe	36.03	3 21 43	2 47 58
Maud, Wood Brothers	33.06	3 26 37	2 05 05
Fantine, Mason & Thompson	32.04	did not finish.	
Lydia Adams, Hartford Davenport	31.00	did not finish.	
SECOND CLASS CENTERBOARDS.

Susie, D. F. Follen	19.06	2 48 00	2 20 45
Jewel, W. E. Sheriffs	19 05	2 52 56	2 23 26
FIFTH CLASS.			
Wildfire, H. A. Keith	17.09	2 25 20	1 56 05
Hornet, Harding & Merrill	18.11	2 26 00	1 58 13
Flora Lee, D. H. Lincoln	16.09	2 29 29	1 58 49
Kismet, A. P. Thayer	18.06	2 35 32	2 07 00
Imogen, B. T. Wendall	18.04	2 37 50	2 09 07
Jessie, W. B. Smith	18 07	2 37 40	2 09 14
Flirt, J. W. Hildreth	15.03	2 43 06	2 09 21
Hestia, W. H. Dennen	18 04	2 42 13	2 13 30
Mischief, D. W. Belcher	16.07	2 45 23	2 14 30
Nonpareil, E. Lanning	17.01	2 45 36	2 15 22
Spray, H. M. Faxon	18.04	2 45 35	2 16 52
Crescent, T. M. Alley	17.01	2 48 34	2 18 20
Peri, H. Parkman	18.09	Withdrew.	

The Nettle protested the Tartar for fouling the barrel off Bunkin's Island, and the Black Cloud protested the Queen Mab for not leaving Hunt's Ledge buoy on the port. If these protests are granted it will affect somewhat the prize winners. If not, prizes will be awarded as follews:

First class centerboards—First, $50, Magic. First class keels—First, $50, Hera; second, $25, Maud. Second class centerboards—First, $40, Eva; second, $20, Atalanta. Second class keels—First, $40, Banneret; second, $20, Cricket. Third class centerboards—First, $35, Black Cloud; second, $20, Queen Mab; third, $15, Expert; fourth, $10, Sea Bird. Third class keels—First, $35, Kitty; second, $20, Thelga; third, $15, Witch; fourth, $10, Straurare. Fourth class—First, $30, Em Ell Eye; second, $20, Nettle; third, $15, Tartar; fourth, $10, Niobe. Fifth class—First, $30, Wildfire; second, $20, Hornet; third, $15, Flora Lee; fourth, $10, Kismet; fifth, $5, Imogen.

BAY OF QUINTE Y. C.'S REGATTA.

THE Bay of Quinte Y. C.'s regatta, being the last of the series under the auspices of the Lake Yacht Racing Association, was sailed on the 12th and 13th inst. On the first day it was a failure owing to lack of wind, and on the second day it was brought to an issue in a light breeze. Entries were narrowed down to two in the first class and to three in the second class, and this despite the repeated promises of members of the other clubs that they would take part in our race. Perhaps the fact that the Atalanta and Norah have been proved to be faster than the other first class yachts on fresh water had something to do with the failure of any representative of any other club to appear, and perhaps not. Our local fleet was ably represented by one yacht in each class, and the net result was that the Atalanta won three firsts and one third, and the Iolanthe in the second class, captured three firsts and one second out of four races. Both craft would have had an unbroken series of victories but for ill-luck at Toronto for the Atalanta, and at Oswego for the Iolanthe.

The entries in our races were as follows:

First class—Atalanta, D. R. Leavens, Belleville, 66.08ft. corrected length; Norah, R. J. Bell, Belleville, 50ft. Atalanta allows Norah 7m. 39s.

Second class—Iolanthe, W. H. Biggar, Belleville, 36.02ft. corrected length; Laura, T. W. Robinson, Kingston, 35.02ft.; Surprise, A. Forbes and J. Richardson, Trenton, 32.06ft. Iolanthe allows 1m. 27s. to Laura, and 4m. 23s. to Surprise.

On Wednesday Atalanta and Iolanthe had long leads in their respective classes when the wind died out. Thursday morning was very unfavorable, but shortly before noon a light breeze sprung up from the S.W., and at 11:55:15 A. M. the first signal was fired. A late start was made, Norah going over on the limit, while Atalanta was handicapped 1min. The second class started; Surprise 12:9:37, Iolanthe 12:12:46, Laura 12:13:57. The course was to a buoy off the north shore, thence to a second buoy and home, 10 miles; to be sailed three times by the first class and twice by the second. There was little beating on any part of the course, Norah led by a minute at first mark, holding Atalanta over most of the first round, but at the end the latter led her by 41sec. The wind grew lighter in the second round, Atalanta still leading, this time by nearly 8min, Surprise led at first in second class, Iolanthe pushing her, and on the second leg running through her lee and leading her by half a minute at the second mark and 2min. 45sec. at the end of the round. From here out she gained, winning by a quarter of an hour. The wind was light and uneven toward the last of the race, Atalanta still heading. After Atalanta was in the wind fell and Norah gave up. The times in second class were:

	Start.	Finish.	Actual.	Corrected.
Iolanthe	12 12 46	2 55 20	2 42 34	2 42 34
Laura	12 12 57	3 19 42	3 06 45	3 05 18
Surprise	12 09 37	3 21 22	3 11 45	3 07 22

The second class yacht Fannie F. of Oswego arrived on Wednesday night, the Ethel of Oswego turned up as the Atalanta was finishing the race on Thursday, and the steam yacht Ruth, also of Oswego, arrived this morning. All cleared for home to-day.

BELLEVILLE, Ont., Aug. 14. PORT TACK.

WOOD'S HOLL CATBOAT RACES.—On Aug. 14 an open regatta for catboats only, was sailed at Wood's Holl, the course being around a buoy off Falmouth, and a stakeboat off Nobska. The wind was strong from S. W. and most of the boats were reefed. The entries and times were:

	Actual.	Corrected.
BOATS OF 21FT. SAILING LENGTH.

BOATS FROM 15 TO 21FT.		
Scud, Falmouth	2 00 12	1 53 11
Mertie, Wood's Holl	2 01 47	2 00 14
Lady of the Lake	2 01 55	2 01 01
Mystic, Falmouth	2 06 04	2 02 02
Bessie, Quissett	2 11 30	2 03 30
Maltese, Wood's Holl	2 07 38	2 05 27
Psyche, Wood's Holl	2 13 05	2 06 06
Mermaid, Wood's Holl	2 24 52	2 17 10

Catboats under 15ft.—F. L. Gifford first, John Swift second, Dr. Kidder third. Centerboard spritsails.—A. S. Messer first, Henry Cook second, Joseph S. Fay third. Keel spritsails.—T. Aiken first, Fred Gifford second, Benjamin Gifford third.

CORINTHIAN Y. C. CHAMPIONSHIP RACE.—This club sailed its second championship race on Aug. 12, at Marblehead, with nine entries. The order at the start was Expert, Witch, Fad, Ralph and Æolus in first class and Psyche, Wraith, Dash and Unique in second, the latter handicapped 2min. In both classes the centerboards were beaten by the keels as shown in the table:

	Length.	Actual.	Corrected.
FIRST CLASS—CENTERBOARDS.			
Expert, L. Whitcomb	28.03	2 18 55	1 44 50
Ralph, G. S. Osborne	28.10	2 33 44	2 05 29
FIRST CLASS—KEELS.			
Witch, B. B. Crowninshield	22.10	2 12 15	1 37 40
Æolus, I. C. Mills, Jr	28.03	2 24 38	1 55 50
Fad, G. A. Goddard	21.11	2 33 00	1 02 15
SECOND CLASS—CENTERBOARDS.			
Dash, A. S. Browne	20.01	2 28 33	1 07 26
Psyche, H. M. Sears	17.05	1 29 42	1 06 22
SECOND CLASS—KEELS.			
Wraith, C. J. Paine	18.08	1 28 07	1 05 56
Unique, G. A. Stewart	19.10	1 31 00	1 12 45

The winners were Witch, Expert, Psyche and Wraith. The next race will be sailed on Aug. 22, and the fall matches on Sept. 12. The judges were Messrs. J. B. Rhodes and Russell Whitcomb. Wraith is the new keel catboat, recently built by Smith from Mr. Burgess' designs.

MINNETONKA Y. C. REGATTA.—On Wednesday of last week a regatta was sailed on Lake Minnetonka, by the yachts of the Minnetonka Y. C., in a strong breeze from the west, causing most of the yachts to reef. The course was 10 miles. The results were as follows:

	Length.	Actual.	Corrected.
SLOOPS.			
Mary Lee, C. M. Hardenburg	21.08	0 51 30	0 51 30
Pearl, Highland Club	20.00	0 54 16	0 52 24
CLASS A—CATS.			
Lazy Jane, G. V. Johnson	21.00	0 51 04	0 50 43
Princess, E. J. Phelps	21.00	0 51 48	0 50 46
Catharine, Highland Club	28.00	0 12 27	0 50 50
Idylwild, Dale & Morse	21.00	0 53 35	0 51 33
Marchioness, C. A. Bovey	20.00	0 53 56	0 51 04
Elvira, Bidwell & Co	20.00	0 54 03	0 51 52
Ida, G. Brackett	22.00	0 53 11	0 53 11
Eleanor, H. E. Selden	20.00	1 02 35	1 00 24
CLASS B—CATS.			
Helen, J. E. Starr	19.02	0 56 55	0 56 55
Swallow			
Glide, C. E. French	18.00	1 00 45	1 00 02
CLASS C—CATS.			
Ariadne, S. C Gale	16 00	1 05 54	1 04 24

The judges were Capt. Howard L. Christian and Chas. M. Palmer

BEVERLY Y. C.—One hundred and second regatta, Monument Beach, Aug. 15, 1885.—The third race for Buzzards Bay Cups was sailed on the 15th, wind N. E., a strong wholesail breeze; Surprise, in fact, putting in a racing reef. Course for second and third classes, around Bird Island and Scragg Neck buoys and return, eleven miles. For fourth class round Dry Ledge and Abial's Ledge buoys and return, seven and one-half miles. No sloops started; Lestris arrived too late to start:

	Length.	Start.	Corrected.
SECOND CLASS.			
Surprise, J. M. Codman	27.03	2 06 19	1 55 46
Mattie, Vice-Com. Stockton	28.10	2 08 57	1 59 12
Myth, Thos. Parsons	27.04	2 23 08	2 12 35
THIRD CLASS.			
Falka, C. S. Robinson	25.03	2 36 33	2 23 45
FOURTH CLASS.			
Fannie, F. W. Sargent	23.09½	1 42 21	1 32 22
Petrel, Geo. H. Richards	20.06½	1 46 09	1 33 01
Dolly, A. S. Hardy	22.08	1 50 54	1 40 00

Surprise, Falka and Fannie take first prizes, Petrel and Mattie second prizes. Fannie takes and holds pennant. Judges—R. Codman, W. W. Appleton, A. H. Hardy. Judges' yacht, Violet, B. Y. C.

AN IDEA FOR THE REGATTA COMMITTEE.—*Editor Forest and Stream:* The Regatta Committee of the New York Y. C. are doubtless swamped with suggestions about the races for the America Cup, but still I venture to make one which seems to me of value—viz., that as soon as the trial races shall have shown whether Priscilla or Puritan is to be our representative, the other shall be used as a sort of trial horse; that is, suppose Priscilla is selected, then Puritan shall be kept in exactly the same trim, and Priscilla, by shifting ballast, increasing or reducing sail, sailing very close hauled or with a good full, etc., and sailing with Puritan always in same trim every day, finally get her very best trim and enable her sailing master to learn all about her best points and her crew, so that he can utilize both to the best advantage. This is necessary if we are to keep the Cup on this side. Genesta is a crack and has a crack racing crew, at least three minutes in a forty-mile race better than any crew we can get together in the few weeks remaining. They are all nearly the same size, a great point in a racing crew, as hauling power is more effective when all have the same length of arm and leg, and these races will be so close that such points are of vital importance. Priscilla and Puritan should get to work at once, and each should carry only one captain. They don't seem to appreciate the job they have undertaken.—YACHTSMAN.

NEW HAVEN Y. C.—On Aug. 6, a race was sailed for the *Register* challenge cup, over a course of 20 miles, a run of 10 miles out under spinnakers, after which the wind shifted and the fleet came home with spinnakers set. Only Class D yachts started, Vixen, Louise and Stranger. The race was very close, Stranger finally winning on corrected time:

	Start.	Finish.	Corrected.
Vixen	10 50 53	4 21 54	5 20 48
Stranger	11 00 30	4 24 50	5 11 27
Louise	11 01 12	4 29 07	5 23 57

The yachts of the club started on their annual cruise to New Bedford, on Aug. 9.

THE WINNER OF THE SWEEPSTAKE RACE.—The sweepstakes between Athlon, Isis, Stranger and Gaviota in the Goelet cup race has been awarded to Athlon, the owner of Stranger paying his part at once.

NEWARK Y. C.—An open regatta will be sailed over the club course at Greenville on Sept. 14. About thirty boats will probably be present.

NEW YACHT CLUBS.—A yacht club has been organized at New Rochelle, the name being the New Rochelle Y. C. The officers are: Commodore, C. Pryer; Vice-Commodore, J. H. Ryley; Secretary, P. J. Krackel; Treasurer, Eugene Lamort; Trustees, N. D. Lawton, F. J. Alder. Another club has also been formed at Cold Spring Harbor, New York, under the name of the Glenada Y. C. The officers are: Commodore, J. C. Bingham; Vice-Commodore, Everett Dole; Rear-Commodore, Shepherd F. Knapp, Jr., and Secretary, James E. Wood.

THE LAUNCH OF THE CORONET.—The large cruising schooner that Messrs. Poillon have been building for Mr. R. T. Bush, was launched successfully on Monday afternoon, taking the water very prettily at 2:15 P. M. A large number of guests were on board, one of whom, Miss Gracie W. Beard, broke the bottle and bestowed the name of Coronet on the new boat as she touched the water. The Coronet is intended solely for cruising, and her owner will make a long voyage in her, starting this winter or next spring. Her length is 139ft. on deck, 116ft. waterline, 26ft. 4in. beam and her draft is 12ft. 6in.

YACHTING NOTES.—Huron has had a new mast lately....Ileen will soon be out with her mast 18in. shorter and 2ft. further aft, also with additional lead on her keel. Her boom now is 57½ft. long....Regina, sloop, is hauled out at Lawley's for overhauling. The schooner Atlanta is also on the same ways....The damages sustained by the Mohican in the Goelet Cup race have all been repaired ... Bedouin has her new bowsprit and arrived off the S. C. Y. C. house on Tuesday afternoon....Polynia has been on the screw dock for several days. One blade was broken from her propeller and her shoe was carried away by striking some rock or old wreck in the East River... The Nooya has also been on the dock to change her screw.

GREENWICH Y. C. REGATTA.—The first annual regatta of this club will be sailed on Aug. 26, starting at 10 A. M., off Greenwich, Conn. Prizes are offered for yachts of five classes, sloops, cutters and yawls of 30 to 45ft.; ditto under 30ft.; open jib and mainsail boats of 20 and under 26ft.; catboats of 18 and under 23ft., and catboats under 18ft. Besides these there will be rowing races, a canoe race, swimming and tub races and other sports, for all of which prizes will be given. The entries close on Monday night.

"RUDER UND SEGEL ALMANACH."—The *Wassersport* has lately issued a neat little book with the above title, containing a list of the various clubs in Germany, Austria and other European countries; also of the rowing and sailing races of 1884, with a list of yachts in German and Austrian waters. The book also contains other matter of interest to yachtsmen, making a very useful little volume for all who are fond of water sports. It can be ordered from the *Wassersport*, No. 6 Neue Jakob strasse, Berlin, Prussia.

BAR HARBOR Y. C.—This new club held its first regatta on Aug. 15, at Bar Harbor, Me. The yachts were in three classes, schooners and sloops over 32 and under 66ft., schooners and sloops over 22 and under 32ft., schooners, sloops and cats under 22ft. The wind was fresh from the westward all day. At 11 A. M. the gun fired for the start for first class, and at 11:15 for second and third classes. Gwendolen won in first class, Little Nell in second and Lulu in third.

DEATH OF A NEW YORK YACHTSMAN.—Mr. Wm. H. Thomas, owner of the large schooner Rambler and a member of the New York Y. C., died at his residence at Bay Ridge on Thursday last, shortly after his return from the cruise of the N. Y. Y. C. His funeral took place on Sunday at Christ Church, Bay Ridge. A large number of yachtsmen were present besides the crew of the Rambler.

RACES AT TORONTO.—A race for the third class yachts of the Toronto Y. C. for the McGaw Cup will be sailed on Aug. 22, at 2:30 P. M. A match has been arranged between the sloops Meteor and Mischief, to be sailed on Aug. 29, over the third class course, T. Y. C. rules, but with shifting ballast, anchor start from the T. Y. C. house at 2:30 P. M.

PERSONAL.—Mr. Edward Lapthorne, the English sailmaker, arrived in New York this week, and will remain until after the races. He will sail on Genesta and look after her canvas....The Oswego Y. C. will visit New York in September and will accompany the races on the tug Indian, which they have chartered for their exclusive use.

BURLINGTON BAY CHAMPIONSHIP.—The second race was sailed on Aug. 1. The starters were Cruiser, Whistlewing, Brunette, Neptune, Cacique, Coquette and Metis. The wind was S.W. and very light. Whistlewing finished first, but Cruiser won on corrected time. Whistlewing is second and Brunette third.

REGATTA AT OLD POINT, VA.—A series of rowing and sailing races will be held on the Elizabeth River, at Old Point, on Aug. 19 and 20. Besides the shell races there will be sailing races between the large canoes used on Chesapeake Bay, and also races for sloops and catboats, and possibly pilot boats.

THE LAST OF THE NEPTUNE.—The dory Neptune, which sailed some time since from Penzance for America, with a crew of one, a Norwegian named Johnson, has lately been picked up off Cape Clear by the bark Wyoming. A gun, compass and some money were found on board, but her owner was missing.

EASTERN Y. C. CRUISE.—The fleet will rendezvous at New Bedford on Aug. 29 for a cruise to New York.

BANNERET AND LIZZIE F. DALY.—The matches between these boats have been declared off.

Canoeing.

Address all communications to the Forest and Stream Publishing Co.

CANOEISTS *are invited to send us notes and full reports of cruises, club meets, information about canoeable waters, and other communications of interest.*

Secretaries of canoe clubs are requested to send to FOREST AND STREAM their addresses, with name, membership, signals, etc, of their clubs, and also notices in advance of meetings and races, and reports of the same. Canoeists and all interested in canoeing are requested to forward to FOREST AND STREAM their addresses, with logs of cruises, maps, and information concerning their local waters, drawings or descriptions of boats and fittings, and all items relating to the sport.

FIXTURES.

Sept. 19—N. Y. C. C. Regatta, off New Brighton.

AMERICAN CANOE ASSOCIATION.

SECRETARY—Dr. C. A. Neidé, Schuylerville, N. Y. Candidates for membership must forward their names, with $2 for initiation fee and first year's dues, to the secretary, who will present names to the executive committee. Money should be sent by *registered letter* or money order.

ANNUAL DUES OF THE A. C. A.

To the Members of the A. C. A.:

I respectfully call your attention to the fact that Article I. of the by-laws of the American Canoe Association was so changed at the recent meeting at Grindstone Island, that the second paragraph now reads: "Each subsequent annual payment shall be two dollars, etc. I hope the members will forward their dues promptly, as such action will materially facilitate the duties of the secretary-treasurer. A copy of the Association Book for 1885 has been sent to each member of the Association. Please notify me of any error that may occur to you. Fraternally yours, CHAS. A. NEIDÉ, Sec'y A. C. A.

SCHUYLERVILLE, N. Y., Aug. 17, 1885.

THE RECORD AT THE A. C. A. MEET.

THE Record was introduced for the first time at the meet last year. Previously it had been found that in events where skilled sailors or paddlers entered with the best chances of winning very few entries could be secured, and the races lacked interest for want of contestants. The paddlers were content to take one or more first prizes and leave the sailing races alone, and the sailors left the paddling races alone. Thus a paddling class and a sailing class of canoes began to grow up at the expense of the best all-round canoe. If allowed to go on in this way the result would have been finally, paddling machines and sailing machines. The Record gave the opportunity for a middle man to go in all races, and though not taking a single first prize, to get the best average for the meet, and therefore the best prize. This Mr. J. L. Weller did last year. He did not win first prize in a single paddling event. The Record worked well, though not generally understood, and very much increased the interest in the races, and induced more men to enter. The man who last year came in second on the Record did not enter a single sailing race, but by using two canoes managed to get three first prizes, or thirty points. This two canoe business seemed to the Regatta Committee unfair, and this year the rule was made that it should be one man and one canoe for all Record races. It worked admirably, as the result shows. The first Record prize this year was won by Mr. Gibson, the only man who went into every event he was entitled to enter—seven in all. He won one first prize sailing and one first prize for the combined race, coming in on the other five events twice second, once third, once fifth and once sixth, making in all some fifty-three points.

From the full Record, which will be published next week, it will be seen that the men standing well up toward the front, won their points all or nearly all, in paddling races alone, or sailing races alone; thus Mr. Nimick of Pittsburgh, stands at 30 points, being the result of three first prizes in Class A sailing races, while the Class B races were each won by a different man, and where 16, 13 and 18 canoes were entered and sailed. Mr. Johnson has twenty or more points, and these were won all in the paddling races. [An error occurred in the record of the upset race in our issue of last week. Mr. Johnson paddled Invincible and came in fourth, not Mr. E. W. Brown as reported.] The above facts are not brought up to detract from the credit due to Mr. Nimick for winning three straight races—for in one of them, if the record of time was correctly taken, and there seems no doubt but that it was, he made the best sailing time of all canoes in Record races A or B round the course once—24 minutes 10 seconds, the next to it Sea Bee, twice round in 50 minutes 30 seconds—but it is noted to show that the arrangement of races is not yet perfect for a fair record and the encouragement of all-round work.

The combined race, sailing and paddling, was to have been one of the leading events; but the length of the programme made it necessary to start this race when many of the men were much exhausted after the heavy weather sailing race, and therefore but three entries were secured, and the race resolved itself into a contest between a Class B boat and a Class A boat, the heavy wind and rough water favoring the B canoe, so that it won easily. There is little doubt that the B boats, as a rule, sail better and faster than the A canoes; but it is not at all certain that if they meet on equal terms, that is, an A canoe entering all of its seven events and the B entering its seven events, the A canoe will not come out ahead. In fact, had Nimick gone into the four events he might have, but did not, he certainly had a better chance of getting more points than Mr. Gibson, with but one sailing prize to his credit against Nimick's three. It seems too bad, also, that the A canoes are growing less each year and the heavier B boats are increasing. What is the reason? Is there a remedy?

SUGGESTIONS TO THE INCOMING REGATTA COMMITTEE.

Are there not too many events now on the Record? Suppose the Record was based upon three events only, one paddling, one combined and one sailing. Make these races the principal ones of the meet, give plenty of time for them and start them each and every one under favorable conditions and well apart, so there will be time to rest between them. A & B will enter different class paddling events—and sailing events of course—but come together on the combined race. Have as many other events on the programme as seems desirable—this year's list is a model, thoughtfully worked out and carried through—but make the three events above noted *the* events of the regatta, and give the five Record prizes for them only. If it seems desirable, the three events might be made five by adding one paddling and one sailing, but this should be very carefully looked into first. With three events the races would certainly be well contested, and a full list of entries secured—and no sailing canoe only would have a chance for first place—not a paddling canoe only, either. If five races are decided on, the paddling race should be the upset—100 yards, rather than the cruising trim race, as it gives more variety—and the sailing race should be limited sail, 75ft., rather than no ballast, for the majority of canoes carry no ballast anyway. At the '84 meet the combined race did not come off on account of a calm. This year the race was not a test, as it was designed to be, for reasons explained before. Cannot this be fully remedied next year?

One more point. Are not the A. C. A. prize flags getting a little common, what with first and second prizes in all races having more than two starters and five Record prizes? Would it not be better to limit the giving of second prizes to those races where at least five canoes finish?

By basing the Record on three races only, it would go far toward making the A and B canoes compete on more even terms than they now do. A good A canoe now stands twice the chance that a B canoe does, from the fact that it has fewer canoes entered against it, and that in three races makes up a hard handicap to beat. But give them one sailing race only, and the fewer entries does not affect the result much, since the second and third B canoes get much higher rates than the same A canoes. What has this year's committee to say to these suggestions? Let us hear from them.

NOTES ABOUT THE MEET.

THE sailing races this year at the meet certainly were the most successful the Association has ever had charge of. The rules have been tested and the men were familiar with them. A number of the best canoes from the clubs doing most sailing were present, and in no case was it a foregone conclusion who would win. Albany, with Snake and Thetis, Rochester with Sofronia, Pittsburgh with Nivana and Katrina, Brockville with Grebe, Deseronto with Star, New York with Sea Bee, Brooklyn with Guenn and Knickerbocker with that "real canoeist," novice though he is, and the Flit—all made it clear before any racing began that the contest was to be close.

In a scrub race for a Rushton paddle on Saturday before regatta week, Katrina showed her windward qualities in a light breeze and smooth water by winning against ten starters, Thetis, the Albany wonder, coming in second and Sea Bee third. Monday morning proved stormy and no races were sailed. Tuesday opened bright and windy, and the bay looked pretty rough for novices when their race was called. Mr. Stanton, in the Flit, seemed entirely free from any anxiety, and when the pistol for the start was heard he was off like a rocket. His two competitors upset before completing the round, but he paid no attention to them. On the second leg of the triangle he jibed the sail over as unconcernedly as though it was a flat calm. When windward work began he fastened his sheets well out of reach and then kept Flit to her work, never luffing, but just climbing out to windward himself when the squalls hit him, and brought the canoe across the home line, her centerboard at times plainly seen by those on shore, in just nineteen minutes from the time he started. This was five minutes quicker than any other time during the whole meet. It is just, however, to say that the wind favored him on the windward leg, since he had but two tacks to make where other canoes had from four to six laid out for them. When on shore Mr. Stanton was picked up by several of his club men and carried around camp on their shoulders. He remarked in a modest sort of a way, "It is easy enough to win you know, but what I like is coming in with the other canoes out of sight as it were—hull down, you know," as of course they were, having both upset.

The regular class B, no limits, was sailed in almost a gale of wind the same afternoon, and the small rig and splendid seagoing qualities of the New York canoe Sea Bee brought her in an easy winner. Seventeen canoes started, eight finished, three upset, one was disabled, and the rest gave up and paddled home. All the canoes jibed at the first turn on the first round, and this proved fatal to several. At the same turn on the second round Sea Bee, being well ahead of the Snake—the second boat—tacked so as to run no risks, the wind and sea being very heavy. This maneuver caused some remark among the canoeists, as many supposed not to jibe always showed lack of spunk, but nearly all admitted that under the circumstances in this case a tack was the best way to get round—safely. Wednesday the no-ballast race was sailed, light wind, smooth water, thirteen B canoes started. Thetis had it all her own way after the first windward tack ended, Sofronia and Sea Bee sailed together all around, four times passing each other, Sofronia finally taking second place, Sea Bee third.

The limited sail race came off in the afternoon. Smooth water, light wind, eighteen starters. The only bad start of the meet was recorded in this race. Katrina, Thetis, Sofronia, Isabel and some others getting foul of each other just on the line, and were thus much hampered in getting off. Snake and Sea Bee got the best of the start. Snake won, Thetis and Katrina making up splendidly on the fleet when once off, got second and third places, Grebe coming in fourth.

The consolation race on Friday for canoes never having taken an A. C. A. prize was won by Guenn, five starters. Guenn and Grebe had a close race of it all through, wind very light, and often passed each other. Grebe got home but ten seconds behind the winner. A reaching race was attempted in a calm. Nivana got over the course, Sofronia second. A scrub race of five canoes on Saturday was won by Thetis, Guenn second, Grebe third, a paddle for prize. Light wind and smooth water.

Of the six B sailing races Thetis took two, Snake one, Sea Bee one, Guenn one, Katrina one. Honors were, therefore, pretty easy all round. Knickerbocker got the novice race and Pittsburgh, with Nirvana, took all three of the Class A sailing races. For light winds and smooth water, Thetis, (Lansinburgh canoe) with the Mohican sail and Phil Wackerhagen to sail her, is not to be beaten every day by the best canoes and men the A. C. A. can boast of, and it does seem that the honored Tredwen himself, in his famous English Pearl, would have a hard row to hoe to get ahead of little Wack. As heretofore the heavy canoes, with big iron boards and lead mines of ballast, have done nothing to prove that they are worth the labor and worry expended on their construction rig, and especially the inconvenience of their safe transportation.

THE CONSOLATION PRIZE.

Editor Forest and Stream:

I notice in your last number the inquiry of Mr. John Henry Hull, President Brooklyn C. C., as to the fate of the "Consolation" prize he so liberally offered to the A. C. A regatta list. Although the same issue gives an account of the race and winners, I shall be obliged if you will kindly announce that the A. C. A. regatta committee had no wish to appear to neglect President Hull's welcome prize, but the unfavorable weather having crowded back many of the regular races, the extra prizes were rather late in being arranged and competed for. Probably the same day that Mr. Hull wrote his inquiry, Mr. R. J. Wilkin, of his club and of the regatta committee, reported from the regatta. The impossibility of deciding until the last day or two was the only reason that the offer did not receive immediate acceptance. It was doubtful whether the extra races could be sailed, but there was no doubt of the acceptability of the consolation prize. It was probably a printer's error which made President Hull's letter to you say the prize was offered for a paddling race, as the offer of the secretary (through whom I heard of it) stipulated a sailing contest.

The A. C. A. is indebted to Mr. Hull for a valued prize and a good idea. The race for those who have not won prizes before was a very welcome one, and will undoubtedly be repeated, as it gives to many good sailors the much desired opportunity to race without competing against the "cracks." ROBERT W. GIBSON,

Chairman, Regatta Committee, 1885.

ALBANY, N. Y., Aug. 15, 1885.

THE PACIFIC COAST MOSQUITO FLEET.

THE canoes and boats about San Francisco that constitute the "Mosquito Fleet," have been sailing a number of races this summer and the interest in the sport has been very active. The first race for the champion pennant was sailed on May 31, the course being two miles, running out and beating home. The entries were:

Talisman, Racine, 18ft.×28in., F. Pixley, Oakland C. C.; Undine, carvel, 15ft.×30in., R. Cooper, Oakland C. C.; Sunbeam, canvas, 13ft.×24in., W. Pixley, Oakland C. C.; Betsy, carvel, 13ft.×28in., R. Engelbrecht, Oakland C. C.; Hattie Bell, lapstreak, 13ft.×29in., W. H. Byrnes, S. F. C. C.; Zephyr, lapstreak, 14ft.×29in., W. W. Blow, Mosquito Fleet.

The wind was very strong for the small craft, but at 2 P. M. they were started, Hattie Bell leading, but Zephyr being first at the turn, and also at the finish. The times were: Zephyr, 30m.; Hattie Bell, 34½m.; Undine, 36m.; Talisman, 50m.; Sunbeam, 50½m.; Betsy not timed. On June 14, a second race was sailed on the creek. The entries were: Mystic, W. W. Blow; Mosquito, W. A. Byrnes; Bonito, Capt. Moody; Ripple, T. Evans; Nettie, C. G. Yale; Ella, J. P. Montague. The race out was very close, but Mosquito took a good lead coming home. The times were: Mosquito, 31½m.; Mystic, 33m.; Mr. Yale, 36½m. A third race was sailed on June 29, between Zephyr and Hattie Bell. The wind was unsteady and came in heavy puffs, one of which upset the Hattie Bell, leaving Zephyr to finish alone. On July 12, another race was sailed, resulting as follows:

Boat.	Sailed by	Turned.	Position.	Time.
Mystic	W. W. Blow	1st	1st	49
Mosquito	John Purvis	6th	2d	50
Bonita	Capt. Moody	3d	3d	54½
Ripple	T. Evans	2d	4th	55½
Zephyr	Al. Blow	4th	5th	56
Ella	M. D. Hyde	5th	6th	60

On July 19, the fleet made a day's cruise to Goat Island, 7 boats taking part: Mystic, Hattie Bell, Bonita, Ripple, Chiquita, Nettie and Nautilus. The day was pleasantly spent on the island, the fleet coming home close-reefed at night. The full list of boats composing the Mosquito fleet is as follows: Mosquito, owned by W. A. Byrnes; Flirt, Harrison; Mystic, W. W. Blow; Nettie, Charles G. Yale; Ella, Capt. J. P. Montague; Bonita, Capt. Moody; Ripple, Taliesin Evans; Talisman, Frank M. Pixley, Jr.; Sunbeam, Edgar S. Fisher; Undine, E. R. Cooper; Hattie Bell, Byrnes; Two Sisters, Dr. J. M. Willey; Zephyr, W. W. Blow; Chiquita, Evans; Burrito, H. A. Powell; Emerald, W. L. Oliver; Outing, Mead; Dolphin, Alfred Blow.

New boats are being added and old ones improved as the interest in the races increases. Mystic has lately put in a Radix board, and Hattie Bell has had a new and larger rig fitted to her.

CANOE ROUTES WANTED.—(1) I saw in some paper recently the name of a gentleman who resides in Savannah, Ga., and connected with a railroad there, who could give information about crossing Okefinokee Swamp into Suwanee River. If you do not know this person, perhaps you can give the information I need from some other source. I wish to take the trip next winter in my canoe. Cruised last winter from St. Augustine to Lake Worth, back to Rock Ledge in my canoe. I shall be greatly obliged for any information you can direct me to the possession of in regard to Suwanee route to west coast. —SETH DICKEY. (2) I want to get on the Megalloway River at the highest point where it is navigable by a birch canoe. Can you inform me what town in Canada would be the nearest place to start from? Could we buy a birch there? We were up the river as far as Rump Pond last fall, and want to start from the highest point this year and descend the whole stream if we can. Our plan was to go to the nearest place to the sources with our stores and outfit, buy a canoe there, and sell it if we could when we reached the settlements.—CHAS. G. GIBSON.

LAKE ST. LOUIS C. C. REGATTA.—A regatta will be held at Lachine, Can., by the Lake St. Louis C. C., of Montreal, the programme being as follows: Sailing race, 1 mile; portage, ¼ mile; tandem race, boys under 13 years, ½ mile; tandem race for challenge cups, 1 mile; girls' tandem race; paddling race, single, ½ mile; upset race, two upsets, 300 yards; paddling, single, boys under 18 years, ½ mile; tandem race, club members, 1 mile; hurry-skurry race, 25 yards' swim and 200 yards' paddle; paddling for ladies and gentlemen, ¼ mile. The last event will be climbing the greased pole, open to members of all boating clubs. The challenge cups offered for the tandem race are valued at $125, and must be won three times by the same crew before becoming the property of the crew. The races for them must be paddled over the Lachine course, under the management of the Lake St. Louis C. C., and the crew winning them must give security for their safekeeping until June 1 of the next year. The races will start at 2:30 P. M.

"CANOE AND CAMP COOKERY."—A vacation passed among the woods or along shore with your own camping outfit, is by far the most enjoyable, independent and least expensive way of spending the outing. But a necessary qualification is that the camper should know how to properly prepare and cook his meals. Lacking this quality, the delicacies of the season, instead of being "nectar and ambrosia," become "wormwood and ashes"—especially the latter. As an aid to the tyro in cooking, the Forest and Stream Publishing Company, of New York, have just issued "Canoe and Camp Cookery," a practical cook book for the camper. The book contains many well-tried and valuable recipes so plainly described that a failure to have well-cooked food in camp is almost impossible. In addition are hints concerning outfits, camp beds and other matters of importance to the cruiser, camper and outer.—*Trenton (N. J.) Gazette, Aug. 12.*

A RIVER AND CANAL CRUISE IN NEW JERSEY.—Two canoeists of Washington, N. J., have lately made a very pleasant cruise, starting from that place and going, by way of the Morris Canal, to Easton, thence by the Delaware River to Philadelphia and back as far as Bordentown, where they entered the Delaware & Raritan Canal. Passing through this to New Brunswick they entered the Raritan River and then Staten Island Sound. In Newark Bay a storm overtook and nearly wrecked them, but they finally reached Newark safely, leaving their canoes there for a time. Next week they will start again at Newark and follow the Morris Canal to their starting point.

CANOE FOR SALE.—We advertise this week a sailing and paddling canoe, fitted specially for sailing races. She is of the Sandy Hook model with brass centerboard, and is carvel built. Her owner is about to build a new canoe after some ideas of his own, and offers her at a reasonable figure.

BOOKS RECEIVED.

NIMROD IN THE NORTH, or Hunting and Fishing Adventures in the Arctic Regions.—By Frederick Schwatka. New York: Cassell & Co. 1885. Price, $2.50.

PUBLISHER'S DEPARTMENT.

WHY HE PINES.—I don't think you care much whether I live or don't live, nor do I see any particular reason why you should. But then I may have calamities and disappointments from which you are safe, and there is where I suffer. When I came up here I directed the FOREST AND STREAM sent to this place. I have received two or three numbers at long intervals and that is all. Now if that isn't a calamity unendurable I should like to know what would be.—OZONE.

Answers to Correspondents.

☞ **No Notice Taken of Anonymous Correspondents.**

D. K.—See our game columns.

E. D.—The Nebraska prairie chicken season will open Sept. 1.

L. C. S., New York.—Go to Canterbury, in Orange county, this State.

F. D. B.—We are inclined to think that you will have no trouble with it.

SUB.—It is lawful to kill insectivorous birds when actually destroying fruit.

R. N.—Write to John Nichols, Moosehead Lake, Me. He is a reliable guide.

PELICAN.—For descriptions of birds' eggs consult Coues's "Key to North American Birds."

G. H. DEH.—Try Tim and Seven Ponds, in Maine. See game seasons in another column.

F. A. W.—The rifle will shoot accurately up to 200 yards. There is no non-export game law in Arkansas.

PLANK ON EDGE.—We cannot ascertain positively as to the spars, but believe that they were shipped across and stepped in France, as stated by a correspondent last week.

E., Newport News.—We cannot recommend the board you mention. The dagger board is often used in sneakboxes, but the usual hinged board is the best, as it can be placed under the deck and is but little in the way.

G. S., Scranton, Pa.—We have never published working drawings of a steam launch, but may do so this winter.

J. S. D., Bethlehem, Pa.—The boats are mostly of very good model. There is no work published on the subject that we know of.

H. M. W.—We believe that rex magnus is no longer manufactured. The original company failed. We cannot tell you where to go for it.

W. R. W.—The name on the gun is probably a trade mark. We know no maker of that name. If it is satisfactory and has proved safe, you probably have no reason to be dissatisfied.

FONTINALIS.—1. Your description is too meagre; perhaps the tree was the shadwood. 2. Brook trout at the age of one year will measure from 3 to 5 inches, at the end of two years 8 to 10 inches, at the end of three years 12 to 13 inches. 3. Male trout are distinguished from the female with difficulty. At the age of three years the male is of brighter color on the belly in the fall, and the angle of his nose is sharper.

C. J. T., Portland.—Will you please tell me if you know of any way you think I can catch spotted trout in a pond two miles long and one mile wide, sandy bottom and cold clear water? This pond is quite full of fine trout and they are caught through the ice in winter as large as five or six pounds, but none are taken at any other time of year. They won't bite. I have used quite a variety of flies and bugs, little shiners, worms, and grasshoppers, and have fished early and late but can't induce them to take anything I offer them. The pond is quite full of shiners and I imagine they are the principal article of food but don't know. Ans. After all your trials there would seem to be but one thing more to do, try the shiners. They should take flies in June and August, but in the hottest weather are probably in deeper water.

J. C. H., Fort Bowie, A. T.—Please inform me whether lead picked up off a rifle range and remoulded and used again is injurious to the riflings of the barrel. Some think it is and others think not. Ans. It is just as good as it was before used. Repeated melting will harden the lead, but not to any practicably injurious degree.

H. A. N., Huntington, L. I.—The route is through Staten Island Sound, Raritan River, Delaware and Raritan Canal, Delaware River, Chesapeake and Delaware Canal, Chesapeake Bay, Elizabeth River, Albemarle and Chesapeake Canal, Currituck, Albemarle and Pamlico sounds, then by the small inlets of the Carolina coast. It is fully described in Mr. Bishop's "Voyage of the Paper Canoe."

B., Clinton, Mass.—What is meant by "peacock herl?" Will you please inform me the color of the feather meant and from what part of the peacock it comes? Webster's dictionary does not define "herl." Ans. Peacock harl (not herl) is the loose green side of the long feather as it is stripped from the quill. If you will look in Webster's unabridged you will find the word harl.

GREENWICH, Conn.—In a sweepstake match for first, second and third money A and B tie on thirteen balls, C breaks twelve, D breaks eleven. A and B shoot off, A wins. B claims second; C is given third. Please decide who is entitled to second. Ans. It depends altogether upon the rules you were shooting under. The conditions should have been clearly laid down before the match was shot. See item referring to this on page 52 of last week's issue.

The "Mayer" Minnow Casting and Trolling Rod.

This rod is made from specifications furnished by Professor Alfred M. Mayer, who with this rod and an Imbrie Black Bass Reel won first prize for black bass casting at the tournament of the National Rod and Reel Association, Oct. 23, 1884.

Its proportions were reached after a long series of experiments, the object of which was to obtain a round section bamboo rod of about 9 ounces that would feel light in the hand, be well balanced, not throw off a delicately mouthed minnow in making long casts, and finally, after striking the bass, would have enough spring and flexibility to afford the angler the same pleasure as that given him when playing a bass on a fly rod.

The rod has two tips, one 6 inches shorter than the other; the shorter tip is used for trolling and in casting when wading.

This rod has been thoroughly tested in both lakes and quick water, and anglers who have used it are unqualified in praises of its staunchness and the delicacy of its action.

Our rods have taken the highest prize at every tournament in which they have been used.

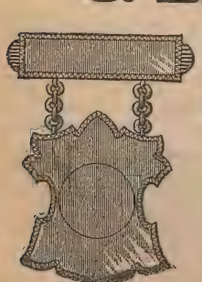
AIR GUNS PRICES: $6, $9, $10, $12, $15, $18 and $20.

FOR PROFIT AND PLEASURE.



The gun shown above is our **NEW COMBINATION AIR GUN.** This is the most complete arrangement ever offered. It combines two pieces in one (a perfect Rifle to shoot a regular .22-100 cartridge, and a superior Air Gun to shoot darts, slugs and shot). It can be instantly changed from one to the other, and has a steel barrel rifled. All the parts extra heavy, and so constructed of best material to stand continuous service, making the most durable gun manufactured, and by far the most practical long-range Air Gun ever made for gallery or field. WE MANUFACTURE A FULL ASSORTMENT OF AIR GUNS SUITED TO MEET THE TASTES AND WANTS OF EVERY ONE. The quality of our goods has established them in all the principal markets of the world, and their superiority has induced the United States Navy to place them, with success, on their school ships. ☞ Illustrated price lists sent upon application. F. A. ALLEN'S SPECIALTIES.

MONMOUTH, ILL.

ALLEN'S DUCK CALL—Improved, Nickel Plated; the most natural-toned, easiest-blowing, smallest and only Metal Duck Call ever invented and the only one that perfectly imitates the *wild* duck. Sent by mail on receipt of $1.

ALLEN'S BOW-FACING OARS—Can be attached to any boat in five minutes, shipped instantly in the roughest water; work much easier than the common oar. In duck shooting they are invaluable; you see the bird the instant it leaves the water. Sent by express on receipt of $8.

ALLEN'S SHELL SWAGE—Will reduce brass shells to their original size in one-half minute, making them as smooth and solid as when new. On ordering mention gauge wanted. Sent by express for $1; by mail $1.30.

ALLEN'S DECOY DUCK FRAME—Is a simple device for holding the dead duck in a natural position in the water. Price $4 per doz. **SEND FOR CATALOGUE FREE.**

CANOE HANDLING.

By C. B. VAUX ("DOT").

A complete manual for the management of a canoe. The author begins at the very beginning, describes and explains the rudiments in the simplest and plainest way possible. Everything is made intelligible for beginners; and besides this A B C teaching there are so many hints and wrinkles that the oldest canoeist afloat will find pleasure and profit in the study of these. The book is complete and concise—no useless duffle between its covers. The subjects treated are the choice of a canoe, paddling, sailing, care of the canoe, recipes and rules. The text is further elucidated by numerous practical drawings, and the beauty of the book is enhanced by the many ornamental vignettes. Pages 168; uniform with "Canoe Building." Price, postpaid, $1.00.

NEW YORK: FOREST AND STREAM PUBLISHING CO., 39 Park Row.

LONDON: { DAVIES & CO., 1 Finch Lane, Cornhill. / NORRIE & WILSON, 156 Minories, E. C.

"FOREST AND STREAM SERIES."

DEER HUNTING.

BY JUDGE JOHN DEAN CATON.

BY and by it will be time to hunt antelope and deer. It is always time to read about them. Judge Caton's book on the antelope, elk, deer, moose and caribou of America discusses in a readable way the life history of these animals and the methods of their capture. It is the work of an enthusiastic sportsman who has had a wide experience and has devoted the leisure of years to studying these interesting game animals. The volume is very fully illustrated, and is a perfect storehouse of information and entertainment. The first edition was sold by the Boston publishers at $4. Price $2.50.

WOODCRAFT.

BY "NESSMUK."

A COMPACT pocket handbook of condensed, boiled-down, concise, clear, comprehensive, sensible, practical camp gumption. "Nessmuk" has been "in the woods" in Michigan, New York, Pennsylvania, and South America, and this is a book for outers, wherever they kindle their camp-fire. The author believes in "smoothing it." He has learned how; now he tells others. It is much easier to learn from "Nessmuk" than from Dame Experience. We should not be surprised if "Woodcraft" completely revolutionized the methods of camping out. If you are going to the woods, read "Woodcraft" before you go. It may add to your trip a hundred fold. Price $1.00.

DOG TRAINING.

BY S. T. HAMMOND.

HE was a promising puppy, and when you turned him over to the breaker to be educated, you thought he was bound to make "the best dog in the world." And you'll not soon forget how disappointed and disgusted you were when the dog, the breaker and the big bill—all three turned up together, and you saw that the animal's spirit was broken and it would take a steam calliope to make him mind. Now, this could not have happened if you had been wise enough to buy a copy of Hammond's book, and in your odd leisure moments *train* the dog yourself instead of having him *broken* by some one else. We are selling edition after edition of this book, and it is revolutionizing the system of preparing dogs for work in the field. Price $1.00.

SHORE BIRDS.

A PAMPHLET for those who "gun" along the shore. Tells of: I. Haunts and Habits—Where the bay birds live and what they do at home. II. Range and Migration—Where they go to breed and where to spend the winter. III. A Morning Without the Birds—An episode of shore shooting. IV. Nomenclature—A list of our American species of *Limicolæ*, with a description of each specie-. V. Localities—Where to go to shoot them. VI. Blinds and Decoys—How to shoot them after you have reached the grounds. 45 pp., paper. Price 15 cents.

ANGLING TALKS.

BY GEORGE DAWSON.

AS a political writer of conceded power, Mr. Dawson wielded a trenchant pen: when he terned from the conflict of parties to the praise of the favorite pastime of "simple wise men," his essays, limpid as the crystal streams, are aglow with the soft summer sunlight and melodious with the songs of birds. When angling was the theme, he wrote from a full heart and in closest sympathy with the scenes and pursuits described. These "Talks" are brimful of manly, wholesome sentiment; there is in them all not a particle of cant. Their sincerity and overflowing spirit at once win the reader, and he perforce shares the author's enthusiasm. The effect is magical, like that of the mimic players in Xenophon's *Memorabilia:* he who reads, if he be an angler, must go a-fishing; and if he be not, straightway then must he become one.—*Extract from Publishers' Preface.* Cloth, price 50 cents.

CANOE "AURORA."

BY DR. C. A. NEIDÉ.

A CHARMINGLY written and always entertaining account of a canoe cruise from Lake George, New York, down the Ohio and Mississippi Rivers to the Gulf of Mexico, by the Secretary of the American Canoe Association. To read the cruise of the "Aurora" is the next best thing to having made it; and the reading is decidedly more pleasant than would have been participation in some of the misadventures related. 216 pp., cloth. Price $1.00.

Any of the above books can be obtained in London of Davies & Co., 1 Finch Lane, Cornhill.

CANOE

THE FOREST AND STREAM began a year ago the publication of a series of papers on canoe construction, by Mr. W. P. Stephens, of the New York C. C., widely known as an expert on canoe design and building. These papers, having appeared through the year in our columns, have since been rewritten, and with numerous additions are now published in a handsome volume under the title of "Canoe and Boat Building for Amateurs." Mr. Stephens is peculiarly fitted for the preparation of such a work, beginning as an amateur, and having after a long experience of the difficulties attending a learner, taken a prominent place among canoe builders, due both to the model and workmanship of his canoes. Realizing fully the difficulty of explaining to a novice an art in itself far from easy,

AND

and with which he is entirely unfamiliar, the book begins with a description of the various classes of canoes in general use, with their main features and dimensions, and definitions of the terms used in connection with them. Numerous examples of canoes are given, and in connection with them, such plain instructions in designing as will enable the beginner to select intelligently the proper craft for his pur-

BOAT

pose, and to plan her dimensions, details and fittings. To this end designs of all classes of canoes are given, with full dimensions and details. The object has been not merely to enable the tyro to build one boat as described, but to teach him the principles of designing and building in such a way that he may construct such a craft as he desires, following the chapters on designing, the construction of a canoe is taken up in detail, the tools and appliances being first clearly described, as well as the various materials, after which follows the actual work of building. Every operation is taken up in order, from the selection of the keel to the varnishing of the finished boat, and illustrated with numerous diagrams.

A chapter on sails describes all the varieties in use by canoeists, down to the new Mohican settee, with directions for making, rigging and measuring them, while the method of proportioning the sails to the boat is clearly explained, all the calculations

BUILDING

being worked out in detail. The many minor points of a canoe, paddles, steering gears, rudders, aprons, and camp outfit are also described at length, while a chapter is devoted to canvas canoes.

The subject of boat building is fully treated, a rowboat of the usual construction being taken as an example, and described in all its parts in such a manner as to make clear the principles involved, and their application to any form of boat, either lapstreak or carvel build. Each of the numerous technical terms belonging to the subject is defined clearly when it first occurs, and as the index is full and complete, the book is in itself a glossary.

In addition to the numerous diagrams in the body of the work, twenty-four large plates are printed on bond paper, containing the working drawings of canoes for paddling, sailing, cruising

FOR

and racing, with their sail plans, rowing sailing boats, large canoe yawls, and various boats for special purposes, such as gunning boats, yacht boats, and the widely known sneakbox.

The canoe yawl, a boat between a canoe and a yacht, is illustrated by examples of various craft from 17 to 20ft. long, and suitable for a crew of two or three on a cruise. This class of boat, while little known among us as yet, is admirably fitted for cruising, and will meet the wants of many who object to a canoe as being too small, and yet desire a boat with the same excellent qualities. The boats and canoes illustrated are in all cases among the best of their class, the list of canoes including English, Scotch and American craft, and are all drawn

AMATEURS.

to scale, so as to be available as working drawings. The plates, for convenience in using, are placed loose in a tough manilla envelope and accompany the book.

Pp. 168, with 24 plates of working drawings. Price $1.50. Address,

GRATEFUL—COMFORTING.

EPPS'S COCOA.

BREAKFAST.

"By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast tables with a delicately flavored beverage which may save us many heavy doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame."—*Civil Service Gazette.*

Made simply with boiling water or milk. Sold only in half-pound tins by Grocers, labelled thus:

JAMES EPPS & CO., Homœopathic Chemists, London, England.

HINDS' BLACK-FLY CREAM,

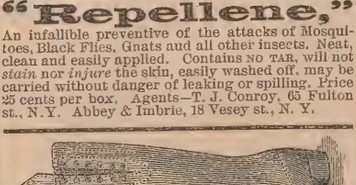
For Repelling

Flies, Mosquitoes, Midges and other Insects, and protecting the Skin from Sunburn, Irritation and Infection.

No Tar. No Stain.

GLENS FALLS, N. Y., June 15, 1884.

Mr. A. S. Hinds, Portland, Me.:



DEAR SIR—I have not sooner acknowledged the receipt of box of "Black-Fly Cream," as I desired to first test it; this I have now done on two fishing trips where I found the Mosquitoes, Black Flies, Punkies and Moose or Deer Flies in great abundance. Although all these pests swarmed about me, I found the *Cream a perfect preventive* against their bites when it was applied to face, hands, ears and neck. For many years I have sought after *the* insect repellent, and have tried all manner of compounds, but yours is the most thorough, at the same time cleanly and not disagreeable.

Yours truly, A. NELSON CHENEY.

Price, 25 Cents, Postpaid.
SOLD BY DEALERS IN SPORTING GOODS.

"Repellene,"

An infallible preventive of the attacks of Mosquitoes, Black Flies, Gnats and all other insects. Neat, clean and easily applied. At New York, 1884, seven firsts, six specials and one third.

CHAMPION BRED ST. BERNARDS, CHAMPION BRED ENGLISH PUGS, Enclose stamp. CHEQUASSET KENNELS, Lancaster, Mass.

FOR SALE, A NUMBER OF WELL BRED AND well broken pointers and setters, also dogs boarded and broken, satisfaction guaranteed. Address H. B. RICHMOND, Lakeville, Mass. Sept22,tf

Prize and Pedigree English Mastiffs.

American gentlemen desirous of purchasing these noble dogs should communicate with JAMES HUTCHINGS, 25 Gandy street, Exeter, England, who has the largest kennel of mastiffs in the world.

K 9 Breaking Kennels.

Pointers and setters thoroughly broken for field trials or private use. Reference given. W. G. SMITH, Field Trial Trainer, Templeville, Md.

BOOK YOUR DOGS FOR THIS SEASON'S training on woodcock, partridge and quail, commencing Aug. 1. Fifty dollars for the season. D. F. WILBUR, Myricks, Mass. jy9,tf

Rory O'More Kennels.

For Sale—Thoroughbred red Irish setter stock, full pedigreed. Address with stamp,

W. N. CALLENDER, Albany, N. Y.

FOR SALE.—HAVING RECENTLY ADDED several fine brood bitches to the Landseer Kennels of Scotch deerhounds and greyhounds reduced the price of puppies. Some choice greyhounds now ready to ship. DR. VAN HUMMELL, Denver, Col. apl16,tf

DOGS. DO YOU WANT TO BUY A FINE bred dog of any kind? If so write and name the kind you want. EDMUND MAURER, 464 North Ninth street, Philadelphia, Pa.

YOUR DOG'S PICTURE.

Life size crayons of dog heads or full figure accurately and artistically made from photograph by an experienced crayon artist. Prices reasonable; satisfaction guaranteed. M. LEWIS, care Forest and Stream.

FOR SALE—THE MASTIFF DOG DE BUCH (A.K.R. 1502), 3 yrs. 4 mos. old, 1st, New York, 1883, of immense bone and substance, powerful, symmetrical and compact, of excellent temper. A valuable sire to mate with weedy bitches, always transmitting his great bone and substance. W. WADE, Hulton, Pa. jy30,5t

FOR SALE.—PURE LAVERACK PUPPIES, combining the blood of Pontiac ex Fairy II. Carlowitz ex Princess Nellie, Thunder ex Peeress, etc. HENRY STURTEVANT, Medina, N. Y. jy30,5t

WANTED—A BEAGLE, FOX-TERRIER OR Dachshund bitch for rabbit shooting. Must be well broken. Low price. Address RABBIT HOUND, care Forest and Stream. aug20,1t

FOR SALE.—AT A REASONABLE PRICE, A dark liver English setter bitch, 18 mos. old, staunch and thoroughly broken on quail and woodcock. Address P. O. Box 20, Middletown, Orange Co., N. Y. aug20,3t

FOR SALE.—A FIRST-CLASS FIELD DOG BEtween 3 and 4 yrs. old, black English setter; cannot be beaten on partridge, woodcock or quail. Don't retrieve except from water. Highest references in regard to him. J. S. BANCROFT, care of Forest and Stream. aug20,3t

FOR SALE.—MASTIFFS, POINTER PUPPIES, Prince Charles and Blenheim spaniels. C. H. MASON, 255 West Twenty-second st., New York. jy30,tf

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, $4 A YEAR. 10 CTS. A COPY. SIX MONTHS, $2.

NEW YORK, AUGUST 27, 1885.

VOL. XXV.—No. 5. NOS. 39 & 40 PARK ROW, NEW YORK.

CORRESPONDENCE.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. Communications upon the subjects to which its pages are devoted are respectfully invited. Anonymous communications will not be regarded. No name will be published except with writer's consent. The Editors are not responsible for the views of correspondents.

ADVERTISEMENTS.

Only advertisements of an approved character inserted. Inside pages, nonpareil type, 25 cents per line. Special rates for three, six and twelve months. Reading notices $1.00 per line. Eight words to the line, twelve lines to one inch. Advertisements should be sent in by the Saturday previous to issue in which they are to be inserted.

Transient advertisements must invariably be accompanied by the money or they will not be inserted.

SUBSCRIPTIONS

May begin at any time. Subscription price, $4 per year; $2 for six months; to a club of three annual subscribers, three copies for $10; five copies for $16. Remit by registered letter, money-order, or draft, payable to the Forest and Stream Publishing Company. The paper may be obtained of newsdealers throughout the United States, Canadas and Great Britain. Newsdealers in the United Kingdom may order through Davies & Co., No. 1 Finch Lane, Cornhill, London. General subscription agents for Great Britain, Messrs. Sampson Low, Marston, Searles and Rivington, 188 Fleet street, London, Eng. Foreign subscription price, $5 per year; $2.50 for six months.

Address all communications,

ANSWERS TO CORRESPONDENTS.

THE RIFLE TRAJECTORY TEST.

EVERYTHING points to a most successful outcome in the trajectory test which the FOREST AND STREAM has undertaken for the benefit of the thousands of shooters throughout the country. The comments and suggestions, of which a few are given in our rifle department, show that the interest excited is wide-spread and that many are earnestly watching the result of the trial.

Some of our correspondents seem to allow their love for their favorite rifles to run away, in some measure, with their discretion. There is no necessity of losing one's temper over such a simple matter. For ourselves we have no idea what the test will show, nor have we much care in the matter. Having no preferences between rifles, not being bound in any way to this or that make, it will be a matter of entire indifference which may show the flattest line of fire. We shall have completed our work when, with all the data taken, the rifle shall be fired from its rest. Then the perforated screens of tissue paper will tell their tales of high or low lines of fire.

Many of our correspondents urge the fixing of a rigid code of conditions under which each rifle shall come before being admitted to the test. Weight of rifle, trigger pull, caliber, etc., are all suggested. Some of the points urged upon us for legislation are entirely foreign to the programme which we have laid out for the benefit of our readers. With a rifle clamped in a rest we cannot well see how this or that trigger pull can come in as a factor in making up the trajectory. Some hunters prefer a heavy pull while others find it safe to trust themselves in the field with a very light trigger. So too with weight of rifle. If a sportsman chooses to lug about on his tramps after game a great heavy rifle, that is a matter of no moment so far as trajectory is concerned, and while we shall give in our report of tests every detail about the rifle used, it would only complicate matters unnecessarily to make the weight of the rifle a preliminary condition of entry.

It will be a free-for-all, go-as-you-please race for superiority in flat shooting. The thousand and one other points about a rifle may be settled in other ways. With our baseline, our rest and our screens we can fix definitely the rise which each bullet undergoes in its flight from muzzle to target. There is great need, it seems to us, for just this one item of knowledge about hunting rifles at this time; if we can supply it with satisfactory exactness, the whole object of our trial will be accomplished. In a subsequent issue full and complete details with illustrations of the plans and appliances to be used will be given. Mechanics are now busy making up a rest, which can be used with any of the several rifle models, whether single-loading, magazine or muzzle. We wish to make the test to its fullest extent of practical value, and to that end especially desire to confine it to models now in actual use in the trade and in the hands of sportsmen.

CLEAN AND UNCLEAN.

THE character of a journal's constituency may be determined by the cleanliness or uncleanliness of its advertising columns. The paper that insists on decency in its advertising pages goes to one class of readers. The paper that prints dirty medical advertisements and lures for vile publications goes to a quite different class. There is no mistaking the two. Decency is expected of the one, indecency is expected of the other.

Once let a journal establish for itself a fair name in this respect, it is bound by its record and by its constituency to maintain its character. No deviation would be tolerated by its readers. If the FOREST AND STREAM should so far forfeit its self-respect as to print the foul advertisements that defile some of its contemporaries, there would be an instant and emphatic protest from its subscribers. Aside from all worthier considerations, the knowledge that the journal's readers demand purity in the advertising columns would be sufficient reason for holding to such a course.

Legitimate advertisers would have abundant reason to complain if among their notices of guns and fishing tackle and sportsmen's supplies were to be sandwiched the filthy advertisements in question; for such things disgust decent readers, and cause them to shun the advertising pages, the value of which is thereby of necessity debased.

We hold the opinion that the reading matter and the advertisements of a sportsman's journal should be clean and above reproach; and with some pride, which is perhaps pardonable, we invite attention to the significant fact that the FOREST AND STREAM is the only journal of shooting and fishing published in this country that does practically maintain such a principle. And as has been said before in these columns, when the editors and publishers find that a sportsman's paper of such character is not suited to the times, they will go into some other branch of journalism.

FROM POCAHONTAS TO PRISCILLA.

LESS than four years ago the New York Yacht Club sailed a series of races similar to those just terminated and with the same object in view, to select a yacht to defend the Cup. Then, as now, the club had built a yacht specially for the purpose, and it is gratifying to compare the new boat with the dismal failure that still graces the mud of South Brooklyn. It is true that Priscilla has not thus far proved as fast under some conditions as her Boston rival, but she has proved successful compared with a much higher standard of speed than that of 1881, and although not yet in her proper trim, and capable with some changes of rig of much better performance, even in her present form Priscilla is a very fast boat.

In each of these cases money was spent freely to secure the best boat possible, and in the first instance with more liberality than discretion. As the result proved, the boat was no credit in any way to those connected with her construction, and her collapse in the trial races terminated abruptly an inglorious career. Without entering into the disputed question as to the thoroughness of the trials and whether, with a new rig and partial rebuilding, she might not have turned out in time a fairly fast boat, it is enough to note that she was unable to stand the strain of the few trial races, and shook herself partly to pieces in them, and that, whatever the possible merits of her model, the finished boat, after the expenditure of a large amount of money, was but an empty shell and absolutely unfit for any purpose in her existing condition. Pocahontas was the last of the big wooden centerboard sloops of the old type in model, build and rig, and it is very unlikely that we shall ever see another.

While no less a centerboard sloop, Priscilla differs materially from her predecessor, but most of all in the quality of the work. Though built and rigged more rapidly than any other yacht nearly her size, she bears evidence throughout of the excellence of the material and workmanship as well as of careful planning, which it is most encouraging to notice, and which, whatever her ultimate success as a racer, is in itself a substantial proof of improvement in yacht building. Not only does the substitution of first-class ironwork in the hull for such wooden construction as that of Pocahontas mark a very important advance, but a still greater improvement is evident in sails, rigging and gear. In proportions the rig is still that of the sloop, lofty and long-sparred, and the boat would probably be much improved with a cutter rig; but what we are concerned with now are the details and workmanship, to which little exception can be found. Everything, down to the most trivial detail, has been carefully planned and as skilfully constructed, and thus far with most satisfactory results, as, in spite of her heavy rig, all the races have been sailed without accident or injury of any moment. There was no apparent reason why matters should not have been managed as well four years since, but they certainly were not; and the very marked difference betwen then and now shows an improvement that all yachtsmen may be proud of.

THE ADIRONDACKS AND AFRICA.—We suggested last week that the newspapers would make President Cleveland's visit to the Adirondacks an occasion for spinning unwieldy yarns about his camp life; and such has proved to be the fact. The Chicago *Tribune* took the familiar "Camp Fire Flickering" about the man whose frog bait crawled out on to a rock—and sat there blinking while the man wondered why the fish did not bite—expanded the story to a half column and put it in the form of a communication from President Cleveland's camp, making the President its hero. Yesterday our esteemed and monumentally enterprising contemporary, the New York *World*, appeared with a full page account of how its "tenderfoot" special reporter had accomplished an impertinent invasion of the President's camp; and editorially in all seriousness compared the feat to Stanley's search for Livingstone in Africa. If the *World* man had been posted on the game laws he would have omitted this passage: "While we were eating breakfast the distant baying of a deerhound was heard. The President, Mr. Ward, Mr. Bacon and three of the guides went down to the pond and stationed themselves at various points to wait for the deer that the excited baying of the hound showed to have been started. They saw never a deer, however." Perhaps there is no copy of the game laws in the back office of the New York *World*. It may be added that Governor Cleveland was in favor of a non-hounding law, and it is certain that President Cleveland did not practice what is now prohibited by that law.

LONG ISLAND DEER.—The deer hunters who have been so put out by the law against Adirondack hounding, should remember that there is still one county in the State where they may follow their favorite form of amusement. In Suffolk county, on Long Island, deer may be hounded during the first ten days of next October, and if all hands are patient enough to wait, and will then go down there in a body, they may secure some antlers. It is very important that every man who wants a deer should have his dogs on hand promptly, for after sunset of the opening day there will not be nearly so many deer to divide up. The Long Island people extend a general invitation to all sportsmen to join in their October deer hounding; and particulars of routes, etc., will be given in ample time.

THE PRICE IS TOO GREAT.—At Rye, near New York, the other day, a business man bade his wife good-bye and started for the city. The wife went back into the house, opened a closet where her children's toys were, and took up a gun with the intention of removing it to another room. The gun was discharged. The charge entered the woman's brain, instantly killing her. The telegraphic message announcing the fact was awaiting the husband on his arrival in the city. It was a fearful price to pay for learning the fatuity of leaving a loaded gun in a closet with children's toys.

FIRES IN THE NATIONAL PARK.—A press dispatch of Aug. 22 reports that Judge Payson, of Illinois, was arrested in the National Park for abandoning a camp without extinguishing the fire, and was fined, but resisted the payment, on the ground that the Wyoming justice who imposed it had no jurisdiction. The report adds that the justice finally "backed down," and the judge set out for home breathing vengeance. The report is evidently a one-sided and sensational account of the affair, and before commenting on it we shall await authentic advices from the Park.

THE AMERICAN FORESTRY CONGRESS.—The fourth annual meeting of the American Forestry Congress will be held in Horticultural Hall, Boston, beginning on Sept. 22, under the auspices of the Massachusetts Horticultural Society, in conjunction with the New England Agricultural Society, the Massachusetts Board of Agriculture, and the Society for the Promotion of Agriculture.

AULD LANG SYNE.

"How dear to my heart are the scenes of my childhood
When fond recollection presents them to view."

THE tales of "Uncle Lisha's Shop" and the "School Meeting in District 13," have awakened many memories of my boyhood among the hills and beside the limpid streams of the Green Mountain State, and "Onc Lisha" and "Antwine" are not such strangers as they would otherwise be. Very faithfully and enjoyably has the author pictured these and other quaint characters, and I take occasion now to thank him heartily for great pleasure therefrom. I think there were more than one pair of moist eyes when the cheery old man and his helpmeet bade a brave good bye to the home and friends of so many years, and began the long journey westward to the boy whose hold on their heartstrings was stronger than all else. It was a real scene to me.

Very much such a character as Uncle Lisha resided in the village of my birth. He was on the other slope of the hill when I was but a lad, and a source of much amusement to the villagers, as he was continually getting the "cart before the horse," having withal a bad lisp. Having borrowed a horse and saddle from a neighbor, he returned them in due time, tendering his acknowledgments for the same and saying, "I put the thaddle in the barn and hung the horth up in the thtable." Then seeing his error and the smile on the face of the lender, he said, "I thometimeth get the horth before the cart, but theldom." He was an exemplary old man whom the boys delighted to tease by borrowing his "pung" without his permission to ride down the hill o' nights when sledding was good; and intensely enjoying his lisping denunciations when he discovered them. A cherry tree that grew in the corner of his yard bore most excellent fruit. An apple tree also, that stood in an orchard some distance from my home, was a source of trouble.

That little village witnessed my first passion for guns and fishing "poles." The latter were not prohibited, although my mother had no great love for them; but the former she detested and feared. My father was very fond of trout fishing, then to be enjoyed in very many of the streams in that section, and sometimes filled my cup of happiness full to overflowing by taking me with him to carry the fish. What joy it was to follow him as he picked his way beside the foaming mountain stream and see him jerk the wriggling beauties from the dashing water, albeit my arms were weary carrying a goodly pail of fish. How refreshing at noonday were the cooling breeze and lunch under the forest trees high up among the hills, and how enjoyable at nightfall to ride homeward well rewarded by a fine catch that would grace the breakfast table next morning, rolled in cornmeal and fried brown in pork fat. I would I had some now.

Once on a fine afternoon in June—shall I ever forget the day?—my father drove up to the village school house, where I with other callow youth was struggling with Webster's Spelling Book and other insurmountable obstacles. He spoke to the teacher, who called me, and I went out. Oh, height of happiness and summits of bliss. He had come for me to go fishing with him, an unheard-of proceeding. What would the boys say now! Taken out of school to go a-fishing! I was the envy of all of them, I knew, and as I rode away in full sight of the school I was so full to bursting with pride and happiness that it was a wonder the buttons didn't fly. It seems a pity now sometimes that I wasn't more capable of appreciating occasions of this kind. We bowled briskly along the road, for my father was a lover of smart horses, and hitched the horse in a farmyard near a trout brook that slipped under a little bridge across the road in a hollow. What trout fisher has not cautiously peered into the "hole" under a bridge where partially undermined stones or logs forming the abutment made fine lurking places for watchful fish? But there were generally only a score or so of dace. I always looked, just the same, for I might see a "whopper" a half dozen inches long.

It was not a noisy mountain stream. Only a peaceful singing brook entering here a piece of woods as yet untouched by axe, where the shadows lay all day and the stones were cushioned with moss. By shady shallows, murmuring ripples, or dark pools where overhanging roots made secluded retreat for the motionless trout, the beautiful brook made its way to the pasture and meadow where the blackberry, the alder and willow fringed its banks, and the bending grasses intermingling winnowed the sunlight. Cattle lay quietly ruminating in the shade of a spreading elm or industriously grazed for the benefit of the pail, turning their heads toward us in mild expostulation at our intrusion; a watchful woodchuck on the hillside stood guard at the door of his domicile, and three or four garrulous geese down stream muddied the water beautifully as they stretched their necks toward us and harmlessly hissed their displeasure.

The sun had some time dropped below the distant mountains, the air was cool and the dew falling as we drove homeward with a goodly string of trout, closing for me a red-letter day indeed.

During this decade was born my passion for guns and things, and well I remember my first view of percussion caps, as two young men of the village met just below our house to have a little rifle practice. Those shining bits of copper possessed a strong fascination for me, and in my subsequent boyish experience, whenever I heard a cap crack I was there if I could get there. One of my companions was a year or two older than I, and had already developed much wickedness, inasmuch as he would get an old flint-lock musket that belonged to his cousin, and slip away to the pastures and blow chipmunks and other birds into atoms—sometimes. I can't remember now that he was a very depraved boy, but my mother did not think that he was just the companion for me, and rather deprecated intimacy, but we were no great strangers to each other. One day he signaled me according to the code from our back lot, and the result of the interview was that he was to come to the back fence in the afternoon with his gun, and we would go to a pasture lot a half mile from town and just turn things loose. I didn't tell everybody all about it, but at the appointed time I carried out my part of the programme, and my watchful mother viewed the departure from the buttery window. We took rather a circuitous course and reached the rear of the Methodist meetin' house, where we proceeded to go through the impressive motions of loading the gun, indulging meanwhile in many fond and glowing anticipations. Just in the midst of these things my mother walked round the corner of the building without needless delay, and nipping my pleasure and my car with the same nip, bore me off silently by a more direct route than I had come, to the seclusion of sweet home. Could my feelings be expressed? Nay, there is not literature sufficient.

I remember but one other occasion in my experience that equaled this, I may say surpassed it in sudden culmination. It was a regular *coup d'état.* It occurred several years subsequent after our removal to a Western city, but while I yet sported jackets. I was stretched flat on my stomach on the towpath of the canal with one hand just beneath the water engaged in the silent and patient endeavor to catch a crawfish when he should emerge from his hole. Anything of a paternal nature was completely absent from my mind, when there was a terrific clap preceding the lightning that was connected with my movements as I stood somehow without volition before my father. It was enough, but why it was necessary to add to my confusion by asking me what I was doing there I couldn't tell. You will generally observe that such questions are asked.

About this time I became possessor of a singlebarrel pistol, and distinguished myself by getting a piece of cap in the bridge of my nose as I was sighting a big frog under a large stone where he was trying to keep cool on a scorching August day. I carried the piece of copper three years, for my modesty forbade mention of the matter at home.

After four years' sojourn at the West we revisited Vermont. During the summer a camp-meeting was in progress near a village where I was visiting my cousin. He had made preparations to go with some comrades and I wanted to go of course, but he being several years my senior did not wish to be harassed by small fry, so he easily bought me off by getting me a singlebarrel shotgun and some ammunition and sending me after "grayers," as they called gray squirrels, the killing of one by me being furthest from his imaginings. Lovers of a gun will understand how I felt when I say it was my first experience with a gun alone in the woods.

It was a perfect afternoon for squirrel hunting, and as I shouldered the gun and started across the meadows for the woods I was a little too big for my clothes.

I had gone some distance into the woods and was walking in an old road up a slight ascent, my senses all alert, when on top of the knoll just ahead appeared a gray squirrel coming my way. He stopped and so suddenly did I that he wasn't sure he saw anything, but he sat there on top of the knoll, outlined against the green beyond, with his tail cocked over his back, and I thought he looked as big as a lamb. Presently reassured, he advanced, and when he had come a few yards I made a rush at him, and with a frightened chatter he disappeared like a flash up a huge hemlock. This was what I wished, and knowing that he would show himself in a few minutes I took my stand beside a convenient tree and waited. Before long his curiosity got the best of him, and from a height of forty or fifty feet he put his head around. I stood motionless, with my gun rested against the tree pointed at him. In a minute he began to bark, and little by little, his tail jerking at a great rate, he edged round until his whole body was in view, head downward and scolding furiously. Then I pulled trigger and he came whirling down to the ground. What a moment was that! Where were Hannibal, Xerxes and those fellows then!

I sat down and taking that squirrel I examined his teeth, his sharp claws, and feet blackened with early butternuts, smoothed his shining fur, admired his perfect spreading tail, until I cooled off, and then loading my gun I began anew my search, which ended for that afternoon by finding one more up a maple and bringing him at the first shot. Homeward I went in the evening, and when about midnight my cousin awoke me and asked what luck, and I told him, I was paid again for loss of camp meeting by his "By thunder! You didn't though?"

Through my uncle's farm ran a sizable trout stream in which were numerous "holes" where dwelt numerous "lunkers," many experienced old fellows of a foot and more in length, that had occupied their retreats for lo, these many seasons, resisting all the wiles of inexperienced boys and old trout fishers. No worm, cricket, grasshopper, or fly offered the slightest temptation, even rubbed against their noses as they calmly and confidently balanced their graceful forms with slowly moving fins or tantalizingly edged away if the attentions were too persistent.

I tried to spear one one day by tying my pocket knife to a pole, and succeeding in slicing the palm of my hand quite extensively instead of the fish. My cousin said he knew how to get them, and one Saturday afternoon when it rained so that he couldn't be sent into the field to work, we arrayed ourselves in dilapidated garments, and with a bushel basket for outfit went forth to conquer. The method was simple but effective. I held the basket at the mouth of the hole and he stirred up the trout and dirt, and when the frightened fish ran into the basket I tipped it up and broke their necks. We captured over forty that afternoon, very few of which—well, they were whoppers.

Several times have I revisited the land of my birth, have caught an occasional trout, shot the whirring partridge or the cunning squirrel, but there lingers not the fragrance around the memory of these sports that accompanies those of former days, and as the years pass by, although the fascination attending sport by field and stream is still strong, I think it is waning, and sometimes when the death quiver passes over the furred or feathered beauty, and the filmy eye closes on the familiar scenes, a guilty feeling rises for recognition as I think of Longfellow's lines:

"And the birds sang round him, o'er him,
'Do not shoot us, Hiawatha!'
Sang the robin, the Opechee,
Sang the bluebird, the Owaissa,
'Do not shoot us, Hiawatha!'
Up the oak tree close beside him,
Sprang the squirrel, Adjidaumo;
In and out among the branches,
Coughed and chattered from the oak tree,
Laughed, and said between his laughing,
'Do not shoot me, Hiawatha!'
And the rabbit from his pathway
Leaped aside, and at a distance
Sat erect upon his haunches,
Half in fear and half in frolic,
Saying to the little hunter,
'Do not shoot me, Hiawatha!'"

S.

ELK IN NEW YORK.—Hornellsville, N. Y.—*Editor Forest and Stream:* A farmer near here, while clearing up a fallow, found an enormous pair of elk horns in good preservation, which goes to show that they do not decay very easily, as it is forty years or more since an elk was killed here.—J. OTIS FELLOWS.

THE COTTON RAT AS A FIGHTER.

(*Sigmodon hispidus*).

IN collecting cotton rats I have often remarked upon the great number of mutilated males which come to hand. Tails, ears, eyes, and even legs are missing or exhibit evidence of wounds of more or less recent date. These specimens were always males, and I had long suspected that these little rodents had a penchant for regular "shindies," which the following incident seems to prove: One bright, sunny day last winter I winged a flicker and lost him among some low oak scrub and broom grass. As is my custom on such occasions, I sat perfectly still and listened. In a few minutes I heard a slight rustling and scratching under an oak bush just to the left, and turning my glass in that direction, I saw that the noise was not made by my flicker, but by a group of three cotton rats.

At first I thought they were at play, but this idea was speedily dissipated when I saw fur flying about. I could distinctly hear the "twitch" as the combatants closed and plucked away at each other. One was evidently a spectator and kept near the edge of a pretty well-defined ring that the principals had tramped down in their contest. They were plainly adepts in the art of self-defense. They backed, dodged, and feinted like human pugilists, their little eyes sparkled, and every moment or two one would rattle his teeth like a trapped woodchuck (only less so) a sort of defiance, it would seem, for it was instantly answered in the same way by the other. The points of attack seemed to be ears and tail. Charge and counter charge were quick as a flash and impossible to describe, but when a clinch occurred the movement was quite slow. Each seized the other's head with his paws and endeavored to hold his antagonist's jaws at a safe distance. It was at such times that the fur-plucking episode occurred. In the last round it became apparent that the spectator was a female. She sat upon her hind legs, crossed her little front paws and uttered a squeak; this seemed to rouse the combatants to frenzy. Each answered the cry of encouragement and closed instantly, struggling and rolling about for nearly half a minute. I took this opportunity to approach a little, with the laudable intention of obtaining specimens. Some slight noise I made probably caused them to pause, and I saw that one had the other firmly by the middle of the tail, while the other had doubled back upon himself and had seized his assailant just as firmly by the ear. The cessation of hostilities was very short and the end near at hand. The ear was bitten off, but he of the wounded tail crawled away dragging his crippled member but still holding the ear, perhaps as a trophy. The one-eared victor at once proceeded to pay his court to the fair spectator of his doughty deeds, but my hickory stick interrupted the course of true love and he is now a specimen. It seems, therefore, according to the "Marquis de Cotton Rat's prize-ring rules" a broken tail is decisive punishment.

Not at all apropos of the above, I will remark that the cotton rat takes readily to the water, swimming and diving with great rapidity. WALTER HOXIE.

FROGMORE, Beaufort County, S. C.

THE WHITE GOAT.

Editor Forest and Stream:

In your issue of July 9 appears a letter concerning the mountain goat (*Aplocerus columbianus*) and the mode of hunting it, by Mr. W. A. Baillie-Grohman, which is so widely at variance with my experience of the animal, that I am induced to offer the following in reply:

My acquaintance with the white goat commenced twenty-three years ago, in the Yellowhead Pass of the Rocky Mountains, since which time I have met him in various localities in the Cascade Mountains, at Burrard Inlet, Howe Sound and the head waters of the Stickeen and Mackenzie rivers. During all this time I have been endeavoring to invest this animal with some claim to game qualities, and wherever I have met one which showed that alertness usually found in wild animals, I have put it down on the credit side of the account; but in striking a balance up to the present time, I am sorry to rob this animal of much of the romance thrown around it by enthusiastic writers, who have, I fear, put to the goat's credit all the difficulties and dangers springing from the nature of his habitat, and whose record of slain goats could probably be counted on the ends of their fingers.

Speaking of hunting with dogs, Mr. Baillie-Grohman says: "By no other means, save perhaps some fantastical and entirely visionary drugging scheme, such as Munchhausen speaks of, could goats be approached within lassoing distance." As this assertion is unqualified, I would like to ask Mr. Baillie-Grohman with what amount of experience he is prepared to support it. I have repeatedly walked up to within fifty feet of goats before they attempted to leave the spot on which they were feeding, and when they did go it was with a shuffling, uncertain gait, as if they had not really made up their minds about it. I once saw a goat come within ten yards of our camp-fire, and there lie down, apparently anxious to watch the operation of cooking. One of our party fired four shots at him (his sights were up to 500 yards, which, of course, he was not aware of till afterward). At the first shot the goat got up and walked down the slope into a ravine; nor did the subsequent shots—all of which missed him—serve to quicken his pace in the least. I once got so close to a small band of goats that I shot two of them down without putting the rifle to my shoulder—the first time I ever tried that style of shooting. It is no uncommon thing for a Howe Sound Indian to kill twenty-five goats in a day with an old flint-lock musket, the range of which is about twenty-five or thirty yards, and instead of ball they sometimes use duck shot. I once saw two Indians kill a goat each with No. 4 shot. The distance was about forty feet, the Indians having the advantage of the cover afforded by some low bushes on the margin of a mountain stream, on the opposite side of which the goats were feeding. And these are not isolated cases, for I can recall very few instances in which goats have been at all difficult of approach.

I believe naturalists find something in the structure of the white goat to justify them in placing it among the antelopes; but, as in the case of "Nessmuk's" cranberry bear, so in this the naturalists assume too much, as there is about as much of the antelope in the actions, habits and appearance of the mountain goats which I have met as there is in a government pack mule, and about as much game as there is in the great-

horned owl—a fact which can be easily verified by any of your Eastern sportsmen who wish to come to British Columbia and hunt them.

Again, Mr. Baillie-Grohman says: "The easiest way to hunt the goat is with dogs." I might, with as much show of reason, say that the easiest way is by still-hunting, and that dogs are of no use whatever. I will endeavor, however, to be a little less dogmatic. Years ago the practice of hunting with dogs was tried and abandoned by the coast Indians of British Columbia, among them the Squamish Indians, who are the most successful goat hunters in the province; and it will be universally admitted that Indians do not abandon an easier for a more difficult method. The simple fact is that the method to be employed depends upon the ground. Dogs may be useful in Kootenai (I know the Indians use them there), but their use here would be simply ridiculous, as a careful still-hunter may, under ordinary circumstances, approach the goats almost near enough to knock them over with a club. Fleetness of foot does not belong to the mountain goat. Their eyesight is not at all keen, and they pay little or no attention to such sounds as the report of a rifle a few hundred yards away, or the step of a hunter walking over rocks within reasonable hearing distance. They are, on the whole, a dull, mopish animal; at least so I have found them.

Speaking of the "hump" of the goat, Mr. Baillie-Grohman says: "The top of it is at least eighteen inches over the level of a horizontal line drawn between the eyes and the root of the tail." But as he does not say whether the line is drawn before or after skinning, his meaning is somewhat vague. The greatest height of hump I ever measured was two and three-quarter inches above the top of the backbone—taken of course after the animal was skinned. The hair on the skin over that hump measured eleven inches. This hair stands straight up, which together with the generally shaggy nature of the coat, especially at certain seasons of the year, serves to give the animal a false appearance—that is, to make it look larger than it really is—so that the photograph which Mr. Baillie-Grohman has obtained of the famous giant ram will prove very little as regards actual size and weight. As to its girth being eight feet, with my experience of the animal, I would certainly require some better authority than that which comes from the "home of tall talk," before I would repeat it as a matter of natural history.

When Mr. Baillie-Grohman confines himself to his own experience of the weight of this animal he keeps within bounds, and as he does not personally vouch for the weight of the "giant ram," he may excuse me if I am inclined to put it in the same category with the one killed at Fort Keogh —500 pounds "judged weight"—no evidence at all.

About as large a goat as ever I saw was shot on the border of a lake some quarter of a mile from the shore of the north arm of Burrard Inlet. The hunter who shot it, an American (whether hailing from the "home of tall talk" or not I cannot say), "judged" his weight to be 350 pounds. As there was a good trail out to the beach, the goat was brought out and weighed, and the hunter had the satisfaction of knowing that his judgment was just 150 pounds astray, as the animal weighed only 200 pounds.

But it may be, after all, that we of British Columbia know nothing of the mountain goat, and that it has been reserved for an English sportsman, who comes all the way from London, sewed up by his metropolitan tailor in a fur sack, to teach us.

R. GRIFFIN.

HASTINGS, British Columbia.

WATER BIRDS OF NOVA SCOTIA—II.

BY J. MATTHEW JONES.

FAM. RALLIDÆ.

Gen. Rallus, Linn.

1. Virginia Rail (*R. virginianus*).—Common.

Gen. Porzana, Viell.

1. Carolina Rail (*P. carolina*).—Not common in the marshes during summer.

2. Yellow Rail (*P. noveboracensis*).—Very rare. A specimen was shot recently at Cole Harbor, Halifax county, and is now in Mr. Egan's collection.

Gen. Gallinula, Briss.

1. Florida Gallinule (*G. galeata*).—Rare. Three specimens only have passed through Mr. Egan's hands.

Gen. Porphyrio, Temm.

1. Purple Gallinule (*P. martinica*).—Very rare. Only one specimen is on record, taken near Halifax, Jan. 30, 1869, after the severe southerly gale in which the City of Boston was supposed to have foundered.

Gen. Fulica, Linn.

1. American Coot (*F. americana*).—Common in the marshes and other suitable localities.

FAM. ANATIDÆ.

Gen. Anser, Linn.

1. Snow Goose (*A. hyperboreus*).—Very rare. Two specimens were shot on Halifax common some years ago, and preserved by Mr. Andrew Downs. The specimens of this bird obtained occasionally in the Maritime Provinces in spring are evidently stragglers from the migratory hosts which generally keep west of longitude 90 on their annual course north to the breeding grounds.

Gen. Branta, Scop.

1. Brant Goose (*B. bernicla*).—Arrives on its northern migration about the beginning of April, but is influenced like the wild goose by the state of the season. Vast numbers frequent our northern coast on the Gulf of St. Lawrence, particularly the shores of Picton and Cumberland counties, where they stay for two or three weeks awaiting the breaking of the ice further north, to proceed to their breeding grounds in Labrador and still further north, as we learn from Capt. McClintock's memorable voyage of the Fox, that he found a brant on its nest at Boothia Felix, Lat. 71° N., on June 26, 1859. About the end of September they again cross the northwest portion of Nova Scotia on their migration south; and we have observed large flocks passing over Tantamara Marsh in Cumberland county as late as Oct. 26. The brant does not frequent the Atlantic or eastern coast of Nova Scotia as a rule, but makes the Bay of Fundy its usual course to the northward.

2. Canada goose (*B. canadensis*).—Our common wild goose. A few flocks undoubtedly pass the winter on our Atlantic coast, for almost annually during that season specimens are shot by persons along the shores, and therefore it is somewhat difficult to ascertain with certainty the date of the arrival of the southern migrants on their way north in spring. A flock of forty were observed Feb. 23, 1870, at Glace Bay, Cape Breton, going north. This is the earliest date we have recorded of their migration in a northerly direction. The unusually high temperature which prevailed over the Maritime Provinces during that month, had doubtless much to do with this early migration, if such it can be called, as the flock which had probably wintered on some part of the Atlantic coast, was enticed by the absence of ice from shore waters, as well as the broken state of ice in the Gulf of St. Lawrence, which was remarkable during that winter, to venture on their northern journey so early. In the early part of February, 1871, a small flock was observed outside Ship Harbor, Halifax county, and one shot and brought to town. Again, in January, 1879, a flock of twenty frequented the coast between Lawrencetown and Cole Harbor, Halifax county. The most remarkable occurrence, however, as regards the appearance of wild geese here in winter, took place on Dec. 23, 1883, a most inclement day, when the thermometer fell to 15° below zero, with a stiff northerly gale, a flock of wild geese passed over Halifax city, steering for the entrance to the harbor. Again, as late as Dec. 13, 1884, a flock of thirty passed over King's county, close on the Bay of Fundy.

From these facts and others with which we could supplement them, we may conclude to a certainty that a few flocks of wild geese do winter here.

Although, as we have before remarked, owing to these stray flocks wintering with us, and moving from one point to another, it is difficult to ascertain the true date of the arrival of the migratory bands from the south; yet we venture from our record of observations made during the last twenty four years to state that the earliest arrivals may be set down as usually occurring from the 6th to the 12th of March; but should the temperature be lower than ordinary at that period, and the weather be severe, the migration is delayed until milder weather occurs. Sometimes it so happens that a week or ten days of unusually mild weather occurs early in spring, which has the effect of bringing to our province the leading columns of migrants, and the sudden change to a low temperature again which frequently takes place on such occasions and that for a prolonged term, proves most disastrous to the geese. In the last week of February, 1880, the weather was remarkably mild, as may be imagined when we state that flies were observed buzzing about in the sun in sheltered spots on the 28th of that month. This had the effect of bringing up the geese. On the 26th of March began a cold spell which lasted off and on for a fortnight, accompanied by snow storms, freezing up the country as in the depth of winter. The poor geese, unable to find food, were reduced to great extremities and became so weak and tame that numbers were killed by boys with sticks; but when killed were hardly worth having, so emaciated had they become. In the spring of 1882 the geese also came up too soon to proceed north and were obliged to remain with us even to the end of April, for the St. Lawrence was covered with ice, and the coast of Prince Edward's Island as late as the 20th of that month, according to a local paper, had an ice belt even on its northern shore "extending at least eight miles out without flaw or crack, thirty inches thick, and in all respects as safe as any day during the winter."

The numbers of geese which pass over Nova Scotia vary greatly, in some seasons not a tithe of the usual quantity being observed. May not this be attributed to the geese sometimes preferring to make their journey north a few degrees to the westward to escape the storms of the Atlantic coast which are occasionally very severe and continuous about the time of their migration? It is very rarely indeed that the geese pass over this province on their migration south in autumn, and we have only recorded a few instances of stray flocks being observed to do so.

How far beyond the latitude of Hudson's Bay this species proceeds in spring to breed is difficult to ascertain from published reports; but it is very probable they tenant all the waters of the Churchill and Mackenzie districts to the borders of the Arctic Sea, if not still further north. According to Barnston it is plentiful during the whole winter in mild seasons on the Pacific coast of British America.

Gen. Anas, Linn.

1. Mallard (*A. boschas*).—Not common. Occurs occasionally in companies of a few individuals, when the marshes overflow in autumn.

2. Dusky Duck (*A. obscura*).—Our common wild duck. Very common; breeds about the inland lakes and rivers; also in numbers on Sable Island, situate some eighty miles out at sea from Halifax. Many stay all winter, frequenting the bays and inlets of the Atlantic coast.

Gen. Dafila, Leach.

1. Pintail (*D. acuta*).—Not uncommon. Occurs in the fall with other migratory ducks.

Gen. Mareca, Steph.

1. American Widgeon (*M. americana*).—Rare. A pair, male and female, where shot at Sambro Island, Halifax harbor, a few years ago, and are now in Mr. Egan's collection.

Gen. Querquedula, Steph.

1. Green-winged Teal (*Q. carolinensis*).—Common.

2. English Teal (*Q. crecca*).—Accidental. Mr. Downs informs us that one was shot near Halifax in September, 1854.

3. Blue-winged Teal (*Q. discors*). Common.

Gen. Spatula, Boie.

1. Shoveller (*S. clypeata*).—Very rare. In the first week of April, 1879, two males in fine plumage were shot at Cole Harbor; one being preserved by Mr. Egan for a gentleman in Halifax.

Gen. Aix, Swains.

1. Summer Duck (*A. sponsa*).—Not uncommon. Breeds about the large inland lakes.

Gen. Fuligula, Steph.

1. Greater Scaup (*F. marila*).—Not common.

2. Lesser Scaup (*F. affinis*).—Not common.

3. Redhead (*F. ferina*).—Very rare. One was shot recently at Sambro Island, Halifax harbor, and is now in Mr. Egan's collection.

4. Canvasback (*F. vallisneria*).—Accidental. Only one specimen known, which was shot at Sambro Island in 1881, and is now in Mr. Egan's collection.

Gen. Bucephala, Baird.

1. Golden-eye (*B. clangula*).—Common. Known to the fishermen as "widgeon" and "whistle-wing."

2. Barrow's Golden-eye (*B. islandica*).—Rather rare. As sociates with the preceding on the shores. Until Dr. Bernard Gilpin's valuable paper "On the Golden-eyes and Garrots of Nova Scotia" [Trans. N. S. Inst. Nat. Sc., Vol. IV. p. 390.], the two species were considered here as one. Dr. Gilpin thus remarks on the anatomy of the birds: "While finding little or nothing in the parts of reproduction, the ovaries and testes, I unexpectedly found in the male birds so great a difference in the shape of the windpipes as at once to mark a different species. This difference is much more easily seen than described, as is readily shown in the plate. In the male common golden-eye, the windpipe soon after leaving the throat and before it enters the breast, has a very sudden enlargement, almost as it were a broad hoop thrown obliquely around its stem. On the inside this leaves circular pouches on the posterior surface before the restriction of the pipe takes place again. In *islandica*, the windpipe simply and gradually enlarges itself, becoming restricted again before it enters the breast. In one the enlargement is suddenly from two-eighths of an inch to an inch and an eighth, while in the other from two-eighths to five-eighths, and that with no protuberances. In the males alone of both species there is, after the windpipe has entered the breast, that very complicated sub-quadrangular knob from which the bifurcation of the pipe proceeds. This form is common in a modified degree to other species. According to our present ideas of species, this great divergency in form of windpipe, existing in the male though lost in the female, must mark them as two different species, although in the males a little more or less white on head and back, a little purple reflection in one, and a higher base of bill and forehead marks the only difference, and in the females as regards color, no difference can be found. The tails, wings and feet of both, in the most minute examination, affording no differential types."

3. Bufflehead (*B. albeola*).—Very common. Frequents the rivers and ponds at the close of summer on arriving from the north, and resorts to the sea coast in winter. Leaves for its northern breeding grounds about the middle of April.

Gen. Harelda, Leach.

1. Long-tailed Duck (*H. glacialis*).—Known on the coast as "cock-a-wee." Very common throughout the winter months all along the Atlantic coast, frequenting the open water of the estuaries in small flocks. For its size, we should imagine that it possessed more blood than any other duck, for, after being shot, it runs from the bird in a perfect stream. No wonder that it braves the severest weather when we take this fact into consideration, coupled with that of its also possessing an extremely dense coat of feathers and down, quite equal to that of a grebe. The flocks that come inshore are generally composed of young males and females, the old birds keeping outside.

Gen. Camptolæmus, Gray.

1. Labrador Duck (*C. labradoricus*).—Very rare. Only one specimen known to have been taken, and that was about thirty years ago. It was purchased after preservation for a private collection in New York.

Gen. Histrionicus, Len.

1. Harlequin Duck (*H. torquatus*).—Not common. The male is known as "lord" by the coast people, and from the beauty of its plumage always finds a purchaser in Halifax markets when a specimen is exposed for sale.

Gen. Somateria, Leach.

1. Eider Duck (*S. mollissima*).—Very common. The male is known as the "sea drake" and the female as the "sea duck." About the end of April or beginning of May numbers of these birds frequent the coast, mingling with the countless hosts of scoters, as they ride on the sea just outside the breakers. Breeds.

2. King Eider (*S. spectabilis*).—Rare; specimens occasionally obtained. It is known on the coast as "bottle-nose drake."

Gen. Œdemia, Flem.

1. American Black Scoter (*Œ. americana*).—Known on the coast as the "coot," "courting coot" or "yellowbill." Immense flocks frequent the Atlantic coast of this province and afford good gunning to the fishermen in winter and spring, when the boats of a whole fishing station will turn out to blaze away outside at the flocks as they fly from point to point. They emit a peculiar wild note while lying on the water together. Mr. W. Winton informs us that one James Piltello, of Gloucester, Mass., informed him that some years ago while fishing on the Grand Banks of Newfoundland he took three of these birds, undigested, from the stomach of a halibut. The ducks had, no doubt, according to habit, dived down to the bottom in shallow soundings in search of food and were snapped up by the voracious ground-feeder.

2. Velvet Scoter (*Œ. fusca*).—Not uncommon. Known on the coast as the "white-winged diver" or "harbor coot."

3. Surf Duck (*Œ. perspicillata*).—Common. The male is known as the "king coot" or "bottle-nose coot."

Gen. Erismatura, Bonap.

1. Ruddy Duck (*E. rubida*).—Formerly rare, but of late years somewhat common.

Gen. Mergus, Linn.

1. Goosander (*M. merganser*). Not common.

2. Red-breasted Merganser (*M. serrator*). — Common. Known on the coast as the "sheldrake;" the female "sheldduck." It frequents the larger lakes of the interior in summer during the breeding season. It is also found at Sable Island, and breeds there.

3. Hooded Merganser (*M. cucullatus*).—Very rare. Three specimens only, young birds, have passed through Mr. Egan's hands, one of which was shot at Lawrencetown, the first week in November, 1884.

FAM. SULIDÆ.

Gen. Sula, Brin.

1. Common Gannet (*S. bassana*).—Not uncommon. Specimens are occasionally offered for sale in Halifax market. Breeds at the Magdalen Islands, Gulf of St. Lawrence.

[TO BE CONTINUED.]

RANGE OF THE AMERICAN BISON.—*Editor Forest and Stream:* In reply to Mr. J. A. Allen's question in FOREST AND STREAM some time since: To my knowledge there is but one herd of bison in Colorado. They number about forty. As their range is well out of the way of travel and is very seldom visited by hunting parties, this little remnant of what was a few years ago a large herd, is still to be found. Occasionally one wanders away and sometimes extends its range into South Park and is shot. The occurrence there seems to excite considerable comment and many wonder where they come from, but as the few who know wisely keep quiet the game butcher has not found them yet, and I only hope that this may not catch the eye of any such and that we may be spared these for a few years yet.—BONASA.

[We have omitted to print the locality as given by our correspondent, but have communicated it to Prof. Allen.]

WHITTIER AND THE BIRDS.—It was during one of these delightful pleasures that our friends proposed to call at Oak Knoll, the rural residence of Mr. Whittier. The lateness of the season had prevented the usual visit of the latter to the White Mountains. We had, therefore, the pleasure of his company during a short tarry. The grounds at Oak Knoll are exceedingly beautiful; so refined in the sense of landscape gardening, as well as naturally diversified in a marvellously delightful manner, that it becomes a matter of quite unanimous feeling to adjourn to them promptly. The sweet notes of the song sparrow in the hedges near suggested to Mr. Whittier the subject of song birds of America, and in answer to a question he declared his preference for that humble bird, adding though that he could not pass by the woodthrush as in any degree less sweet. The woodthrush seems to retain here more of the shyness traditional in the history of this bird, since, though in Central Park, it is one of the most common, the ladies of this household were not able to catch a fair view of the bird, though its musical notes are constantly heard. Our host had a keen apprehension of the beauty of form as exhibited in single trees. Several large examples are here growing in all the perfection of their natural typical forms. We have seldom seen such charming diversity in such comparatively limited grounds. There is room for the display of several very choice trees in their full sweep, their branches lying flat upon the ground; notably the larch, but a chestnut of great size throws out a limb horizontally, which leaves the trunk at about five feet from the earth, and reaches according to our pacing forty feet in length. Records of lightning striking twice in the same place are rare. Mr. Whittier pointed out a tree near the house that has received such attentions. On going through the delightful tangle at the rear of the house we ran near a rabbit pen which contained several pure white pets. The loud gobbling of a turkey suggested to our host an account of the fierce and persistent hatred manifested by a turkey gobbler toward General Gordon, of Eastern fame, which he had been reading, and which corresponds, he said, with his own experience—this gobbler being so vicious as when at liberty to make savage attacks on him, forcing him when hard pushed to imitate the tactics of Gordon, which consisted in seizing the head of the bird, forcing it under a wing, and then rapidly whirling the body until the creature grew sleepy or dizzy from the movement. A fine mockingbird, in captivity near the house, suggested again the subject of songsters, when Mr. Whittier related an incident new to us. Haverhill, Mass., is his birthplace, at which place, he says, the ornithologist Wilson, in 1812, during the war, when all were on the alert for spies, was found wandering in the woods, dressed peculiarly and carrying a gun. The authorities arrested him as a spy, when the embarrassed naturalist at first found it difficult to establish an identity. Mr. Whittier expressed a fondness for Wilson's writings on birds, as compared with Audubon's, the poetical features of Wilson's writings being of considerable worth. He related an instance of unusual talent for picturing birds seen in the case of an old farmer near his place. Late in life the farmer had procured materials and had painted in water colors pictures of a large number of native birds, that are of exceptional excellence both as portraits and works of art.—*Correspondence N. Y. Evening Post.*

GRASS PLOVER WILL NOT READILY DECOY.—It has been my experience that grass plover will not come to stool either the wooden ones or dead specimens of the bird propped up to resemble the living. They are not sociable, and I have no doubt it will be found to be the same experience of other sportsmen.—HOMO.

Camp Fire Flickerings.

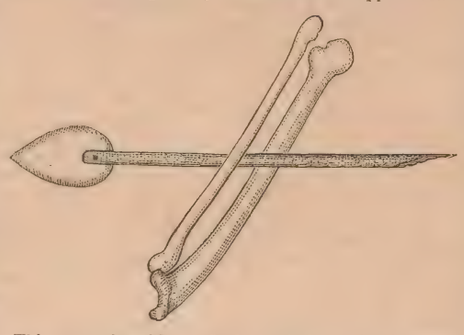
"That reminds me."

165.

A PARTY out on Bow Lake were pickerel fishing through the ice, when a big farmer boy strolled down to see how they were doing. He sat down by the fire, when the fishermen began to interrogate him about the best places to fish, and how large fish he had seen caught. Among other stories he told was one to the effect that his "dad," fishing through the ice, had hooked a pickerel that gave him hard work to pull in, and in trying to get it through the hole its head pulled off, and his "dad" took it home and the head weighed seven pounds. Thereupon Bill Blank, who was the wag of the party, cut the head off from a four-pound pickerel, and unobserved by the boy hooked it on the trap nearest to where the party were seated quizzing the boy. Bill then went over among the others, and soon managed to get the boy's attention drawn to the sprung trap, and boy-like he jumped up and ran for it, and started pulling it in, while the party were tickling all over at the expected surprise the boy would get in pulling out the head, "same as his dad did." But he didn't surprise worth a cent, for in pulling it out, in the most unconcerned fashion, he exclaimed: "Say, Mister, you better put on a fresh bait; he has chewed this one all off but the head." A. MAC.

166.

Scene, a country general store, where everything is sold, from a pin to a hoghook. The conversation had drifted on to "imagination." "Speaking of 'magination," said old Ike N., "I'll jist tell ye a little sarkimstance that once happened to me. You see, I used to git a little 'off' sometimes, and one morning when I got up feeling kinder 'owley' like I went an' looked out inter the orchard, and thar sat a blamed big owl in one of the apple trees. Says I to Jim—that's my boy, ye know, what's gone out west now—'Jim, get me old Williams'—that's that gun I sold to Gus Marshall—'What do you want her for?' says Jim. 'There's a big owl out in that medder-sweet tree; and be quick about it.' That brought the old woman up, too. Ye see, she had lost some chickens lately, and she kinder took an interest in it. Jim brought the old gun, I histed the winder kinder careful like 's to not skeer him, and hang me if I could git that old churn to pint at him. The old woman says, 'Where's your owl? I don't see none.' 'Out there in the fust tree, don't you see him?' 'No,' says she, 'nor you nuther, but if you'd had about three more drinks of Jim Brown's whisky last night I reckon you would see two owls.' 'Don't you s'pose I know an owl when I see one? I haint lived sixty years in the woods and then not know an owl when I see one?' 'Well, you might see one but I can't,' she said, and she reached up a picked the biggest hayseed out of my eyebrow you most ever sot eyes on. 'Guess it must be,' says I, 'the owl's gone anyhow,' and sure enough, there that blamed hayseed was stuck up in my eyebrow, and I took it for a bird six rods off. I tell you, boys, 'magination's a great thing." FLICKER.



Game Bag and Gun.

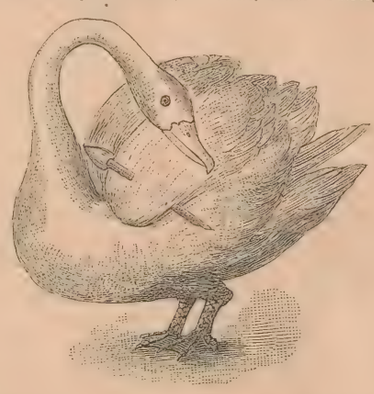
WEAPONS IN GAME.



Editor Forest and Stream:

A male swan was killed near here three years ago this spring on his migration north, that carried between the arm bones (radius and ulna) of the right wing an arrow, bone-shafted and copper pointed. The shaft, as nearly as I can explain, is made from the foot bone (meta tarsal) of one of the seal family, and is eight inches long, beveled at the string end so as to be spliced to another portion in order to lengthen the shaft. A slot in the other end contains the copper head, which is riveted in place by a well-fashioned copper rivet.

This arrow is without doubt entirely an Arctic production. Copper in its pure state is found in abundance along the borders of the Coppermine River, but the head of this arrow did not come from this source as it is fashioned from manufactured (rolled) copper. Arctic explorers of late years in the vicinity of Back's Great Fish River, Boothia and King William's Land, have often found among the Esquimaux weapons and utensils fashioned from various manufactured metals. Who knows but what this arrow head might have been made of copper from one of Sir John Franklin's ships, the stranded Erebus or Terror?

The swan mounted, with arrow in place, is now an ornament in a family house at Painesville, Ohio. Photographs

were taken of the mounted bird, one of which was sent to the Smithsonian Institute, Washington. I am now trying to have the owners of this specimen of migration donate it to the Smithsonian.

For many years the fishculturist has marked his brood to see if in the course of time the seed put in the water by him would return again and recompense him for his labor. We now know it to be a fact that industry in this way does not go astray. The fish eggs hatched and cared for at the fountain-head turned into the stream will give full satisfaction in time; so fecund is nature and always pays her debts. What if we could label every bird that takes his journey from almost at the tropics to within the Arctic region, and find out his story after he had raised his northern brood and started for his warm winter home. What a wonder of wonderful stories we could record; but unfortunately we are limited in acquiring the workings of these winged wonders of the air. And so when we meet with a bird like this that has carried in his wing the mark made by the Esquimaux possibly in the spring and killed the following spring on its way north after winging its way for many hundred miles in its migration, we may well consider and begin studying this that is little understood, the law on wonders of migration which governs animal life.

As a study in the way of the birds in the air, I think the history of this noble swan with the Esquimaux's arrow in his wing worth recording. DR. E. STERLING.

CLEVELAND, O.

Editor Forest and Stream:

I inclose a slip copied some months ago from the *Pioneer*, of Summerside, P. E. I.: "Last week a wild goose was shot in Richmond Bay and sold to Mr. Benj. Tanton, of St. Eleanors. While the bird was being prepared for cooking a large leaden bullet was found imbedded in its liver, completely encysted or covered with animal tissue, indicating that the bird had probably carried it for years. The bullet weighs an ounce, and was hammered round and not cast, as is usually done. The bird seems to have suffered no inconvenience from the additional weight, as Mr. Tanton informs us it was one of the best that ever came on his table." It is remarkable that the bird, although handicapped with such extra weight, was in more than average condition. I can vouch for the account being correct. D. H. MACGOWAN.

Editor Forest and Stream:

While skinning a male *Mergus merganser* for mounting I encountered a round bony substance about the size of a No. 1 shot fast to the backbone next to the skin and appearing as if a shot had been fired into the backbone and stuck into it and then been encysted. Upon cutting off the enveloping substance, I discovered the sharp end of a wire. Taking hold of this with the forceps and pulling with considerable force I drew out a piece of steel wire one and one-quarter inches in length encased in a bony cylinder. This wire, which I inclose, I think is part of a fish-hook and was pointed from the belly upward to and through the backbone.

C. T. RICHARDSON.

ESSEX COUNTY, New York.

THE BIG MARSH OF THE TANTRAMAR.

FOR abundance and variety of feathered game commend me to the Big Marsh of the Tantramar. The Tantramar itself is an oddity among rivers, and all the country about it is peculiar, indulging itself in a certain air of mystery. This country is the tidal region of New Brunswick, of miraculous and ever renewed fertility, which is slowly rising out of the sea into which it sank as slowly ages ago. The Micmac Indians hunted and fished along the scanty borders of these marshes, when first they began to re-emerge. Then the Acadian French came, and hastened the slow reclamation by long massive ranges of dykes. Then came the English and helped themselves to the fair inheritance. Now the Big Marsh occupies the greater part of the isthmus connecting Nova Scotia with New Brunswick. For miles and miles in every direction stretch the bright green levels, the heavy heads of the "timothy" bending before the sudden breezes, with here and there a broad yellow patch of salt salt grass, here and there a few acres of brown weedy mud, too wet for meadow, and here and there a chain of sedgy pools. There are no dwellings to be seen save on the far off skirts of the uplands, but a few barns dot the expanse. Through the green winds hither and thither the river Tantramar, of a tortuosity which Meander never attained to in his most circuitous mood. At low tide the channel is a vast yawning chasm of red mud, several hundred yards in width, and more than a hundred feet deep, along the bed of which hurries a brawling brook. Then the tremendous Fundy tide storms in through Cumberland Basin, and presently the Tantramar is formed into

"A full-fed river, winding slow
By herds upon an endless plain."

It brims the confining dykes, and floats mighty ships on its yellow bosom. All round the head of the Basin, outside of the barrier of dykes the marsh is fringed with acres upon acres of mud flat and sandy beach, of varying degrees of dryness and firmness. Over these flats fly swarms of rail, and sandpipers, and diverse kinds of small snipe. Here and on suitable ground inside are curlew. Great flocks of golden plover settle on the salter meadows and close-eaten pasture marshes. Yellowlegs drop everywhere by twos and threes with their forlorn whistle, and the ducks haunt the reedy pools at sundown.

It was very soon after the arrival of the plover in force that my friend C. and myself decided to commence operations. Our base was not far from old Fort Cumberland, the Beau Séjour of Acadian story. An account of our first day on the marsh will serve as a specimen of the whole campaign, which we carried on for a week with eminent success. As in former papers for FOREST AND STREAM I have had to chronicle some rather humiliating failures, it is with the more satisfaction that I come to record a day's sport with which we were thoroughly content.

It was late in the morning when we set out, and for lunch we thrust but a biscuit or two and a cruller into our pockets, as this expedition was intended as a mere reconnoissance, and we did not expect to be gone above three or four hours. But the gods grant us our best days often when we are least looking for the favor—sometimes when we are least prepared to make the most of it. But our only lack of preparation on this day was our lack of adequate lunch; and this we in a way—a poor way—managed to remedy when the remedy came to be needed, as shall further on appear. As we made our way down a steep upland pasture, studded with clumps of the juniper shrub and huckleberry, C. shouted suddenly "There they go!" and pointed eagerly out over the marsh. There was a cloud of plover, wheeling uncertainly, disturbed by a team which we saw crawling along the black marsh road a half mile away. The birds finally settled in a wide muddy patch of salt marsh, whereon a herd of cattle was feeding. This ground was fenced off from the meadow lands surrounding it; and a line of dyke led along a small stream from the foot of the uplands to within fair gunshot of the birds. We lost no time, but plunged through a bad bit of swamp before us, gained the shelter of the dyke, and crept noiselessly toward our prey. A dozen paces more and we should have been upon them, when there was a trampling and bellowing among the cattle, and we lifted our heads in time to see an amateur bull fight commencing, which drove the plover off in a puff of gray wings. The flock swayed toward us, then swerved sharply to the right, showing a flicker of white from their under wings and pearly-tinted bellies. It was a splendid chance as they swerved; four reports rang out almost as one, and a bird dropped headlong to each barrel. We sprang over the dyke and rushed out into the field, ignoring the bull fight. How plump and soft and dainty looked the beautiful birds on the trodden mire of the field! How we admired them, and smoothed their roughened feathers ere we dropped them into our bags. The first spoils of the day, we knew no later ones could seem so rare and fair.

Meanwhile we had kept an eye on the departing survivors—of whom there must have been several hundred. They alighted near the borders of a tract whereon had just been cut the late "broadleaf" hay. There was no cover by which we could approach, but within range of the flock there was a low pile of fence rails. The ground between was slimy with showers that had fallen in the night, but we lay down flat and worked ourselves gradually into position behind the pile of rails. Then, having made whispered arrangements as to where each should fire, we sprang to our feet all prepared. Imagine our chagrined countenances as we saw that this produced no marked effect! In truth, the flock was circling in a leisurely fashion hundreds of yards distant. While we had been painfully worming our way through the mud, not daring to lift our heads, the plover had resolved upon departing for fresh fields and had departed forthwith. We sat down blankly on the rails, and saw the flock settle at last far off in the open. The only thing to do was for one of us to endeavor to "circumvent" the wily birds, while the other waited hidden behind the timber in the hope of a shot on their return flight. C. volunteered to do the circumventing. He thought possibly the birds were in range of a hay stack which we saw in the distance; and if not, he would do his best to drive them in my direction. So I lay down, covering the space before me, but in a very cramped position between two large unsplit cedar rails, and C. disappeared. My waiting seemed for an age, but at last I saw him rush

wildly from behind the far-off haystack, waving his arms and shouting. The panic-stricken plovers delayed not to make inquiries as to the nature of the apparition, but rose as one and made haste directly toward me. They were almost within shot and my fingers tingled, when suddenly they seemed to remember something and wheeled off to the left. They kept on thus till my position shut them from view, and I kept still praying they might come back. Then there was a soft flutter of wings right behind me. I was pinioned between the rails, but I wrenched my neck about, and there was the whole flock reconoitering my position from the rear. They discovered me as my barrels went up, and huddled close together for an instant. Of course I could take no aim. With both hands high in the air, my head nearly twisted off the neck, in the most absurd of postures I fired. Just a glimpse of fluttering feathers through the smoke, and I hardly dreamed that anything else had fallen. But as I wriggled to my feet and stepped forth, to my delighted wonder I found seven birds upon the ground. The shot had been fired upon so wild a chance that I did not look upon it as a pot-shot, but was greatly elated over its result. And how C.'s eyes stuck out at sight of the spoils!

By this time the flock had vanished utterly, and we rightly concluded we should see no more of them, for that day at least, so we too sought pastures new. As we rounded a spur of the uplands we passed through an open swale, wherein we put up a brace of snipe, both of which C. brought down neatly. Then on the sunny slope of a dyke, among wild pea vines and ropes of wild convoloulus, we reclined to discuss our biscuits and too scanty crullers. As we lunched indolently three yellowlegs flew over us, and piped a note of startled inquiry. A little way off we saw a large reddish-brown hawk questing noiselessly above the tops of the long grasses; it was looking forward evidently to a dainty luncheon of field mice. Then a small flock of plover rose from a field in the distance, took a short flight and sank again. We swallowed our last mouthful of cruller and went in pursuit. Three birds were brought down this time, and then the flock made such effectual retreat that we could not dream of following. At this point the marsh was narrow and we decided to try the flats outside the dyke for a change. It would be a waste of time to enumerate the various smaller snipe and rail which we bagged out here. There were at least a couple of flocks of birds in sight all the time; and every flock was the most heterogeneous mixture imaginable. The result of a pot-shot made by C. into a passing swarm was eight birds, which turned out to be representatives of five different species. One of these is a very plump, short-legged and short-necked bird weighing as much as a jack snipe, slate-colored and without markings, which I know not how to name.

We bagged several curlew also, which we found poking their *retroussé* bills into the mud at the very edge of tide. Then the sight of a flock of plover called us in on the marshes again, and by dodging this flock persistently we got three several chances at it, and had only one miss to record. That miss was mine, but I retrieved myself later on. I had the delight of revenge upon C. for his mockery when he missed a fair chance at a duck. But I won't anticipate. When this flock of plover got away from us we realized that we were very hungry. But we could not think of going home. There was a most likely-looking series of ponds near at hand where we felt some ducks would come toward sunset, and we were fain to be on hand to receive them. There was yet an hour before we could hope for their coming, so we resolved to devote that hour to our stomachs. It must be borne in mind that we had not suffered ourselves on this day to go very far from the uplands. To the uplands we now returned, and coming upon an unprotected orchard, we ate our fill of a crabbed and sour little apple growing therein. Then we found a grove of birches, and armed ourselves each with a clean and firm piece of tough birchbark. These we twisted into something of the nature of a bowl, and with softened voices, many endearments, and our very tenderest smiles, we approached some cows that were feeding lazily near. Our demeanor had its effect at once, and we helped ourselves to some long, delicious draughts of new milk. On the edge of the marsh, moreover, we espied some well-fruited beds of cranberries, which went most excellently. Then heedless of the possibilities of cramps, etc., on the morrow — possibilities which were never realized — we wended our way across the grassy acres to the pools, where we hoped for ducks.

To the very brink of the most promising pool—indeed beyond the brink and beyond the fringe of reeds—ran a worm fence, with long grass and weeds on either side of it. This was just to our heart's desire. Concealed in the deep grass we lay at ease, close to the water, and waited till our game should come to us. We didn't mind delay, for we were inclined to be luxurious by this time, and the sight of our already well-plumped game bags gave us a blissful sense of attainment. But the best was not yet—or, rather, as we spoke we looked up and saw the best coming. A whirr of wings and a line of seven black ducks drew swiftly toward us. Our arrangement was that each should fire at the bird or birds that were toward his own side. The ducks had plainly no intention of stopping at our pool, but they flew within easy range, and just as they got past all four barrels were emptied at them. The two hindmost birds fell to me, and the leader of the flock dropped in answer to C.'s first barrel; but his second charge went astray somehow, and he muttered an execration on his luck. An obedient cur which we had borrowed from a farmer waded in and brought our birds ashore. Three black ducks! We felt justly elated. Then all fell quiet again beside the lonely pool, which was beginning to flush warmly under the reddening west; and no voyaging bird could have guessed at the swift death lying in wait for it among those pleasant grasses.

Next a familiar low whistle greeted our ears, and two yellowlegs paused on wide wing, uncertain whether or not to alight. Just as the dangling legs touched the smooth surface we fired and saved them forever the trouble of coming to a decision. Every now and then came more yellowlegs, singly or in pairs, and found their way to our bags. At last came a solitary duck. It was C.'s turn. I had just time to mark it as a "golden eye," when C. fired, first one barrel and then the other, and the duck, with a horrified squawk, added fourfold speed to its journey. C. sprang up and gazed after it. Then he sat down with perfect meekness and endured my comments—a mere echo of what he had said to me on no remote occasion. When I had finished he humbly suggested that perhaps he had left the shot out of those cartridges, to which I replied, "Exactly!" After this there was another succession of yellowlegs, till it began to grow duskish, and we debated the advisability of going home. C. said wistfully that he would like another shy at those confounded ducks. And even as we were speaking the whistle of wings was on our ears again; then a splashing and quacking that thrilled our inmost souls, and there, under our very noses, was a flock of black ducks swimming and feeding in the pool. There was time to pick and choose what should fall to our first barrels. C. was fortunate enough to get two birds in range. So three were bagged at that discharge, and as the flock rose wildly we gave them our second. Result, five ducks. Then we rose also, dragged ourselves homeward with heavy legs but light hearts, put away a most unconscionable supper, and proceeded to display, count, admire, discuss, the booty of the day. I shall not here enumerate, as I think it would be hard-hearted to make men's mouths water unnecessarily, at a season when they cannot well go straightway to visit the Big Marsh of the Tantramar.

CHARLES G. D. ROBERTS.

FREDERICTON, N. B., March 4, 1885.

A HUNT ON THE YAZOO.

SAUNTERING along St. Charles street, in New Orleans, one bright day during the winter of 1853 (indeed all days are bright there), I was hailed by Ed Ball, a person with whom I had but a slight acquaintance, but whom I knew to be a crack rifle shot and a lover of the woods, qualifications quite ample to impress me in his favor at that time. He informed me that he had just received a letter from Yazoo City informing him that, in consequence of the open winter, there was but little likelihood of a rise in the Mississippi or its tributaries, insuring an abundance of game in the "Swamp," a locality lying between the latter river and the Big Sunflower, subject to occasional overflow, but most of the year as free from water as an upland meadow. Mr. Ball could not have made a proposition more to my liking than this. He also informed me that an acquaintance of his desired to be of the party, a Mr. Henry Radburg, a native of New York State, but for many years a resident of the Crescent City. (He proved subsequently to be a first-class wing-shot, a warm-hearted, genial fellow, and as true as steel. Although a good wing-shot, he was attacked by the "buck fever" badly one night when he and I were fire-hunting. He stood in the bow with his gun and myself in the stern guiding the boat down stream, when three deer came down to drink, so near to us that I could easily have cast a stone to where they stood. He deliberately fired three shots at them before they got away, and apparently did not displace a hair).

A few minutes sufficed for us to arrange preliminaries. I handed over to Ball one-third of the expenses necessary for provisions, ammunition, fare up the river, etc., he readily agreeing to attend to all details. He owned a comfortable tent and cooking utensils, which of course were indispensable in the woods. Had I known anything of Ball's antecedents I should never have chosen him as a companion in a hunting expedition where true courtesy and kindness between man and man are seldom wanting, and are an almost universal characteristic of the lovers of the chase. He was an unmitigated rough and cut-throat; had beaten an inoffending man to death in Kentucky and fled the State, and a large reward was even then offered for his arrest.

In a few days we were ready, so sending our traps down to the levee we were soon on board the steamer bound for Vicksburg. An evening of pleasant chat, enlivened by laughter and song, served to shorten the hours which seemed endless to hunters more than anxious to reach the sylvan solitudes which at that date had seldom been profaned by the tread of man. In those days game and fish were so abundant that no one ever thought of any necessity for protective laws. I soon after saw and appreciated the necessity for such laws; but we were young then and bent on sport. We retired, and were lulled to sleep by the plantation melodies of the negro deck hands, who solaced their hours of labor with song and legend. Morning came, and before we were thoroughly awake the steward with his fearful gong announced breakfast and Vicksburg. After breakfast we took a stroll through the town. In our loiterings a stranger pointed out to us a house as the residence of S. S. Prentiss. This had an especial interest for me, as I had read the public speeches of that gentleman as well as listened to his oral efforts, and I never knew his peer, except in the person of my friend, the late David Wilson, of Washington county, N. Y. This was the only point in the town that interested me, save the wharf-boat, where seven gamblers had been made to walk the plank by the outraged citizens, one only out of the gang escaping.

An incident on the up trip is worthy of note. At dinner on the previous day an old gentleman boarded the boat at a woodpile, a designation which will be appreciated by all travelers familiar with the Mississippi in those days. He had evidently footed it some distance, and was perspiring freely. He seated himself at the table, and, without a glance to the right or left, seized the finger-bowl, which was then considered the thing at all polite tables, and emptied it. As he sat down he placed his hat—a black beaver—on the floor at the end of a side table, on which was placed a huge bowl containing a delusive egg-nog mixture called floating island; and presently the boat struck a snag which mixed things up sufficiently to empty the bowl into the old man's hat, and the "islands" floated in their new bowl.

After laying in some vegetables at Vicksburg we boarded our skiff, Ball and myself taking the oars, with Radburg at the rudder. A vigorous pull of an hour or more brought us to the mouth of the Yazoo, into which we rounded, and continued our way against a stiff current until noon, by which time my hands were fearfully blistered, and I suggested a halt for dinner. A fire on the bank soon enabled us to fry some bacon and make a pot of coffee, hard bread or sea biscuits doing nicely in lieu of regulation bread, with the relish which hard work and pure air generally give. Re-embarking we continued our way up until the lengthening shadows told us of the day's decline.

We had reached the mouth of Big Sunflower River, where we found an elegant camping ground. Landing, we put up our tent and prepared for supper and sleep. Opposite the camp a long sand-spit stretched near the other shore, and presently a flock of wild geese came along and settled there. Ball seized his rifle and shot one from the camp ground. This proved a welcome addition to our evening meal. Just before turning in I baited an ordinary perch hook with a piece of wild goose, and attached to about ten feet of line, cast it from the stern of the boat to which I fastened it. The following morning I went down to the boat and observing the line was taut, commenced gently to haul it in. You can hardly imagine my surprise to see a pair of enormous jaws following the hook without the least resistance. Of course I recognized the species to which they belonged—the catfish—but their size astounded me. I put my whole hand under the gill covers of one side, and with great effort lifted the fish over the gunwale. I will say nothing of the size of my capture, suffice it that the party enjoyed steaks from it *ad libitum*, and still a large portion was left to the buzzards. We then loaded up again and breasted a still more rapid current, and after rowing the entire day reached a fine plateau on the left bank, which was selected as our resting place for the night. The usual routine of camping followed. While my companions were getting supper I strolled along the river bank in the edge of the forest. Suddenly a snort, which I knew to be from a deer, attracted my attention. I turned in the direction of the sound and could plainly see a fine five-pronged buck gazing at the unwonted sight of our fire. Suddenly I heard a shriek which frightened me clear to my toes. The buck heard it, too, and without more ado he shot like an arrow from a bow into the forest and was gone. I went, but with undignified haste, back to camp. It was a panther.

The next morning we proceeded up the river about five miles, where, on an abrupt elevation, we pitched our permanent camp. We blazed roads in three directions, having the river for our base, and extended our marks on the trees subsequently as we had occasion to go further out. The woods had to me a most somber appearance. The trees, festooned from branch to branch with gray moss, had a depressing effect upon me, and illustrated the "valley of the shadow of death" mentioned in holy writ. But there is scarcely a situation in life from which some good cannot be extracted if one is inclined to look for it—

> "There is a pleasure in the pathless woods;
> There is a rapture on the lonely shore;
> There is society where none intrudes,
> By the deep sea, for there's music in its roar."

The chattering of the black squirrels, of which there were myriads, and the song of the birds enlivened the scene somewhat.

In preparing for our possible game, I sought some water-soaked logs for the purpose of getting the bark to roof our shed with, and while thus engaged (I was barefooted) I happened to glance downward, and there within two inches was a black Spanish tarantula. I think I must have jumped ten feet at least, and I lit on the bank, when I put on my shoes and stockings, and they did not leave my feet again until I arrived at New Orleans.

Opposite was a natural arbor, one of the most beautiful I ever beheld. Commencing at the water's edge and extending about sixty feet back was an open space with small trees on either side whose branches were drawn together and interlaced by climbing vines, forming a network as perfect as if laths or other artificial devices had been provided for the roof. The ruddy beams of the setting sun glancing through these lattice panes chequered the watery pathway and almost tempted me to explore this haunt of the naiads, but remembering that I was not web-footed, I did not. Besides an alligator might have settled himself in the lily-pads, or a black or red tarantula might be disporting overhead.

At supper on the evening of our first day a stranger suddenly emerged from the depths of the forest and saluted us. We invited him to join us, which he declined, and after satisfying himself who we were and what was our mission, he disappeared as suddenly as he came. He told us before leaving, however, that he had followed us from the mouth of the Yazoo to our camp, probably to gather from our conversation the object of our trip. He carried a rifle as long as himself, and of 1-ounce caliber. We subsequently learned in Vicksburg that he was an outlaw for whose arrest a large reward was offered, for he had committed a murder and was a fugitive from justice. If he had been satisfied we were after him, not one of our party would ever have left the woods alive.

A breakfast of hot coffee, fresh biscuits and fried bacon, and we were ready for business. Each took a separate course, and agreed before starting upon a signal—the screech of an owl—to announce our approach or a desire for assistance in an emergency. I took an up-stream direction, Ball down stream, and Radburg took the center. I wended my way through the cypress trees and underbrush, the stillness only broken by the chattering of the squirrels and the scolding of a jay. Approaching a branch that emptied into the river near the camp, I peered cautiously through the trees and presently discovered a drove of eight deer. I shot the leader, when the rest scattered, one crossing the stream and coming directly toward me, which I also brought down with my other barrel. Bending down saplings I soon had my deer suspended and dressed. The tugging of two deer the distance of a mile to camp was a very arduous task, and by the time it was accomplished I was ready for supper and bed. The latter was of primitive structure, but never in my memory, not even on spiral spring mattress or air bed, did I enjoy such grateful, unbroken rest as on our camp bed. We drove four crotched stakes into the ground, having the tops about a foot high, and on these we laid poles two ways close together, and then placed moss and leaves to the depth of about eighteen inches. On this pile, with our blankets around us, our feet to the camp-fire, we were soon lost in slumber. It was a bed to make the eyes of the most cheeky tramp turn green with envy.

The morning following I went alone to the rear of Hodgson's Landing, at the confluence of the Yazoo and Big Sunflower rivers. I believed that the mound which constituted the landing was of artificial formation and determined to explore it as far as I could. This I did, and exhumed some arrow heads and human bones, which I deposited in the museum in New Orleans. The geologist in charge pronounced the fossils to have belonged to a human being of gigantic stature, by comparison with corresponding bones in his possession. I believe, if the mound was thoroughly explored, many interesting relics of the mound builders would be unearthed. Returning to camp, being unarmed, I floated down stream using only my paddle to guide my course. I observed on the bank what I first supposed to be a log. As I approached in passing near enough to touch it with my paddle, I could see what it was, an alligator, and quite as long as my canoe. As I passed he turned over twice and sunk out of sight in the stream. I did not know whether to expect an attack or not, but I pushed the canoe ahead with all my strength. I glanced over my shoulder once or twice, but the saurian appeared no more.

Returning to camp we loaded up our skiff with deer, and Ball started for Vicksburg, where we shipped them to our friends in New Orleans. He reached camp at the end of the week, bringing with him some vegetables, notably some onions, and such onions! Some of them would cover a breakfast plate, and as tender and sweet as Bermudas. Ball was accompanied by his brother, who had the manners and evinced the instincts of a gentleman.

While Rodburg and myself were away on the following

day the brothers determined to change camp, without any intimation to us of their purpose, and on our return at night we found the place silent and deserted. Fastened to a post which had supported a corner of our game shed, was a peremptory order for us to take down the shed and remove it and whatever else remained and bring it down to the new camp, which we had to seek; and the notice was signed by the firm of E. H. & J. Ball. Night had set in, and being fatigued and hungry, we paid no attention to the order and commenced hunting for the camp-fire. On arriving, Ball, seeing we had not obeyed the mandate, would hear no explanations. It was then that his crankiness became apparent. That one of a party where all were equal should arrogate to himself the right to command his companions seemed absurd in the extreme. He stormed until bedtime, but we paid no attention to him, as it was evident the two would act together. When we retired at night Radburg noticed that Ball secreted a hunting knife in his breast, a very unusual thing. Radburg, giving me the wink, suggested that we together visit a deer lick hard by. This we did, and on the way he told me of Ball's actions, and we concluded he contemplated some evil. We carefully loaded our guns and put on fresh caps; returned to camp and retired, but did not disrobe. Three times during the night we observed Ball rise on his elbow and gaze intently first at one and then at the other. We slept "on our arms," as the soldiers say. When morning came the crank was as polite and affable as one could wish; but his treachery was apparent, and we determined to return home. So, when the firm left for the woods, we boarded my canoe and started for Hodgson's Landing, where we took steamer for Vicksburg and thence to New Orleans.

With the exception of the episode referred to, I was much pleased with my hunt and returned fifteen pounds heavier in weight by my month's sojourn in the Yazoo country. Our spoils amounted to seventeen deer, besides wildfowl, etc.

James D. Jackson.

THE CHOICE OF GUNS.—II.

"THE world moves." Improvement and progress are everywhere visible, and nowhere more noticeably than in our firearms. A quarter of a century ago "Frank Forester" wrote that the days of the flintlock were passed; that it had been superseded and displaced by the percussion gun; that "the most inveterate supporters of the old flash-in-the-pan system had been compelled to abandon their prejudices on the subject and conform to the progressive improvement of the arm."

But notwithstanding the enlightened views entertained by this writer he could not keep step with the march of improvement, nor anticipate the future development of inventions then in their infancy. When he wrote, Lefaucheux had but just applied the breechloading principle to sporting guns. "Frank Forester" quotes "Stonehenge's" description and praise of the new arm, but he avows that the praise is to him inexplicable, and proceeds at some length to ridicule the invention. "This gun," says he, "has no nipple, no possibility of being loaded and fired except with the identical cartridge prepared for it, which is, and can be, only prepared at the shop which supplies the gun. It is true the cartridge case remains in the gun and can be withdrawn and recapped and recharged a number of times; but apart from the inconvenience of lugging about on your person a hundred or two, if you expect a good day's sport, of these cartridges – since the idea of a sportsman sitting down in the middle of a snipe bog or a cock brake to recharge his cartridges out of a powder and shot magazine, which he must also carry with him is preposterous—what on earth is the shooter to do if he takes it into his head to visit the Himalayas, or the Rocky Mountains, or Canada, or the Cape, or any other distant shooting ground (by no means impossible to or unattempted by the British sportsman), where cartridges for the breechloading double barrels certainly are not to be found? Is he to carry with him, in heaven's name, a hundred barrels of cartridges on camel back, or mule back, or his own back, with the consciousness that these indispensables once used up his double barrel is of less use than a broomstick? The want of simplicity is enough to ruin any invention; and it needs no prophet to foretell that this must be inoperative except as a pretty plaything to be used at home."*

These sentiments were not, however, peculiar to Herbert; they found general expression among the writers of that day. Nor are similar sentiments peculiar to Herbert's time, but they find expression in later works. In a fresh edition of a book published a few years ago, the writer describes with some minuteness the lever-under-guard, pin-fire, breechloader; he insists there have been "no decided improvements in the original Lefaucheux model except in the modification of the machinery and a convenient method of separating the barrels from the stock;" he expresses his doubts whether the central-fire cartridge is an improvement on the pin-fire, and avers that if the pin-fire gun had come into general use before the introduction of the central-fire, the latter would never have been accepted.†

Indeed, improvements in firearms have followed so fast one upon another, that the breechloader described in any American work with which I am acquainted, how late so-ever the edition, is not the breechloader of to-day, in which alone the sportsman, as sportsman, and not as antiquarian, is interested. The lapse of half a decade of years has hitherto been sufficient to render any published description of breechloading fowling pieces obsolete; and if the future holds in store for us improvements so important and so numerous as the past has furnished, the fate of what is here written will scarcely be different from that of descriptive publications now obsolete. Notwithstanding the many objections that have been urged against proposed improvements and the many predictions of failure, the breechloader has displaced the muzzleloader, the top action has superseded the bottom-action, the center-fire has crowded out the pin-fire and the hammerless is fast taking the place of the hammer gun. Verily, the world does move.

And so I may safely assert that the days of the muzzleloader are "dwindled to their shortest span," and that for quail shooting, or any other sort of shooting to which a shotgun is adapted, you should have, or at least it is better to have, a breechloader and not a muzzleloader; that this breechloader should have a top lever and not a bottom lever; that it should be a center-fire and not a pin-fire; and, if you can afford it, that it should be a hammerless gun and not a gun with hammers.

I shall not endeavor to discuss the manufacture of firearms nor enter into the details of their mechanical structure, for, were I competent to the task, such discussion would be almost useless to you as a sportsman; but I shall freely give such opinions as experience, observation and study have enabled me to form, together with the reasons for these opinions when it is deemed necessary to state them and when they can be stated without too great prolixity; and these opinions, you may be assured, are unbiased and uninfluenced by any prejudice for or against any gun or gunmaker or any sort of obligation to any. I shall speak, as one sportsman to another, my plain thoughts, without arrogation, leaving experience to prove the correctness or incorrectness of my judgments.

Twenty-eight years ago a high authority in sporting matters asserted that if a man intended purchasing a gun below one hundred dollars he should by all means get an American and not an imported gun; and this opinion has been time and again repeated by later writers, and to-day finds constant utterance in the journals devoted to field sports. Since "Frank Forester" made this statement American gun-makers have made much progress—taken great strides in their art—of which those who reiterate the statement take no note. The statement is of itself still true, as true as ever it was, and twice and thrice as true; but the converse of it—that above a hundred dollars a man should buy an imported and not an American gun—is not true now, even though it was true a quarter of a century ago. For my opinion is fixed steadfastly that no American citizen should now be counselled to buy an imported gun of any price, no matter how costly, unless he is willing and able to purchase one of the highest grade and finest make, such as Purdey or Lancaster or Dougall, or a few others of the great London makers can alone turn out. Up to two hundred dollars certainly, and even up to two hundred and fifty or three hundred dollars I believe you can get an American made gun that is equal in every respect to any foreign gun to be had for the same money. I know that this is not the current opinion, or, at any rate, that this is not the current expressed opinion; that it is the fashion to sneer at American guns and to praise to the skies the so-called "works of art" that are put upon the market by Birmingham manufacturers as fine guns and sold at fancy prices.

It is pleasant to see a sportsman take pride in his gun; it is a good indication, fair evidence that he is a true sportsman; and I would not say aught to detract from this love of the beautiful and artistic in firearms. But I am weary of this affectation to discuss so many beauties in a thing for no reason except its foreign origin. I am weary of this depreciation of an article simply because it is home-made. I am weary of hearing nothing but praise of the English and fault-finding of the American guns. I am weary of hearing language used years ago by writers on this subject and applied by them only to the very finest London-made guns which sell in the market at five hundred dollars or more, repeated and applied to Birmingham guns, which sell at retail for less than half that price, and to which the original writers had no idea of applying their language. In plain words, I am tired of hearing that Clark & Sneider, or Lefever, or Hasdell, or one or two other American makers, cannot and do not turn out, at an equal or lower price, guns in every respect equal, if not superior, to any Clabrough, or Daly, or Green, or Scott, or Greener, or Westley Richards gun that ever has been sold in these United States for two hundred and fifty dollars or under. And I wish to distinctly avow that price and intrinsic value considered, I do not "believe in the absolute and unapproachable superiority of the English guns." I do believe that there are now, and for the future will be, guns made by American makers that are and will continue to be equal to the same grade of English guns.* I do not so assert because I am an American, or to please the patriotic American sportsman, and while proud of the achievements of American gunmakers, I am sure my judgment is not warped by feeling, and that so far as my knowledge of the subject extends, I can do equal and exact justice between the foreign and the home manufacturer.

And here it may be well to say that the very highest grade London guns are, beyond question, the most beautiful, as they are the most costly weapons in the world; and if you are willing to pay a good round price for the gun itself—its full value—and as much more for external show, buy a finest grade London-made gun. It is true that thirty-five per cent. *ad valorem* will be duty, and a considerable additional sum freight, insurance, consul fees, port dues, and the like; but I am assuming that you want the best and finest gun to be had for money; that you are willing to pay for display, and that the price is of no consequence so that you succeed in getting what you want. In this case, I say, order from one of the old London establishments, whose fame is world wide, one of its finest guns, and you will have as handsome a weapon as the world contains and as good a one.

But the number of American sportsmen that can afford to indulge in a luxury so expensive as the finest London gun is small indeed. More of them buy guns at one hundred dollars and under than go over that price; and for American sportsmen I write, and my purpose is to give them such aid as I am capable of giving, to getting the best value for their money.

If, as is usually the case with American sportsmen, you desire to purchase a gun for its intrinsic value, I have no hesitancy in saying that, let its price be what it may, you will get a better and more serviceable gun—more intrinsic value—for your money by buying an American gun than you can possibly get by buying any imported gun of any make whatever. Up to a certain price—which is variable, but which may be stated to be from one hundred and fifty to two hundred dollars—every dollar added to the price of a gun adds a dollar's worth of gun; but every dollar paid beyond the one hundred and fifty or two hundred dollars is so much paid for external show. When you go beyond three hundred dollars—that is, beyond one hundred and fifty or two hundred dollars for gun, and beyond one hundred or one hundred and fifty dollars for display—you should buy a London gun; but up to something like that price—unless you are willing to pay for the very handsomest and most costly finish—your investment in an American gun will be the better one.

And there is even such a thing as buying the cheaper grades of guns for show. I have even heard men talk and have read what they have written, about the "exquisite finish," "perfect balance," "elegant proportions," *et cetera ad nauseum*, of low-priced imported guns, and have heard and read their assertions that American guns of similar price lacked these essentials of what they were pleased to term "works of art."

If you are bent upon display, and have not the means to indulge in the genuine article, but must resort to pinchbeck, you may, for something like fifty dollars, buy a Birmingham or Belgian shooting-iron covered all over with cheap engraving; but, if you are alive after firing it off, don't say I told you to shoot it. Such a gun may never burst, but it is liable to burst; and if it fails, it is not the maker's fault. It is fully as dangerous to the shooter as to the game, and in all probability will, at the best, shake to pieces after a year's usage. The country is flooded with the class of guns to which I refer, marked with all sorts of fictitious names, such as Manton, Moore, H. Richards, W. Richards, Saxton, Arden, Evans, and the like *ad infinitum*. They are made to deceive, and the dealers know it; they are accessories before the fact to every death occurring from the defective construction of the guns. Yet, for paltry gain, they continue to set these man-traps for the unwary. No informed man will buy or use one of them, but the inexperienced are daily deceived with them. Avoid them as you would an infernal machine set to explode at your approach. Buy no gun, under any circumstances, upon which the maker is ashamed to put his name. Buy no gun marked with a fictitious name, whether it be a "Moore & Harris" hammerless made by W. & C. Scott & Sons, or the vilest "Moore" or "Manton" that ever was turned out by a German factory. Be not deceived by the "ginger-bread work" placed on low-priced imported guns, for you may be sure that beneath the "engraving," and concealed by it, are serious defects—dangerous deficiencies—in the weapon. You cannot buy a reliable and durable imported gun at fifty dollars or under; but from American manufacturers, such as the Parker Brothers, the Colt Firearms Manufacturing Co., the Remington Firearms Co., L. C. Smith, Harrington & Richardson, the American Arms Company, and perhaps one or two others, can be had at a net price of fifty dollars or under, a plain, sound, serviceable and safe machine-made hammer gun that will do you good service and will be worth every dollar you put into it. It will not, like the imported gun of the same price, be covered with engraving, but will be perfectly plain; it will not, like such a gun, profess to have "fine Damascus barrels," but will be exactly what it appears to be.

The sportsmen that buy guns at $50 and under usually buy them for service and not for show, and they cannot hesitate between the plain but reliable work of American makers and the vile products of foreign manufacturers. And his taste must be wretched indeed who can see more beauty in the tawdry, stamped, foreign work than in the plain lines of the American fabric.

On all guns, except perhaps a few of those that are made to order only, there is a list price and a net price. This is a so-called secret of the trade, but it is a secret so generally known to experienced sportsmen that its present operation is adverse to the interests of those only who are least informed, and who, as a usual thing, are least able to bear the oppression of paying from 20 to 40 per cent. more than their better informed and wealthier neighbors. No sensible man will object to paying the dealer a fair profit, but this way of discriminating in favor of one and against another, of imposing upon the ignorance of the inexperienced, ought, for its very unjustness, to have an end. The practical operation is about this: If I order a gun in my own name it will cost me $50, but if I get a retail country merchant, who never had a gun in his stock in his life, to make my order, I can get it for $35. Or, if I am acquainted with the system of giving discounts, I can buy a gun for $75 that will cost you $100. This is a vicious system. Even the largest dealers in guns and sportsmen's supplies sell most of their goods directly to the sportsmen or indirectly to him by the circumlocution above mentioned, and not to tradesmen to be sold again. Under these circumstances prices should be uniform and just. So much on this subject.

DAKOTA GAME AND SHOOTING.

AS I sit here in my office with a cool breeze passing over me, I cannot help but think how the people in the East must suffer from the heat. We sleep under blankets every night. Let me preface my series of letters with a word for the country, that the sportsman, who will read of the finest shooting ground to be found in the United States before I am through, may better appreciate the surroundings, and not carry the impression, as many do, that the society is composed of cowboys and Indians. I have lived here two years, having come from Pennsylvania for my health, which was so broken that no one thought I could recover. The trouble was with my lungs. I am well, and write this that any one seeing it may do as I did. We have one of the finest wheat growing countries the sun ever shone on. Last year there were grand crops, and this season it is the same. In a drive of five or six miles one may see ten thousand acres of as fine wheat as it is possible to raise.

There are beautiful farms to be had for the taking. The climate is the finest I ever saw. I came from Williamsport, Pa., where the climate is ever changing; here it is cold in winter, but dry and clear, so that one does not feel it. The society is just as good as in any country or city; the people enjoy life better. The ladies ride horseback and drive till their cheeks glow with health. Bismarck is located at the crossing of the Mississippi River by the great Northern Pacific Railroad. It is admitted by all to be the future great city of the Northwest. We expect some two or three more railroads in here next year. Any one wishing more information about the country can write me as we want to see people come in.

This is the sportsman's paradise. But facts are better than talk. Last Saturday was the first day for chicken shooting. I got up in the morning, took my Indian pony, and as I had to be in my office at 9 o'clock, I took a flying trip with a friend to the country. We came in with nineteen chickens, quite enough for any two sportsmen to bag in a few hours so near town. Two of my friends went out the same morning, drove about fifteen miles out and came in with eighty-two, and another party with 120. This will give you an idea of the chicken shooting. We pay no attention to the plover, in my estimation one of the very best game birds. They are here from May till September in great numbers, and would be fine sport for any one not spoiled by seeing larger game.

Last evening I took my wife and dog—both being as fond of the sport as myself—we went out for a little airing, and within a half mile of the capital I put up two large coveys of chickens. I had a picnic. My dog being a little green flushed the first one, and I did not follow them up, so that I only got a few, but as many as I wanted, for my ice chest is full of them all the time. In my next I will speak of the geese and ducks, which come by the acre in October. The chicken shooting is splendid till cold weather, and the geese and ducks and deer come in in October. The fare is low from Pittsburgh. By getting a land seeker's ticket you get the round trip for about $50.

W. H. Williamson.

Bismarck, Dakota.

NATIONAL SPORTSMEN'S CONVENTION

THE following circular address has been issued: *"To Sportsmen of America:* The committee in charge of arrangements for the coming National Sportsmen's Convention, to convene in this city beginning the 29th of September, 1885, are receiving assurances daily from all parts of the United States, from hunting and fishing clubs, individual sportsmen and fish commissioners, promising to attend. Our objects are for devising means by which we can have more uniform game and fish laws in the several States, and more efficient means by which they can be enforced, and all true lovers of the gun and rod, whether in the East, West, North or South, should feel an interest. All the clubs in this city (about 20), are now arranging one of the grandest programmes for the entertainment of all visitors perhaps ever gotten up on any similar occasion, and as the committee desires to mail every club and all others a programme about Sept. 1, we urgently request that every true sportsman whose eye may meet this send the undersigned immediately the address of all clubs known to him, as well as those of individual sportsmen. In cities, towns and villages where there are no clubs, we suggest that sportsmen organize one at once, elect delegate to the convention and furnish their address to the undersigned. It costs but little to organize a club, and besides giving you a representation in the convention, you will be better able to assist in enforcing the game and fish laws of your State. Our brother sportsmen in the South are much behind those of the Middle, Eastern and Northern States in the organization of clubs. The work laid out for the convention should interest every true sportsman in every section of our broad land, and can be accomplished only by united action. Each organized club, with proper credentials, will be entitled to two delegates in this convention, but this need not prevent a greater number from every club and individuals attending and participating in the entertainments. All are invited. If you feel an interest in the cause we are advocating, we ask your attendance and prompt reply to our above request. We would also request that you have your newspaper notice this, that every sportsman may see it. Reduced fare on railroads, steamboats and hotels are promised. Address, H. C West, Chairman Committee, 114 Pine street, St. Louis, Mo."

DEER IN THE ADIRONDACKS.

Editor Forest and Stream:

Of late years I have been a guide in the North Woods, and have seen a good deal of the way of keeping dogs in the winter time. I know a party that keeps four hounds that never have a chain on them the year around. They were allowed to come and go where they pleased. In the dead of winter they would start off and be gone six weeks at a time, and would come back as fat as hogs, and the remark would be made that they "were almost wintered;" and as soon as they were rested, off they would go, and sportsmen coming into the woods the following summer would wonder what made deer so scarce, since they would have to go miles away to get a shot at a deer. It was a great pleasure to me last winter at Lowville to sign your petition to prohibit hounding. Most of the guides signed it. Some would laugh and say that "hounding would last as long as there was a deer in the woods, which would not be long."

Now, as hounding is stopped, is there no way of stopping "night hunting" in June? Eight deer out of every ten that are killed jacking in June are does which leave their suckling fawns in the woods while they come down to the water to feed. Met by some night hunter, they are mowed down with a load of buckshot, and their fawns are left to die in the woods, as they are too young to provide for themselves. One-third of the deer are wounded with buckshot and go off in the woods and die. I think that jack-hunting in June destroys more deer than the hounds do in winter when the deer are in their yards. If there are no hounds allowed to run in the woods, there will be no necessity for night hunting, as any ordinary sportsman with a rifle can get plenty of daylight shots at 100 yards, when they can see what they are shooting. This I call honest sport and not murder. Abolish the idea of loading a blunderbuss with buckshot, and paddling up within ten feet of a bewildered deer and blowing him to atoms. Leave gatling guns at home.

GUIDE.

TO PRESERVE DEAD GAME.

Editor Forest and Stream:

In answer to the inquiry of "W. L. P." in your last number, I wish to communicate my share of knowledge concerning the preservation of game, especially birds, during the warm season. The following is the method employed in the southern part of France, where during August and September the thermometer reaches often the same altitude as here in our glorious sunny South: It consists simply in drawing the birds, washing them perfectly clean and filling the cavity with sticks of wood or charcoal, so easily obtained by campers-out. The bill, ears and eyes should also be filled with charcoal dust to render the access of flies impossible, for the rapid putrefaction of meat of any kind is more attributable to the pest of the flies and their eggs deposited thereon than to the external heat itself. Birds stuffed in this way can be kept perfectly for six to eight days during the hot season. The process is as cheap as simple.

F. R. A.

NEW ORLEANS, La.

Editor Forest and Stream:

Submerging fresh meat in cold water will give best results. I have known of venison keeping sweet two weeks in cold boiling springs. It keeps best to remain in the skin, peeling off the same to get meat, from time to time, and keeping it folded closely.

CARIBOU.

HARVEY CEDARS.—New York, Aug. 21.—I have just returned from a week's outing at Harvey Cedars, Barnegat, N. J. The smaller varieties of snipe, including bay birds, beech snipe, ringnecks, etc., are quite plenty, but stool poorly. Willet, curlew, yellowlegs and the larger varieties of the snipe family, are scarce. A change in the weather is looked for before many days, when doubtless the larger birds will come in in more respectable numbers. An explanation may be found of the birds stooling so poorly in the fact that from Beach Haven to Barnegat Light the birds have to run the gauntlet of countless gunners. I counted at sunrise one morning five gunners on a stretch of beach near the Cedars not over one mile in length. Is it to be expected that any snipe in his right mind will come to the stools to be shot at a the face of such a fusilade?—WOODCHUCK.

DENVER, Colo., Aug. 17.—The annual meeting of the Standart Shooting Club was held to night. There was a large and enthusiastic meeting, and composed as it is of sportsmen, it was, of course, harmonious. The membership was increased from twenty-five to fifty, and the applications presented at the meeting were largely in excess of the vacancies, showing that our little club, with its exclusive shooting privileges (for duck shooting) is fully appreciated. The old officers were unanimously re-elected. S. H. Standart, President; J. S. Sedam, Vice-President; W. D. Todd, Secretary and Treasurer. The directors were authorized to enlarge our buildings and lease other lakes, so that it may be fairly said the club is now fully established. A truer lot of sportsmen and better class of genial gentlemen could not well be gotten together, who may not slaughter many ducks but will have a jolly good time.—D. [Among the club's prominent members are Captain Standart, its president, secretary of the Colorado Cattle Growers' Association; General John Pierce, State Fish Commissioner; Rev. Myron W. Reed, Colonel C. W. Fisher, ex-Governor Grant, Hon. Alf. Butters, and Messrs. Kinsey, Higgins, Bostwick and others.]

THE DEACON'S SUNDAY SHOT.—The grandfather of the Rev. Joseph W. Sessions, of Chaplin, was an exemplary Christian man of high standing in church and State, and a Congregational deacon. At a time of great scarcity of provisions, bordering on famine, the good old man spied a deer coming out of the woods near his house one Sunday afternoon, whereupon he seized his gun and shot it. For this act the church arraigned him for discipline. He pleaded work of necessity and mercy and justified the act; notwithstanding all this the church directed the pastor to read his sentence of excommunication from the pulpit, the deacon being ordered to stand meanwhile. As the pastor was about to read, the deacon reached behind him, took up his gun which he had secretly brought with him, leveled it at the pastor's head and said in tones of determination. "I forbid that paper being read from the pulpit." The pastor quietly remarked amid his astonishment, "All things are lawful unto me, but all things are not expedient. I do not think it expedient to read this paper."—*Mansfield (Conn.) Correspondence.*

A WARNING FROM ITALY.—Never buy a bigger gun than you can carry. This is a good rule for sportsmen. Here is a curious illustration on a big scale that ought to impress the lesson on prospective gun purchasers. The *World* says: "Italy has been anxious to surpass all other European nations in getting and owning the greatest guns. Hundred-ton Armstrongs were not sufficiently satisfactory, so Italy ordered in one batch four Krupp guns of 121 tons each. A gun of this kind, using 300 pounds of powder, is warranted to propel a 3,000-pound projectile nine miles, and once in a while to hit something with considerable force. But Italy now complains that it is in danger of getting altogether too much Krupp. In ordering the guns no preparations were made for their transportation, and the railway companies refuse to undertake a job which threatens to break down their rails and bridges. Even to carry a 121-ton gun a 39-ton car must be expressly constructed for it. It looks as if Italy had moved more hastily in the matter than the big guns are likely to do."

WILD CATTLE ON HOLLY BEACH, N. J.—It is not generally known that there exists on Holly Beach, N. J., a herd of perfectly wild cattle, the descendants of some blooded stock that escaped from a wrecked English brig that came ashore on "Five-mile Beach" many years ago. These cattle have become as timid as deer and frequent the woody marshes of this district, which afford perfect protection, unless driven by dogs to the gun, in which manner they are regularly hunted. During the past week the herd was seen, headed by an old bull, on the surf line of the beach, endeavoring to rid themselves of the greenheads and mosquitoes which had made the marshes intolerable. The beef of these cattle is said to be quite good, but from the nature of the ground in which they feed, often sedgy. Regular hunts are frequently organized, and twenty or thirty dogs are kept for the purpose of forcing them out of the woods to the hunter, who takes his stand repeater in hand, as in deer driving. —HOMO.

NEW HAMPSHIRE GAME LAWS.—A new law in New Hampshire is intended to still further protect game birds by forbidding the transportation beyond the State limits of woodcock, grouse, or partridge in the Fall or December, or plover from Aug 1 to Feb. 1, under penalty of a fine and imprisonment for each bird so shipped. A weak game law has existed before in our sister State, but this one extends the close period and is designed to put an end to the snaring of partridges by the thousand in order to ship them to the Boston market. It is hard to convict for snaring, but transportation is more conspicuous and easy of detection. The new law is designed to keep New Hampshire game birds for home shooting and consumption.—*Boston Advertiser, Aug.* 23.

NEW ANIMAL TRAP.—Hornellsville, N. Y., Aug. 16.—*Editor Forest and Stream:* In your issue of May 29, 1884, your correspondent "Tillicum," of Olympia, W. T., complained about the traps now in use, and the catch that often throws the animal's foot out of the trap. I would say that an old subscriber of yours, Mr. S. Dennis, has invented and patented an animal trap which has done away entirely with the defect of a catch over the jaw of the trap. They will soon be ready for the market, when Mr. Dennis will send you a sample trap and his "ad.," as he thinks that will be the best way to reach the parties most in need of a reliable trap.—J. OTIS FELLOWS.

FITCHBURG, Mass., Aug. 24.—Woodcock and quail are very scarce; partridge are very plenty. My companion and I, while out last week, started over forty by actual count one day, and you can judge how we wished it was the first of September. You would be surprised to see how few of those who call themselves bird hunters, know what the game laws of Massachusetts are; as I have to carry the FOREST AND STREAM of Aug. 20 in my pocket to convince them in many cases that they are wrong.—OLD PARD.

BUTLER, Pa., Aug. 20.—Game is very scarce here. We have a few woodcock, grouse, squirrels and no Bob Whites. Now insist on having our bird called by his proper name, Bob White.—Z.

GAME QUALITIES OF THE BASSES.

Editor Forest and Stream:

I have been very much interested in the articles in the FOREST AND STREAM on the fighting qualities of the large-mouthed bass. I never have taken large and small mouth in the same waters, Give them their choice and they will not live in the same temperature of water; for instance, in Round Lake, near Saratoga, you seldom find a small-mouth bass. The lake is shallow, muddy, and the water warm, and swarming with large-mouth bass. Follow up a small inlet for a few rods and you come to a small pond of cold spring water, there you find the small-mouth, but seldom a large-mouth. In some six or seven trips to these waters I have never taken a small-mouth in the lake, nor a large-mouth in the pond. As to their gameness under these conditions, there is no chance for argument. A one-pound small-mouth will show more fight, and take longer to land than a four-pound large-mouth will.

I spent the afternoon of the 15th of this month on Onondaga Lake near Syracuse. I wished most heartily for the member from Bigosh and the rest of the friends of the "cod-mouth." I took three small-mouth bass of about two pounds weight each. The water is clear, cold and deep. Not one of those fish were landed in less than five minutes, and my wrist is lame yet from the effects. Not one of them failed to hunt for the bottom in sixty feet of water, and foiled in that tried for the bank of weeds near shore. If you ever saw a busy boy I was one every second after striking one of those fish until they were landed.

Has any one of the large-mouth advocates tried these fish in both cold and warm water? In the Kinderhook Lake, a few miles from this city, the large-mouth predominates; in fact I never saw a small-mouth come from there. The lake is like Round Lake, shallow, muddy and warm, and the fish are all head, tail and skin; and after being stripped of these, if you find any meat left, it is muddy in taste; anything but a gamy fish to catch, or a game fish to eat. Let the friends of the large-mouth try them under these conditions and see if their argument has a leg to stand on. Mark you; I claim that the small-mouth will seek, and if he can find clear cold water with rocky bottom, will stay there and fight for his life to the last; while the large-mouth will take the warm shallow water, with plenty of weeds and muddy bottom, and as a fighter is no better than a sucker, and for the table worse.

Query—Given a ten-foot-six-inch fly-rod, reel below hand, and a good lively fish heavy enough to test the strength of the rod, what weight is the fish pulling at his end of rod, and what weight is the wrist sustaining at the other?

IRA WOOD.

ALBANY, New York.

DOWELS VERSUS SIMPLE-FERRULES.

Editor Forest and Stream:

The discussion of the dowel question in the FOREST AND STREAM has been quite interesting and is beginning to tell in the manufacture of rods, as there is constantly an increasing demand for rods without dowels; that is, rods of the finer grades. In connection with my business I have a repair shop, and have to repair many dozens of rods every year. My experience with jointed rods has been quite extensive in making and using as well as repairing. Rods without dowel are not entirely new. Some five or six years ago I had to repair a very fine lancewood rod that was made without dowels. The ferrules were waterproof. The male ferrule was capped or closed at the end by a neatly fitted piece soldered. The female ferrule had a metal diaphram soldered in at the point where the end of the male reached, making both waterproof. It was an excellent rod and had seen much service, yet the ferrules were in perfect order and had never given any trouble. My advocacy of ferrules without dowels dates from the time that I repaired this rod.

I can easily understand why ferrules were first used in the manufacture of jointed rods. In early times rod ferrules were hand-made from sheet metal rolled and soldered and were necessarily very imperfect in their fitting; hence the tapering dowel was introduced as a matter of economy. It cost less than it would to fit perfectly the ferrules without. The tapering dowel entering into a tapering recess could be shoved in until there would be no shake or looseness at the joint. Aside from compensating for loose-fitting ferrules, the dowel was an actual damage, as any man who has had much experience in repairing rods well knows. Often in boring the recess for the dowel the hole is bored deeper than the dowel. In many rods I have found the dowel hole as deep as the end of the ferrule and even deeper. Rods of this kind were easily broken. In others the dowel was so large that nearly all the wood was cut away to receive it. In this case, if the joints became loose by casting, they were sure to break by smashing in the center of the ferrule. Especially was this the case in ferrules that were made soft by heating to solder.

With the perfect machinery we now have for making solid drawn tubing, the fitting of one inside the other can be made so neat and exact that dowels are not necessary.

I will give what my experience has led me to believe the most perfect ferrules for jointed rods, and how they should be fitted on the wood. The female ferrule should be exactly straight and as short as practical, not longer than from 2½ inches to 2 inches, according to size. The female should be straight, that is, there should be no swell at the end to be fitted permanently on the rod; the end of ferrule that fastens to the rod should be beveled on the inside to almost a sharp edge, a short bevel. The wood of the rod should be the exact size of the outside of the ferrule, except a very little at the end, which should just enter the ferrule. Start the ferrule on by a few taps with a wooden mallet, then warm the ferrule and wood in the base of lamp or gas jet just warm enough not to soften the metal or scorch the wood; then drive on carefully with mallet. By repeating the operation of warming and driving slowly the ferrule can be driven to place, making the wood and ferrule almost flush without cutting a shoulder. As soon as the ferrule and wood have cooled the ferrule can be slipped off easily with the fingers. After slipping the ferrule off, heat a piece of rubber bicycle cement in a lamp or gas jet and rub a slight coat on the wood where the ferrule belongs; warm the ferrule again and drive in place. If this is properly done the ferrule will hold without pinning, also will be waterproof. One end of the male ferrule should be raised or swelled to about the outside

diameter of the ferrule, by this means the wood on which the male ferrule is fitted will be nearly as large as the wood of the female end. This is absolutely necessary in order to secure a true bow to the rod. By using short ferrules the stiffness at the ferrules will be lessened and the rod will bend in a truer circle. By having the ferrules swelled or raised at both ends, as is now the common custom, the wood of larger joint near the ferrules must be some larger than the wood of the smaller joint. This, by the abrupt stiffness not only affects the graceful bending of a rod, but actually makes the rod weaker at the joint by one side being stiffer than the other.

The male ferrule can be fitted on by heating and driving in the same way as the other, and afterward smeared with rubber cement. The open end of the female ferrule should be welded by a small bead around the outside edge, it will add much to the strength and is a necessity for short ferrules. In this way very short ferrules can be used and still be stronger than the wood, besides adding much to the suppleness and spring of the rod.

Ferrules without dowels that have by long use become worn so much as not to fit snug can be easily remedied in this way: Bore a hole in a piece of wood about one inch thick and wide enough to have from three-quarters to one inch solid wood each side of the hole. The stick should be eight or ten inches long with hole near to the end, the hole should be just the size the outside diameter of the ferrule you desire to shrink. Then with a saw slit the wood through the center of the hole to a few inches beyond the hole. Slip this on the part of the ferrule that is filled with the wood of the rod, then clamp the whole in a strong vise. Be sure to have the open end of the ferrule project beyond the jaws of the vise. By screwing hard with the vise the wood will close up where sawed and hold the ferrule firmly without smashing or bruising. Now have two other pieces of good hard wood about one inch square each and about one foot long; lay one on top the other; near the center put through two strong wood screws, having the screws about one inch apart. Between the screws, with the center of the bit in the joint between the stick, bore a hole the same size as the outside of ferrule. After the hole is bored take out the screws and with a plane dress a little less than one-sixteenth of an inch off from each of the sides that the bit cut through, then oil the outside of the projecting ferrule, screw on the clamp as prepared and revolve it around, moving it back and forth on the ferrule. By tightening the screws and repeating the revolving process you can shrink a loose ferrule to an exact fit in a very short time. In business this operation I often find necessary with new rods, as an imperfect fitting joint gives a rod a very unpleasant feeling in the hand. The operation of shrinking a ferrule in this manner is quite simple and easily done.

For the last five years I have used no other kind of a rod but the kind without dowels, and am more than convinced that rods without dowels are best for any kind of a rod, heavy or light. However, heavy rods are fast becoming things of the past. Sport ceases where labor begins. Handling a heavy rod is very much like labor. CALIFORNIAN.

COLUMBUS, O.

Editor Forest and Stream:

I was very much pleased to read the experience of Mr. H. P. Wells with a non-doweled salmon rod, as related in FOREST AND STREAM of August 13, and was much gratified to learn that his rod withstood so successfully the trying ordeal of killing twenty-five salmon. But while the result can be looked upon as a perfectly natural one, or as a matter of course by those anglers who have used this superior form of joint, it is perfectly incomprehensible to me why manufacturers still persist in using the dowel and tenon joint in any style of rod, for a rod joint that is good in one kind of rod must be good in all.

The success of Mr. Wells with the non-doweled joint, in both salmon and trout fly-rods, only confirms my experience of thirty years with the same joint in both light and heavy rods. One of the specifications for the Henshall black bass rod is for non-dowel joints, and I am assured by manufacturers and anglers that it has had the greatest influence in convincing them of the superior utility of this over the dowel and tenon joint. I have never taken a salmon, but I am impressed by the opinions of anglers who have fished from Nova Scotia to Florida, that the salmon is not so trying to a rod as a bonefish or a tarpon of equal weight; but however this may be, if a salmon fights as hard as either of these fishes, when of equal weight, he is certainly entitled to his distinction of furnishing the acme of fresh-water fishing.

During one of my visits to Florida I used for sea fishing a heavy Henshall ash and lancewood rod of eleven ounces, with flush joints, made by Abbey & Imbrie, and an ash and lancewood striped bass rod of fifteen ounces, with doweled joints, by another maker. With the former I killed redfish, drum, and tarpon up to forty pounds, crevallé up to thirty, bluefish as high as ten, and bonefish of five pounds —I cannot say just how many, but certainly hundreds of various sizes—and that rod is just as good to-day as when I first received it. In casting heavy mullet bait in this style of fishing the rod never came apart, nor was there the slightest loosening of either of the joints, in casting the bait or in playing a fish.

But my experience with the heavier striped bass rod, with doweled joints, was not so pleasant, for although the joints seemed to fit perfectly, no looseness or shaking being perceptible, they separated several times in casting, and once while playing a heavy fish, and it was at last rendered *hors de combat* by breaking square off just below the ferrule of the butt piece while casting, in consequence of being weakened by the tenon at that point. Now this was a handsome, well-finished rod, made of the best materials, and with as perfectly fitting doweled joints as I ever saw in any rod, and for which I paid a long price. I hold that the tapered dowel, in the correspondingly tapered tenon, will become loosened in its bed, like a wedge, from continual casting, and the joint will eventually separate. My experience proves it. Viewed in this light, a perfectly fitting dowel joint, that is, where the dowel is accurately fitted to a tapered tenon, is really worse than (as is often the case) where the tenon is bored perfectly straight; in the latter case the joint is formed by the ferrules only, for a tapered dowel in a straight hole is worse than useless.

While, as I have intimated, a long experience with both light and heavy rods (bait-rods and fly-rods) has convinced me of the greater excellence and utility of the flush, non-doweled joint, with short, cylindrical ferrules, over the dowel and tenon joint, I merely instance the two rods above mentioned to corroborate and affirm, so far as possible, the experience of Mr. Wells with his salmon rod. I have had light rods with doweled joints to throw apart or separate on other occasions, and have had them to break at the tenons, but I have never yet had a non-dowel joint to separate or throw apart in casting or in playing a fish, nor have I ever broken a rod in any of its parts, in actual fishing, that was fitted with flush, non-dowel joints. But then the dowel joint is "so English, ye knaw." JAMES A. HENSHALL.

CYNTHIANA, Ky., August, 1885.

Editor Forest and Stream:

Supplementary to the article of Mr. Wells, in the issue of Aug. 13, anent simple ferrules, let me add my testimony to his as to their great superiority over dowels. I have a 9-ounce Henshall bass rod with simple ferrules, which I have used for four years, and on which I have killed some pretty heavy fish, running well up into the 'teens, and the ferrules on it are as close a fit to-day as they ever were. But let me emphasize, by the recountal of a little experience of my own, his advice as to the necessity of having them fit so closely, that the ends of the wood shall be in contact.

A few weeks ago while at Detroit Lake, Minn., still-fishing from a boat, I laid my rod down, butt between my legs, joint and tip projecting over the gunwale, and proceeded to fill my pipe. The wind was blowing on my back, and, when I came to light a match I had to turn partially around to shield it with my closed hands. While thus engaged, some finny rascal took advantage of the situation to make a sudden dash for my bait. Under the boat he went like a locomotive, and before I could get at the rod, the butt ferrule had been bent completely in two. Whence I draw a double-barreled moral:

First—Never, when your bait is in the water, lay your rod in such a position that the reel can't render; and,

Second—In putting your rod together, be sure that the ends of the joints touch, which they didn't in this case, by half an inch. H. P. UFFORD.

CASSELTON, D. T., Aug. 19.

A TALE OF A LOON.

MY old friend, whose "remarkable catch" of a lost fishing rod at Sault Ste. Marie, published in the FOREST AND STREAM some time ago, calls upon me frequently at my office, and when he finds me disengaged is glad to talk with me about his more than half a century's experience as a fisherman. His reminiscences are always entertaining from their extended and varied character, and particularly so on account of the pleasant and quaint manner in which they are related. Here is an incident he told me a few days ago; it's another remarkable catch:

"A good many years ago, when our rivers and streams afforded plenty of excellent fishing, before their waters were polluted by the sewerage of cities and poisoned by the refuse from hundreds of manufacturing establishments and oil refineries as they are now—mind you, contrary to the law, too, notwithstanding our State Fish Commissions and the fish and game protective societies organized in every town and city—Christy A. and Billy F. and myself went to Lowell, on the Mahoning, to troll for large white salmon and pike. I never fish with those murderous spoons, as they call them, or artificial minnows with gangs of hooks on them, which lacerate and tear the jaws off more fish than are captured by lazy, unsportsmanlike fellows with them. I bait a single hook with a real minnow or a chub, and with a light rod and suitable tackle take my chances and give the fish theirs.

"Well, Christy and I got separated from Billy F. and we were having pretty good luck, but Billy had not a nibble. He became tired and thirsty, besides wanted to have a smoke, but couldn't find a match to light his pipe. He had been fishing along a rocky point—a first rate place too it was for big fellows. His bait was a fine lively chub, and he did not like to lose it, so he cast it as far out into the river as he could and stuck the end of his rod into a cleft in the rocks, then started up to town for refreshments. He had not been gone long, when a loon came swimming down stream, and dove and rose up again in front of us. I remarked to Christy that the loon was feeding, and if it got down a little further it might find Billy's bait. Sure enough when it next came up it had the bait in its bill. It made a great rush when it felt the hook, jerked the rod into the water and started away with it at great speed, the water flying from the reel five feet in the air, so fast was it going. Christy took the oars, I got into the bow of the boat and we went in pursuit of the loon. He would dive, come up for air, then go down again and so on, but for some reason could not steer well, tacked hither and thither. The water flying from the reel always showed us his position, and by making crosscuts we gained upon him, and at last were near enough for me to catch the rod. Then I had sport, the game was as strong as a fifty-pound pike and a deal livelier and called into play all my skill to save it. The chase continued for thirty minutes, loon rising and diving and splashing and straggling to break away, and we had to make for shore.

"When I got on land I began to reel in; there were about one hundred and fifty feet of line out, and when the line was shortened enough, we could see the loon in the clear water, and were surprised at its length, and observed how it used its wings under water just as in flying. At last he became wearied and we were enabled to get the landing net under him and lifted him out. Then we found the true state of affairs. The bird had taken the bait by the middle and when he bit it in two the hook slipped and caught in his shoulder in front of one of his wings, not in the mouth at all. That's why he had such strength. He was not much hurt and could breathe freely, and consequently gave a long and gamy fight. What should we do with him? We concluded to tie him up and take him home for the proof of our exploit. A loon's legs stick out behind you know, they can't stand up like a goose, and we had considerable trouble in securing our captive as we finally did to a seat in the boat. I forgot to say that a great crowd of people came down from the town to see the fun while it was going on, and bets were even on loon or fisherman. We got three cheers when we had gained the victory.

"We then began fishing again, and everything went along nicely for a while, till the loon took advantage of the first opportunity it had by jabbing its sharp bill with much feeling into a very sensitive part of Billy's anatomy just as he leaned forward to take a 'long pull and a strong pull' on the oars. With a cry of mingled pain and terror Billy threw himself forward, falling into the bottom of the boat, dropped the oars, and very nearly capsized the crew. Some moments elapsed before either of us took in the situation.

"When we did and quiet and equilibrium were restored, a council of war was held. It was agreed that the fight had been alike creditable to both parties—the killed and wounded were equal, and it was therefore decided to give the loon his liberty. He was untied, and without standing on the order of his going, tumbled overboard, dove beneath the water and came up again about fifty yards away. As soon as he appeared he gave a yell which might have been heard three miles off, no doubt to inform his mate that 'Richard was himself again,' and then began adjusting his ruffled plumage and preening himself in a manner which afforded us as much amusement as any other part of the whole affair. It made us feel very glad that we had acted toward him so magnanimously by giving him his liberty. For ten minutes he lingered in sight and continued to comb his feathers with his bill and claws, now and then turning his head from side to side in the most comical manner to look at himself in the mirrored surface of the water and observe the effect produced in his appearance. Then, with another scream he bade the party good-bye, dove up stream, reappearing again and again in the distance, each time further away; bound as fast as he could go toward home and Mrs. Loon, who was, I believe, anxiously awaiting him." H.

FISHING IN DAKOTA.

DURING the summer of 188—, while out on a land prospecting tour, we chanced to drop into the town of G—, on the line of the N. P. R. R., expecting to find some choice, unoccupied lands; but after carefully searching the adjacent country we were forced to admit that we had arrived about a year too late. The season being far advanced, we concluded to drop business and devote our few remaining days to the slaughter of the finny tribe. The next morning found us in a rickety wagon, behind two very small ponies, which appeared utterly unfit to drag the load of 600 pounds and over of humanity the distance of twelve miles to the lake, our objective point. We started from the hotel at 7 A. M., winding our way up through the steep coolies leading from the river bottom to the rolling prairies, upon which the excellence of the roads could hardly be surpassed. We then drove on for about two hours, the ponies alternately trotting and loping, as best suited their individual fancy, all the time, however, covering the ground in a way that plainly showed they could pile up a large score in one day.

Betwixt the departure and arrival at the lake, nothing of note occurred, excepting the way our approrch caused the numerous gophers to scamper off into their burrows. Our party had become rather anxious at the non-appearance of the lake, when suddenly our Jehu pulled up the ponies and then we beheld, on looking down the steep bank beside us, a most beautiful sheet of water about one and one-half miles long that appeared from our elevated position to have sunken down from the prairies, bearing high banks surrounding it, thickly studded with cottonwood trees and various small shrubs. It did not take us long to unload our traps and tether the horses, when we were ready for business. Then one of the party suggested that first we might better look for the boat, that our host in town had informed us was hidden in the rushes near by our present position; so all hands dropped their tackle and joined in the search, which resulted in our finding a good clinker-built fastened to a stake in the rushes. While searching for the boat we disturbed a mallard duck with a fine brood of ducklings, whose frantic endeavors to escape from our intrusion was very comical to behold, and the dexterity showed by the mother duck in leading her young away to a place of safety proved most interesting.

Setting traps and tackle in the boat, we then drew lots to determine who would be the first to row, as we intended to troll for whatever would bite. Friend A. took the oars, and when he had rowed out far enough we began to let go our lines, of which we had four. The last line had hardly payed out when No. 3 had a good strike, which threw us into a state of excitement. Each one of the party had some advice to give, meanwhile the lucky man was struggling manfully with his fish, that proved to be a pickerel of about six pounds, which, although making a good fight, was obliged at close quarters to succumb to the home-made gaff hook with which we had provided ourselves. The next two or three fish being under five pounds were thrown into the water, according to the custom of the lake. Presently our captain gave a sudden start which nearly upset our craft, and began to pull in his line in dead earnest. We expected he had a monster at last; the fish showed good fight, but it proved to be only a perch of one and one-half pounds. Here let me state that the perch found in the waters of Dakota are, as a rule, very gamy, and in fact offer as much sport as a good-sized pike or pickerel. On taking the average weight of the perch caught they tipped the scales at a pound each. With a six-ounce split bamboo and a large yellow moth great sport can be had with these fish near dusk.

We then began to have poor luck, and at last they ceased biting entirely. We were asking each other what might be the matter, when a small boy came out from the shore in a dugout, and kindly informed us that either we must keep in shore or else use a thumper if we wished to catch any more fish. Now as none of us had ever heard of such a thing as a "thumper" we shrieked at the urchin to learn the meaning of that word, and after considerable parleying we were given to understand that the said article was nothing more nor less than a five pound weight tied to the line about fifteen feet from the hook, which causes the line to sink, thus reaching to the large fish that lay in deep water. As we had nothing to make a "thumper" from, we decided to take the boy's first suggestion to hug the shore, so our oarsman was requested to get himself in motion, and we soon found ourselves skirting a lot of reeds along the shore. Hardly had our lines straightened out when the fish began to bite, and I never expect to enjoy such sport again, as we had our hands full pulling in the lines as fast as we possibly could. The water seemed fairly alive with wall-eyed pike and pickerel, of all sizes from one to eight pounds in weight. Never had we enjoyed so much sport before, and as the reader may imagine, we became rather excited, not to mention the snarling of the lines, etc. Upon reaching the end of the rushes, which extended for about 800 yards, we made a long sweep to turn the lines, returning over the same ground again three times with the same general result as before.

By that time it was about 3 o'clock P. M., and our captain suggested that as we only had about one hour more before our homeward start we had better try the "thumper" for a big fellow. However, what to use as a thumper being the question, all hands endeavored to find a suitable article without success, until the small man of our party gave a whoop like an Indian, enough to make one's blood run cold, and yelled out, "I've struck it, boys," and produced a small half-pound baking-powder can containing worms, which he dumped into the lake, and forthwith proceeded to jab a hole in each end with the gaff hook. Then taking his bag of brass shells, he removed the wads from about two dozen, dumped the shot from them into the can, first running the

line through the holes in each end, and putting on the cover nicked it so that the shot could not escape; and after tying a knot in the line at the required distance from the hook, the "thumper" was pronounced complete. By this time we had drifted into deep water, and after a few strokes of the oars the "thumper" was dropped overboard. Down it went to the depth of about fifty feet, and immediately we started on a direct line down the middle of the lake with a slow but steady stroke. Yet our party was doomed to disappointment, the "thumper" soon began to thump the bottom when at the other end of the lake, so we gave orders to "about ship" and try it once again.

We had nearly arrived at our starting point once more, feeling rather disappointed, when the man at the line shouted out to hold up a bit, as we had fastened to a rock or something on bottom. A moment afterward he exclaimed, "What a whopper!" and sure enough we had hooked a fish, and a game one at that, for he began to sink slowly although we tried to induce him to rise. After his Lordship had taken down about fifty feet of line he thought it best to move on, and then the fun began in dead earnest. First it was down, then up, and in all kind of ways did that fish try to get away, but it was of no use, for our lines would have held a shark. Presently he made a dart at the boat and then there ensued a scramble to pull in the slack, when, suddenly making a dive, he sent the line whirling out again; then up he came almost to the surface on the other side of the boat. The water being as clear as glass, we could see him as he lay perfectly motionless, excepting a slight quivering of the fins and tail. It was a sight to make the heart of any sportsman thump against his ribs to behold that muscalonge as he lay there, looking as large as a good-sized shark, and if anything a bit more savage. Taking hold of the line anew to give him another pull he darted off in a circle around the boat, a fatal mistake, for a good steady pull now brought him directly under the stern with his head just breaking the water, while the captain taking advantage of position, drove the gaff hook (in a most unsportsmanlike manner) through his back about amidships. Now began the tug of war between the captain and the fish; but as yours truly held the captain fast by the legs, it was evident that the fish must give up, which he presently did from pure exhaustion, and was triumphantly pulled into the boat. No doubt, our prize would have torn himself loose had not the gaff hook gone in under the backbone, thus making it impossible for him to tear it out. It was a sight, that fresh-water shark lying helpless in the bottom of the boat, and after all hands had recovered from the excitement, we made for shore, feeling very proud of our game.

On reaching terra firma our prize fish was weighed first, and found to tip the beam at nineteen and one-half pounds. The smaller fish weighed together one hundred and three pounds, which, with the big fellow, made the grand total of 122½ pounds to show for one day's fishing, not to mention the smaller fish thrown overboard, of which we kept no count. Then hitching up the team, repacking our traps, we started on the return trip, reaching home in time for a late supper, and all hands very tired, but willing to sit up all night to swear that Dakota cannot be beaten for the size and quantity of her fish.

In closing, let me state to parties who contemplate a trip to the waters of that country, that good tackle can be had in all country stores at Eastern prices, and to those who have not fished there, let me say that a good, stout bluefish line about one hundred yards long with the largest size Skinner spoon is the thing. A large spoon prevents the small fish from getting caught to any great extent. SCIPIO.

AGASSIZ AND ANGLING.

ON the 28th of last May, the seventy-eighth anniversary of the birth of Louis Agassiz, the Cincinnati Society of Natural History held a memorial service. The paper, "In Memoriam—Louis Agassiz," read on that occasion by Dr. James A. Henshall, has been printed in the Journal of the Society. It is a review of the life and work of the great naturalist, written by one whose veneration for the subject of his paper is manifest on every page. Speaking of the young Agassiz's taste for angling and studying the habits of fishes, Dr. Henshall says:

"Another writer says: 'Before he left school (at Bienne), he began to collect and study into the habits of fishes.' Now, the love of angling once firmly implanted in a boy's heart, it follows him through life, never to be wholly eradicated, but oftener to grow stronger with the accumulation of years, and not seldom influencing the whole course of his life. I know many men whose interest in natural history, and especially in biology, dates from the days of earliest childhood, when, with pin-hook and willow wand, they first essayed the gentle art, and produced consternation dire among the chubs and shiners of the brook. We, of the gentle craft, can readily imagine how eagerly young Agassiz turned from the wearisome school-room to the bright rippling waters of Lake Bienne, or to the foaming trout brook of the Jura, and can fully appreciate the happy transition from the musty books of classic authors to the fair, bright pages of Nature's book. It seems to me that these early impressions, and this first love, must have had the greatest influence in shaping his subsequent career, as we may presently see.

* * * * *

"When the boy Agassiz began collecting and studying the habits of fishes, the cell theory was unknown, but there was no minnow too small to escape his observation, and no part of that minnow too insignificant for his closest scrutiny and study. In this way he was the first to separate and properly define the most difficult group of fishes, the *Cyprinidæ*, as a family, by the form, number and arrangement of their pharyngeal teeth; and any one who has ever examined the minute teeth in the throat of a minnow, can appreciate, somewhat, the amount of careful study and observation involved in his investigations.

"In his study of the salmon, trout and grayling species, he exhibited the same careful and characteristic mode of inquiry. Of this family Günther says: 'As much time and patience are required for the investigation of a single species as in other fishes for that of a whole family. * * * The almost infinite variations of these fishes are dependent on age, sex and sexual development, food and the properties of the water.' In consequence of these variations and peculiarities, many species had been predicated upon coloration alone. Agassiz showed the fallacy of this, for he found that fish in clear, sunny waters, with gravelly bottoms, were highly and brightly colored; while those in shady streams, or where the bottom was dark or muddy, and the water not so clear, were correspondingly dusky in hue; and that bright fish taken from waters of the former character and placed in those of the latter would begin to fade in a few hours, and in a few days or weeks would become entirely changed in hue. He found that the color of brook trout of neighboring streams was influenced by the color and quantity of the water, and that even trout of the same stream differed in color as they frequented the shady or sunny side.

"Now, while most persons are capable of admiring the general result of a long series of observations or experiments, many can not appreciate, or may even be disposed to make light of, some of the seemingly trivial preliminary steps leading to that result. And a person of this character coming upon Agassiz beside a trout stream, studying the changes in coloration of the brook trout—than which there is no lovelier object on God's footstool—might have thought it a sad waste of time, or at least, a subject unworthy the notice of so wise a man."

ROD DIMENSIONS.—Casselton, D. T.—*Editor Forest and Stream:* In reply to the request of "Hollow Rib," in your issue of the 13th, I gladly give the dimensions of my bethabara rod: The butt, of ash, is 18in. in length; butt-cap, ¼in.; then swell for 3½in. in length to a diameter of 1in.; then taper 3½in. to ¾in.; making hand-grasp 7in. in length and 1in. greatest diameter. Reel-seat, 4in.; uniform diameter, ¾in.; straight taper for 4in. to 1 1/16in., then sudden concave taper for the ferrule. Joint, 42in; bethabara tip, 38in.; lancewood tip, 40in. Ferrules—¼in. and 7/32—Nos. 0 and 7 of Chubb's catalogue. Extremity of tip, 3/32in. Total length of rod with bethabara tip, 8ft. 2in.; with lancewood tip, 8ft. 4in. Weight, with either tip, 6¼oz. If "Hollow Rib" intends to make a bethabara rod, he will save time, trouble and temptation to profanity by sending his wood to Thos. H. Chubb (see advertisement in FOREST AND STREAM) and have it turned to suit him. By the way, I am glad to add my mite of commendation to this firm for the fair dealing and prompt attention to orders which has characterized their transactions. I have during the past four years ordered material from them for over a dozen rods, and in every case have received just what I wanted, with but one exception, when I probably did not make my wants clear, but when I called their attention to it the mistake was promptly and cheerfully rectified. In marked contrast was the treatment I received from a celebrated Chicago and New York firm, to whom I sent, some three months ago, for a 1½in. screw, flat-bottom butt cap, inclosing money for same. In reply I received a ⅝in. round-bottom solid cap, which I returned, repeating my previous order. I havn't heard a word from them since then, although I have written them three times, asking them either to send what I want or refund my money. The amount of the latter is so small that I am glad to charge it to profit and loss, as the price paid for the knowledge that I had better have nothing to do with such a house in the future. "Mirofer," as my friend Sandy Graeme says, I would advise "Hollow Rib" to use the "patent anti-friction tie-guides," as they save a world of vexation, caused by the wet line sticking to the rod, as it is sure to do with the ordinary guides. If I can be of the slightest help to him or any other amateur rod makers, I shall be glad to partially pay the debt of gratitude which I owe to those brothers of the gentle craft who have so generously imparted to me their stores of information on many and sundry points.—H. P. UFFORD.

EELS.—*Editor Forest and Stream:* I want reliable information how to catch and dress eels for market with information how to make and use the different wire traps, etc., for tide-water brooks and ponds, and where the most likely places to look for them to spear after they have bedded for the winter. In short, I want to know all about them, their habits, usual time of ascending the brooks to bed, which they are supposed to do here on the island of Grand Manan, but I can find no one that knows anything for certain about them.—PHILIP NEWTON. [There is no book which gives the information required. Beside accidental captures with hook and line, eels are taken in winter by spearing them through holes in the ice, and this requires a local knowledge of their beds, which can only be obtained by examination and trial. In the spring they are taken in eel-pots, which are usually made of elm splints or willow. These are for sale in New York and other cities, and are about three feet long and a foot or more in diameter, with a movable cap at one end and a funnel in the other, like some rat traps. Pots are baited with minnows or fish offal, and anchored and marked by a buoy. In summer eels are speared at night from a boat with a bright light in the bow, which shows them plainly in two to six feet of water. They are also fished for at night with "bobs" made by stringing very large angle worms their entire length on three yards of linen thread until the thread is full, when it is wound round the hand and tied through the middle. The bob is used over the side of a boat, and if in a tideway or current, a sinker is needed. It is kept a few inches from the bottom and when a bite is felt is slowly raised to the surface and the eel quickly thrown into the boat, when it drops off, the only hold being that of the eel's teeth in the thread. Eels move from fresh to salt water in October in the State of New York, some, however, remaining in the mill ponds all winter. A fair size for salt-water eels is from half a pound to two pounds, but they seldom exceed four pounds except in fresh waters, where they grow to six or more pounds. Of their breeding habits but little is known except that they are found to contain eggs in the winter and the young are seen in great numbers in the spring. Our correspondent will have to make himself familiar with their feeding grounds and the localities where they bed.]

BARNEGAT, Aug. 21.—The fishing, all things taken into consideration, is very poor. Occasionally a good string of weakfish is caught, but only in exceptional cases is this so, and then it is all laid to the credit of a "streak of good luck." The menhaden boats on this coast are blamed for the scarcity of fish, and a good many objurgations are indulged in by the people along shore at the mere mention of the menhaden folks. At Beach Haven, it is reported, the fishermen on the beach recently indulged in a little rifle practice, using the crew of the menhaden boat for targets. It resulted in some lively dodging behind masts, smoke-stacks, rigging, etc., by the members of the crew of that particular boat. The latest returns fail to report the number of killed, wounded or missing in this engagement, and the last seen of the craft she was putting out to sea under a full head of steam. This rifle practice is reported as having accomplished one desirable object, in driving the menhaden boats off that coast for a while. The writer counted eleven of the black piratical craft off Harvey Cedars in one day last week, engaged in their calling, and was informed that it was not much of a day for menhaden boats either.—WOODCHUCK.

NEW JERSEY COAST FISHING.—Philadelphia, Aug. 22.—Weakfish are still extremely scarce at Barnegat and Tuckerton bays, and few are being brought in. Small sea bass are, however, plentiful, and sheepshead have been taken throughout the entire season in numbers great enough to amply supply all the hotels on Long Beach, which have been continually crowded with guests. During the past week good squidding for bluefish was enjoyed by sailing parties near both Barnegat and Little Egg Harbor inlets. None upward of one to two pounds were boated.—HOMO.

BLUEFISH IN SOUTH BAY.—Up to last week the fishing has been poor on Great South Bay, Long Island. The schools have lately struck in, and there has been good fishing. Last week one boat took 173 fish, and another took 150, while the lowest catches were from twenty to thirty to each boat. The fish averaged from three to three and a half pounds each, and from twenty to thirty boats have been fishing daily. The best points are Sayville, Bay Shore and Babylon.

NEWPORT BASS.—Newport, Aug. 17.—Bass are unusually plenty. They struck here about two weeks ago, I took twenty last week, weight from 2¾ to 16¼. I should be pleased to answer any inquiries in regard to striped bass fishing in this neighborhood.—W. M. HUGHES (P. O. Box 56).

THOUSAND ISLANDS.—Cape Vincent, N. Y., Aug. 18.—The fishing is first-class at this point now; plenty of bass and pickerel. The sportsmen from down the river and Alexandria Bay are all turning this way.—W. P.

PROTECTIVE CONTRIVANCES FOR EGGS.

[Read before the American Fisheries Society.]

BY PROF. JOHN A. RYDER.

MR. PRESIDENT AND GENTLEMEN: A discussion of the apparatuses by means of which the ova of fishes are protected will, I think, be of interest to the members of this Society. I will roughly classify the eggs of fishes into four divisions, and call one of these groups "buoyant eggs," another "adhesive eggs," another "suspended eggs," and the fourth "transported eggs," the latter class embracing such as are hatched in the mouth or in receptacles especially developed on the outside of the abdomen or under the tail of the parent fish—usually the male; in nests built by the males, or viviparously developed in the ovary or the oviduct of the mother.

The egg of the cod will serve as the type of the first group. It is without an oil-drop, but is buoyant notwithstanding. There is another type of buoyant egg similar to that of the cod, but with an oil-drop opposite the germinal pole, where the embryo develops, consequently the egg is rendered buoyant. That type is represented by the eggs of the Spanish mackerel, of the bonito in the Chesapeake Bay, and of the cusk and a number of other marine fishes.

The second group, which I have called adhesive, is represented very well by the eggs of the goldfish, which adhere singly to plants and weeds. Other species whose eggs are similar to those of the goldfish, are the blennies, which lay eggs in radiating adherent groups. The gobies have a curiously shaped oval egg, almost conical at either end, with tufts at one of their tips. These tufts seem to be made up of small filaments. In other species, too, the eggs are adherent, as is the case with those of the cunning little *Gobiesox*. In other cases the eggs are held together in enormously extended bands or membranes which float, as in the case of the goosefish or fishing frog. Yet other eggs are held together in narrow strips, and adhere together by means of an exterior mucous or sticky envelope, just within which again is a very thick, elastic, perforated membrane, as the eggs of the yelloy perch. This sticky substance glues the round eggs together at their points of contact, leaving spaces between the ova, ouabling the water to pass directly through the openings which are thus left in the bands of eggs. This form of band of adherent eggs is found in the yellow perch, in contrast to which may be cited the white perch, whose eggs adhere by a mucous secretion which seems to glide down on one side to the point where the attachment takes place, and where this mucous substance hardens under water, firmly fixing the egg to the foreign bodies.

The eggs of the slime-eels or hags, which are parasitic upon the cod and on sharks, are also peculiar. These eggs are supplied with a bundle of hooks at each end. I am not sure of the special function of these hooks, but it is probably for suspending the eggs in some way. There are other cases in which adherent eggs are held together in large masses as thick as a man's hand, or they may be spread out over a flat surface. This is the case with the eggs of the catfish; in these, however, we find a contrivance which is peculiarly adapted for protecting the eggs against the violent motions made by the male who aerates, attends and incubates the eggs. In these eggs there is an inner true egg membrane, and an exterior mucous adhesive layer, separated from the inner one by elastic pillars placed at intervals, so that the resulting arrangement is an extremely elastic one, and yields readily to the motions made by the male with his fins. In this case the eggs adhere together in masses very much in the same way as in the eggs of the frogs.

There is yet another singular contrivance which was first described by Professor Jeffries Wyman, of Boston. This is found in a species of the armored catfish of South America. In this case (*Aspredo*) the male fish is provided with a numerous series of little stalks formed on the under surface of the abdomen, and the cup-like extremities of the stalks into which the eggs are received are supplied with capillary vessels, an arrangement being thus developed which constitutes not only a supporting stalk but also a kind of placenta. It is said —although I am not sure that the evidence is very trustworthy —that one species of the gar lays its eggs in strings in a single row, like the common toad. There are other cases in which the ova are uncovered and directly adherent to the abdomen or under side of the tail, as in the case of some of the pipe fishes of Europe. In some of our American species of pipe fishes the eggs adhere beneath the tail in a couple of rows, but are covered by expanded folds of the skin. There are other cases in which the eggs are carried into a pouch formed by the ventral fins. In other species there exists an abdominal or rather caudal pouch which opens just behind the vent of the male, and into which the eggs are received and incubated. In one instance a fish of this class (*Hippocampus*) hatched out under my observation about 150 ova; the drove of embryo sea horses which were finally set free in the aquarium were an interesting study.

Then the number of species which suspend their eggs is quite considerable. The black, leathery case of the common oviparous ray has four filamentous horns, one at each corner, which wind around plants and suspend the eggs to weeds, so that as the tide sweeps by these horns, which have openings in them, fresh water is carried into the case to aerate the embryo and favor its incubation. This peculiar egg case is formed in the end of the oviduct, which is different from the egg membrane

occurring in any of the true bony or Teleost fishes, since it is formed of horizontally interwoven fibres. The egg case of the Cestracion, or Port Jackson sharks, is formed in the same way, but instead of being flat and quadrangular, is twisted into a spiral. I am not positive, however, that the eggs of the Port Jackson sharks are suspended. Another type is found in the *Scombresocidæ*, in which the entire egg membrane is covered with strong filaments which wind round each other and intertwine with the similar filaments of contiguous eggs, which are consequently held together and suspended sometimes in masses several inches in length, such masses being commonly found in great numbers hanging to the meshes of pound nets during July and August. The egg itself measures one-eighth of an inch in diameter. There is another somewhat similar type in which the egg is very much smaller. This is the egg of one of the commonest fishes found in the waters tributary to the Chesapeake Bay, viz., *Menidia*, one of the *Atherinidæ*. They are provided with four filaments attached to one side of the egg, by which they are in like manner suspended and held together in strings. Again, there are still other types in which the ova are hatched in the mouth, as in the case of *Arius*, or marine catfishes. Their eggs are very few in number, but are as large as those of a robin. Some of the smaller blennies take advantage of a dead oyster shell in which to conceal and deposit their adherent eggs.

There are yet other cases in which the male builds a nest. One of the most extraordinary instances of this kind is the common four-spine stickleback (*Apeltes*), which I described four years ago. The male, which is much smaller than the female, has a pouch on the right side of the rectum, from which is poured out a viscid secretion, and which is spun out into threads fitfully by the animal as he goes around a bunch of water weeds like a bobbin to build a little basket-like nest for the eggs. After he has induced the female to oviposit he tends the eggs very faithfully until they hatch. Some investigators go so far as to say that after the eggs are hatched the male stickleback will follow the young ones which leave the nest too young to take care of themselves and put them back in the little cradle in which they were born to thus prevent their being prematurely devoured by other fishes. At one side of the eggs of the stickleback there are minute button-like excrescences. These are also found on the eggs of European species. One of the South American catfishes (*Callichthys*) also builds a nest, but the nature of it I am not familiar with. The male of the paradise-fish ejects from his mouth bubbles of mucilaginous matter, which floats in the form of a cake, and on this the eggs are deposited and hatched out. The *Antennarius* and the fishing frogs of the deeper ocean deposit their eggs on floating masses of sargossa weed.

We are, of course, all aware of the number of forms of salmonoids which prepare beds for the better protection of their eggs. The same may be said also of the black bass, sun perch and lampreys.

I also wish to call your attention to the physical behavior of different species of ova as seen in several groups. This consists of the disposition manifested by certain types of eggs to place the germinal disk in some particular position with reference to the yolk. This disk is directed almost downward in light or buoyant eggs. In the case of the salmon, whose eggs are very heavy, the disk rests on the top of the yolk, and the larger oil drops lie just underneath the germinal disk. In the case of the shad the germinal disk always lies at one side of the yolk, no matter in what position the eggs may be placed. The buoyancy of the oil drops in the salmon's egg keeps the germinal disk directed upward. In the Spanish mackerel its buoyancy keeps the disk directed downward. This peculiarity has some physiological significance, but I do not know what it may be, unless it be for the purpose of the better protection of the egg, so that the embryo may have a better chance to survive.

It was remarked yesterday in Mr. Mather's paper that the eggs of the smelt were remarkably hardy and would stand usage which other ova would not. This calls to my mind the capacity which some eggs have for resisting adverse conditions. There are species which, in order to hatch them out successfully, it is only necessary to change the water once in three or four hours; as, for example, in the case of the stickleback. With the shad this method would not answer. Nor could the ova of salmon be successfully hatched out by such treatment. What I have said on this point shows, I think, that there is a great difference in the power of resistance to adverse conditions manifested by different species of eggs under similar conditions. In the case of the silver gar, for instance, I had at last only three eggs with which to work out the later stages of development, and, although I had them under the microscope fully twenty successive times, each time brushing off the accumulations of filth which would lodge among the filaments covering the egg membrane, yet during all these manipulations the normal development of the embryos remained unimpaired.

I will now call your attention to the viviparous types. The one which I have worked out most fully is the genus *Gambusia*. The parent fishes were from 1⅛ inches to 1¾ inches in length, and are found along the Chesapeake Bay and its smaller southern tributaries. This is a fresh-water, or at least anadromous viviparous species, spawning in July and August. The ovary is lodged in the body cavity, and the vessels pass backward to it, like the subdivided stem in a bunch of grapes to the single berries, each one of the follicles in which the single eggs grow receives a twig from the main vessel and is covered with a network of vessels which branch off from the main twig which enters it, and just at the point where the vessel enters the single follicle, there is a large round opening which answers to the micropyle of the ordinary fish egg laid directly in the water. The egg of *Gambusia* is, however, without a true egg membrane, the thin vascular follicle takes its place. The little fish develops within the follicle, in which fertilization also takes place, the spermatozoa finding their way to the egg through the round pore in the follicle spoken of, the male conveying his milt into the ovary by means of an actual copulation with the female by means of his prolonged anal fin. The development goes on until the fish becomes active and the yolk sac is absorbed. The young fish then ruptures the follicle in which it is imprisoned and slips out through the abdominal pore, perfectly capable of taking care of itself. Not more than twenty or twenty-five individuals are produced at one spawning.

In another type, *Anibleps*, a form described by Professor Jeffries Wyman, the yolk sac itself is covered with villi, and strange to say, continues to grow for some time after the yolk has been absorbed, but the reason for this I am at a loss to understand. It may, however, be that the function of the empty yolk sac is in this case somewhat similar to that of a placenta.

The eggs of the surf perches of the west coast are developed in membranous curtain-like folds of the upper wall of the ovarian sack. These membranes have a longitudinal direction, and after the female is pregnant and the embryos are somewhat advanced in development, they hang down between the embryos, the latter being packed into the ovary somewhat like sardines in a box. The peculiarity about the development of the young in the ovary is that the vertical fins of the fœtuses soon acquire an exaggerated development and have a special set of blood vessels sent to them, the fins also develop marginal prolongations which become highly vascular but afterward atrophy. This arrangement as well as the highly vascular skin of the fœtuses clearly has relation to the respiration of the embryos while in the ovary. Another peculiarity about this type is the enormous development in the embryos of the back part of the intestine beyond anything I have found in any other kind of fish embryos. This hypertrophy of the intestine is of transient character, because this structure afterward gradually diminishes in proportional size and acquires the relative proportion in respect to its diameter found in the adult fishes in which there is no such an exaggerated development of the intestine. The earlier writers, Girard and others, who described these forms, mistook this projecting back part of the intestine for a yolk bag. The fact, however, is, as we know from the figures which are in existence, that this was not a true yolk bag, but merely the intestine developed as I have described it to you with its terminal part thrust down and backward so as to project below the abdominal profile somewhat after the manner of a yolk bag.

FIXTURES.

BENCH SHOWS.

Sept. 22, 23, 24 and 25.—Dog Show of the Milwaukee Exposition Association. John D. Olcott, Superintendent, Milwaukee, Wis.

Sept. 29, 30 and Oct. 1, 2.—Third Annual Dog Show of the Southern Ohio Fair Association. H. Anderson, Secretary, Dayton, O.

Sept. 29, 30 and Oct. 1.—Twelfth Dog Show of the Western Pennsylvania Poultry Society, Pittsburgh, Pa. C. B. Elben, Secretary.

Oct. 6, 7, 8 and 9.—Second Annual Dog Show of the Philadelphia Kennel Club, in conjunction with the Pennsylvania State Agricultural Society. E. Comfort, Secretary, Philadelphia, Pa.

Oct. 6, 7, 8 and 9.—Fourth Annual Dog Show of the Danbury Agricultural Society. S. E. Hawley, Secretary, Danbury, Conn.

Oct. 7, 8 and 9.—Dog Show of the York County Agricultural Society. Entries close Sept. 28. A. C. Krueger, Superintendent, Wrightsville, Pa.

Oct. 13 and 14.—Second Annual Dog Show of the Stafford Agricultural Society. R. S. Hicks, Secretary, Stafford Springs, Conn.

FIELD TRIALS.

Nov. 9.—Second Annual Field Trials of the Fisher's Island Club, for members only. Max Wenzel, Secretary, Hoboken, N. J.

Nov. 9.—First Annual Trials of the Western Field Trials Association, at Abilene, Kan. Entries close Oct. 15. A. A. Whipple, Secretary, Kansas City, Mo.

Nov. 10, 1885.—Seventh Annual Field Trials of the Eastern Field Trials Club, High Point, N. C. Entries for Derby close May 1. W. A. Coster, Secretary, Flatbush, L. I.

Dec. 7.—Seventh Annual Field Trials of the National Field Trials Club, Grand Junction, Tenn. Entries for Derby close April 1. B. M. Stephenson, La Grange, Tenn., Secretary.

A. K. R.—SPECIAL NOTICE.

THE AMERICAN KENNEL REGISTER, for the registration of pedigrees, etc. (with prize lists of all shows and trials), is published every month. Entries close on the 1st. Should be in early. Entry blanks sent on receipt of stamped and addressed envelope. Registration fee (50 cents) must accompany each entry. No entries inserted unless paid in advance. Yearly subscription $1.50. Address "American Kennel Register," P. O. Box 2832, New York. Number of entries already printed **2588.**

THE AMERICAN KENNEL CLUB.

Editor Forest and Stream:

Mr. Osborn is gallantly rushing into danger in his defense of the A. K. C. I have no doubt that he, in common with his many friends, believes that there is no pursuit at which he would not succeed better than the one of trying to make a fool of himself, or being made a fool of by others, but he miscalculates the enormous capacity of the present management of the A. K. C. to make fools of wise men. Solomon himself would fall if he entered and staid too long in those lists. Just look at it. How can an organization be respected or useful under a president who seemingly imagines that he is a legislature and judiciary as well as executive officer? Then, what respect can be left after the official head deliberately debauches the very organic life of the body, as Maj. Taylor did in "construction?"

Then again, Mr. Osborn uses a bad metaphor. This is no case for "fighting." What soldier could fight a chorus of laughter and ridicule? No! No! The first and only thing to be done is to induce our president to step down and out. This is no time to be mealy-mouthed, if we would save the present A. K. C. or keep the path open for another to rise on its ruins. I tell you, "fight" is not the word—"mutiny," "rebellion" or "high treason," call it as you will, is the only thing that will now save the A. K. C. I had a dream once. I dreamed that the Pooppoduck Club advertised that it would give premiums in money to winning exhibitors, and after the show laughed at them and said, "that was only in a Pickwickian sense." Then this variety of "disappointed exhibitor" applied to the A. K. C. for redress. The president gravely lectured the Pooppoducks on their conduct, when behold the chief Pooppoduck put his thumb to his nose, twirled his fingers in the air and whispered "construction." There was a tremendous smash, the sky was illumined with "A.," "K." and "C." in every conceivable combination, and I woke up to wonder why I would eat too much roast pig. W. WADE.

HULTON, Pa., Aug. 21.

THE ENGLISH SETTER STANDARD.

Editor Forest and Stream:

In reply to your invitation for opinion as to the advisibility of altering the present standard of English setters, I will say that sooner or later the present standard will be abolished, as has been illustrated with the advancement of all breeds. It can be likened to the standard of trotting horses of twenty years to those of the present. The former consisted more of the general form, while that of the latter has a tendency to combine the higher element of practical test in speed and form. In other words a sportsman would prefer to purchase an animal, whether horse or an English setter, comprising the combined points, viz.: practical qualities and general form. Were I to purchase a dog, common sense would dictate to give the preference to the practical qualities of a field trial dog combined with the qualities of a bench show dog. I should judge the standard of a dog by his demand and practical use. It is comparatively an easy matter at the present time to obtain a bench show winner, whereas it is apparently an utter impossibility to obtain a dog combining the field trial qualities of a Paul Gladstone with the bench show perfection of a Robert Le Diable. Such being the case, I am of the opinion that the present standard of English setters will not be going in arrears by advancing a few points in favor of the practical qualities of the field trial dog. E. S. HERANCOURT.

CINCINNATI, O., Aug. 15.

Editor Forest and Stream:

The only two breeds of dogs the A. K. C. has any right to settle the standards of are the American foxhound and Chesapeake Bay retriever, two strictly distinctive American ones. Stonehenge is good enough for all the rest; when a better is required it may be relied upon it will be made on the other side. How ridiculous it is to attempt for instance to meddle with the greyhound. And tell me who knows a pure English harrier in this country? He is included for one of the committees to act upon. HOMO.

PEDIGREE OF DAISY.—Newburyport, Mass.—*Editor Forest and Stream:* Can any of your readers give the breeding of the English setter bitch Daisy, owned by the late Barton E. Kingman, of Yonkers, N. Y.?—T. F.

THE IRISH WOLFHOUND.

[From the essay by Capt. C. A. Graham.—Concluded.]

ABOUT the year 1863 the writer took the Irish wolfhound question up, and instituted very searching inquiries after any specimens of the breed. For some years he did not meet with much success; but about twelve years ago three distinct strains were brought to his notice—viz., those of the late Sir J. Power, of Kilfane, the late Mr. Baker, of Ballytobin, and Mr. Mahoney, of Dromore—alas! now all believed to be lost, save some of the descendants of the first two strains, which are in the writer's and one or two other hands. Isolated specimens were also heard of, but none came under the writer's personal notice. It is believed that the Kilfane strain owed their origin partly to dogs bred by Richardson, who not content with writing, actually set to work to discover the breed; from him Sir John Power had more than one specimen. Richardson obtained bitches from Mr. Carter, of Bray (whose strain he mentions in his essay), and crossing these with a grand dog, of great height, produced some remarkably fine dogs. It is also believed that this strain was descended from Hamilton Rowan's dog Bran before mentioned.

Of this strain also were the Ballytobin dogs. Mr. Baker was an enthusiast regarding all old Irish institutions, and having built himself a castle, he did all he could to increase the size of the deer in his park, also to restore to their original form the Irish wolfdogs. To this end he procured the best specimens, wherever to be had, regardless of cost, and at his death, some twelve years ago, he left a kennel of really fine dogs. The pick of these—bequeathed to a friend—a bitch, eventually came into the possession of the writer, and from her and from dogs of the writer's own breeding his present strain has sprung. The strain of Mr. Mahoney was originally procured from Sir John Power, and Mr. Mahoney thus speaks of them:

"The pedigree I had, but I do not think I could now find it. I remember that the grandsire or the great grandsire was one of the last old Irish dogs which I have an idea belonged to the famous Hamilton Rowan; but of this I am not certain. As wolves disappeared in Ireland the dogs gradually fell away also. They were expensive to keep, and from the fifteenth century the diet of the people gradually changed from being almost exclusively animal to being purely vegetable. Thus there was no food to preserve the size and power of the dogs. The race of red deer also became extinct, except in the mountains of Kerry, where a few wandered; but under the care of Lord Kenmare and Mr. Herbert, and their successors, have developed into noble breeds without a cross. Thus there was no inducement to extenuate the old powerful dog into the swifter but sparer deerhound, and the few specimens that remained preserved the original characteristics; while in Scotland the cause that preserved the race from extinction tended to change its qualities and older heroic proportions into the modern deerhound.

"My idea was that by selection, avoiding in-breeding, and proper feeding the old characteristics might in some generations be somewhat recovered. The colors were dark brindle, bluish-gray and fawn. The bitch was usually lower, and therefore looked stouter than the dog; indeed, she was so in proportion. Distemper was my great difficulty; but the wider cross got over this much better than the close breed, as might be expected. They were stouter than deerhounds. They are affectionate dogs rather than intelligent; but I had one which was more remarkable for character than any dog I ever saw. He had a kind of moral force among other dogs that made them yield to him without fighting, though stronger in appearance. He cared for nobody but me, though others fed him more frequently, and his attachment was very extraordinary. His hair would bristle over his back toward the head when he was angry, and he would walk quietly up to his enemy's face, whether dog or man, with a determination that neither could face."

Two of these dogs were given to a lady who resided in the Isle of Wight. The writer has their photographs. The dog is stouter and wider in head than any deerhound; but they have a strong look of that dog. Mr. Baker's breed would appear to have been larger dogs than either of the other strains. The bitch that came to the writer stood twenty-eight inches, and some of the dogs were said to stand thirty-one and thirty-two inches, very powerful animals and thoroughly rough.

Lord Derby, grandfather of the present lord, bred Irish wolfhounds of evidently much the same character as the strains just alluded to. One of them is thus described by a gentleman who often saw her, and to whom was given one of her puppies by a deerhound dog: "She was a dark brindle brown, the coat of long wiry hair, the build heavier and head more massive than that of the deerhound, the hair on the head thicker and lying flatter than that of the deerhound, ears rather larger than those of a deerhound, though lying close to the head." This dog was bred about thirty years ago.

From her some very large dogs were bred by a deerhound; some of the descendants were nearly black. A very fine female of this breed was owned by a Mr. Lascelles many years ago. A gentleman who often saw her said to the writer: "You have quite converted me respecting the Irish wolfhound being a rough-coated dog. The one I mentioned to you, which belonging to Mr. Lascelles, had—and which he always said was one of the last of the pure breed—certainly come quite up to your description. She was very large for a female, and of very noble appearance. She always lived in the drawing-room, and was always rather dangerous to strangers. Mr. Lascelles never would breed from her, as he could not meet with a male worthy of such a mate."

A dog was bred from the Ballytobin bitch above alluded to before she came into the possession of the writer, by a son of a dog Major Garnier bred, which was given to a clergyman residing near Knowsley. It was seen by the present Lord Derby, who, while stating it was very like the dogs formerly kept at Knowsley, also considered it was a finer and larger dog than any they had. The sire was a blue and tan in color, and some of the puppies in the same litter as this dog were black and tan when born, turning out eventually blue-gray and tan. The dog in question was a reddish brindle. He is said to have stood thirty-two inches high.

The writer has not only studied the subject carefully, but has bred extensively, with more or less success, though death and disease have hitherto robbed him of the finest specimens. Dogs have been bred approaching his idea closely in looks, though wanting the required height and power; also dogs of very great height, etc., which were somewhat wanting in character. Yet the very certain knowledge has been gained from these efforts that it is perfectly possible to breed the correct type of dog in the course of a few years—bar losses from death and disease. It has been the steadfast endeavor of the writer to get crosses from such dogs of acknowledged Irish wolfhound blood as were to be found, in preference to simply crossing opposite breeds to effect the desired object.

Several very fine dogs have been bred by the writer, but he has lost all the finest. He succeeded in rearing a remarkable dog that stood thirty-three inches, and was covered with a thick coat of nearly black shaggy hair. This dog most unfortunately died at seventeen months of age, leaving behind him one litter of puppies, of which few remain.

The Irish Kennel Club was courageous enough to establish a class for the breed of Irish wolfhounds at their show, April, 1879, and it is strenuously to be hoped that this step in the right direction will be followed on the part of other shows.

At this show several dogs of much wolfhound character were shown, the prizes going to a son of the thirty-three-inch blackish dog above mentioned, a cross-bred Dane and deerhound dog.

Whether the prizes were rightly or wrongly awarded it is not proposed to consider. The first prize dog, Brian by name, a very fine rough gray dog, the last male of his litter, is, alas! dead.

Scot was from a Kilfane sire out of a fine red bitch. He i

a powerful dog of strong red color, deficient in coat, notably on head, and loses much in appearance thereby. Taken on the whole, however, he gives a very fair idea of the breed as to form and bulk; but instead of standing only 29½ inches, as he does, he should be at least 33 inches, and be enlarged in proportion. The blood can be traced back for forty years. His dimensions are: Height, 29½ inches; girth of chest, 33½ inches; length of head, 12 inches; girth of head, 18¼ inches; forearm, 8¼ inches; weight, 110 pounds, which will serve to show what the general conformation of the dog is.

The writer has also a very grand bitch, sister to Brian, of most excellent form and great power. She is gray brindle in color, very deep in chest and big in bone, standing 28½ inches, girthing 34 inches, and weighing 110 pounds. Her speed is marvelous, and activity extraordinary.

A very sensible letter was not very long ago published in the *Live Stock Journal* by a German gentleman, from which the following extracts will prove of interest: "That the Irish wolfhound is a pure 'windhund' [greyhound] I believe as little as that it is a pure Dane. As opposed to the wolf the largest 'windhund' is not strong enough, and the Dane, on account of its short fine hair, is too vulnerable. I think the Irish wolfhound is the Scotch deerhound, with some blood from our modern large German dogge [boarhound?] to give him the necessary strength.

"According to old paintings, rough coats (for the boar dogs) were preferred, because they were less liable to injury than the smooth."

The writer has just had painted, under his close superintendence and guidance, a portrait of an Irish wolfhound of 35 inches, life size, of a gray color, and it presents to the vision a most striking and remarkable animal of a very majestic and beautiful appearance, far, far beyond any dog the writer has ever seen in grandeur of looks.

I shall conclude with an authentic statement of how the last wolves existing in the county of Tyrone were destroyed by means of the Irish greyhound. This account is taken from the biography of a Tyrone family published in Belfast in 1829:

"In the mountainous parts of the county Tyrone the inhabitants suffered much from the wolves, and gave from the public fund as much for the head of one of these animals as they would give for the capture of a notorious robber on the highway. There lived in those days an adventurer who, alone and unassisted, made it his occupation to destroy these ravagers. The time for attacking them was in the night, and midnight was the best time for doing so, as that was their wonted time for leaving their lair in search of food, when the country was at rest and all was still; then, issuing forth, they fell on their defenseless prey, and the carnage commenced. There was a species of dog for the purpose of hunting them, called the wolfdog. This animal represented a rough, stout, half-bred greyhound, but was much stronger.

"In the county Tyrone there was then a large space of ground inclosed by a high stone wall, having a gap at each of the two opposite extremities, and in this were secured the flocks of the surrounding farmers. Still, secure though this fold was deemed, it was entered by the wolves and its inmates slaughtered. The neighboring proprietors having heard of the noted wolf hunter above mentioned, by name Rory Carragh, sent for him, and offered the usual reward, with some addition, if he would undertake to destroy the two remaining wolves that had committed such devastation.

"Carragh undertaking the task, took with him two wolfdogs and a little boy only twelve years old, the only person who would accompany him, and repaired at the approach of midnight to the fold in question. 'Now,' said Carragh to the boy, 'as the two wolves usually enter the opposite extremities of the sheepfold at the same time, I must leave you and one of the dogs to guard this one while I go to the other. He steals with all the caution of a cat, nor will you hear him, but the dog will, and positively will give him the first fall; if, therefore, you are not active when he is down to rivet his neck to the ground with this spear, he will rise up and kill both you and the dog; so good night.' 'I'll do what I can,' said the little boy as he took the spear from the wolf-hunter's hand.

"The boy immediately threw open the gate of the fold and took his seat in the inner part, close to the entrance, his faithful companion crouching at his side, and seemingly perfectly aware of the dangerous business he was engaged in. The night was very dark and cold, and the poor little boy, being benumbed by the chilly air, was beginning to fall into a kind of sleep, when at that instant the dog, with a roar, leaped across him and laid his mortal enemy upon the earth. The boy was roused into double activity by the voice of his companion, and drove the spear through the wolf's neck as he had been directed, at which time Carragh appeared bearing the head of the other."

In concluding this article, the writer would express his astonishment that so noble and pre-eminently attractive a breed of dog should have found so few supporters. Of all dogs the monarch and most majestic—shall he be allowed to drop from our supine grasp?

Irishmen!—Englishmen!—all ye who love the canine race—let it not be so.

Since this article was written—in the *Live Stock Journal* of 20th August, 1880, "A Practical Farmer," writing on some other subject, thus concludes his letter: "Now I am on the subject canine, I will relate an incident that occurred to me in 1840, or within a year of that date. Staying with some friends in a southern county, I was taken to see an old Irish wolfhound belonging to a gentleman of means, he was then said to be the last of his breed in England; was old, perfectly white and much after the style of a Scotch deerhound, but larger and considerably more powerfully built, and he had the deepest toned and most melancholy bark I ever heard." Let readers note how exactly this description coincides with that put forward by me!

In the same number of the *Live Stock Journal* there is mention of a paper contributed to the "Zoologist" by Ernest Friedel, entitled "A German View of the Fauna of Ireland." Some extracts are given regarding the Irish deerhound (*sic*), but they are of small interest and mostly contained in this article; allusion is made to Lord Altamont's dogs, and a foot note is appended by the editor of "Zoologist" to this effect, "It is now generally admitted that the dog described by Lambert here referred to was not an Irish wolfhound at all, but a Great Dane!"

We are told in the *Sportsman's Cabinet*, published in 1803, p. 26, that Buffon asserts that from the common greyhound and the Irish greyhound the mongrel greyhound was produced, also called the greyhound with the wolf's hair, showing very plainly that the Irish dog was, in his opinion, a rough dog, as the ordinary greyhound of that period was in all probability a smooth dog.

In the *World* newspaper, late in 1880, it was asserted that Mr. Parnell, M. P., has in his house some banners, carried by the regiment of militia commanded by one of his immediate ancestors that was "out" in 1798, on which is depicted the Irish wolfhound. The writer took the trouble to make inquiries from Mr. Parnell personally, and found that the fact was true, and that the dog depicted was similar to a Scotch deerhound, but much larger and more massive (apparently), and very rough.

Mr. Ronayne Conron, of Lewisham, saw a brace of Irish wolfhounds about 1847, fierce looking, piercing eyes, shaggy brows and rough dark gray coats, yet so kind a child could play with them. He opines they were of either the Kilfane or Ballytobin breed. Barclay tells us that in 1563, at a deer drive given by the Earl of Athol for the amusement of Queen Mary, 360 deer and 5 wolves were slain in one day.

In the month of June, 1882, was erected at Ennis, a statue to the memory of Allan, Larkin, and O'Brien, who were executed at Manchester, 1867. This beautiful statue was executed by Messrs. O'Niell, of Dublin. It represents Erin with one hand resting on the Irish harp, while the other grasps the Celtic cross, while crouching at her feet is the Irish wolfdog. Unfortunately the figure of the dog—owing to the sculptor's requirements—has been very much reduced in size, and the extreme grandeur and nobility of the animal thereby lost. The dog, now in the Zoological Gardens at Dublin, was taken as a guide (unknown to the breeder) for the animal represented, thereby proving that the sculptor and the writer of this article (who bred the dog in question) are agreed as to the type of Ireland's ancient hound. It is stated that at one time the English government offered an equal reward for the head of an Irish Catholic priest and a wolfdog.

1884.—The following description of a descendant (immediate) of Hamilton Rowan's Irish bloodhounds—not of his Irish wolfdog, for he owned one of the latter as well as some of the former—has been given to the writer by a gentleman to whom the dog, as a puppy, was given by H. Rowan:

"Nero. Color, gray, almost mouse color; head, of decidedly bloodhound type, long, rather narrow, peaked; deep flews, large hound ears, eyes small; coat similar to a mastiff's or smooth St. Bernard; double dew claws on hind legs. To a side view rather a long low dog, than square built; gentle temper on the whole, and affectionate, but never forgot an enemy, and ever afterward began to bark when he came to the door—before he knocked! Delighted in water, and would fetch and carry anything."

There seems no doubt whatever that the dogs were crossed bloodhound and Great Dane, and have not the faintest resemblance to the Irish wolfdog.

On Nov. 30, 1883, a Doctor Mac'Cormack, of Belfast, wrote as follows to the author of this essay:

"When I was a child we had one of those magnificent creatures (the Irish wolfhound) and I have been told that Doctor Weir, of Dromore, County Down, had two, and possibly has them still (?) in all probability of Mr. Mahoney's breed. Very early in life I remember going to Lough Lall (?), County Armagh, near which was the seat of the Cope family. They had a wolfdog, and the bay of the animal impressed me almost as much as the lion's roar. Archibald Hamilton Rowan, an Irish patriot and a most magnificent man, used to go about attended by a wolfdog. He has, however, long gone to the majority and his dog along with him.

"The old Irish could not have lived without the wolfhound; he was their protector and friend."

On Aug. 31, 1884, an impression was sent to the writer of an old seal, by a gentleman residing in Clonmel. It was the property of an old gentleman to whom it had been given, when young, by another old gentleman, a friend, in whose family it had been for generations. It is believed no traditions attach to the seal, and the breed of dog depicted was not known to the owner of the seal, but there is little, in fact, no doubt in the mind of the writer that the animal shown is the old Irish wolfhound! In every respect, including the rough coat, it corresponds with the writer's firm conviction of what the dog was—save and except the tail which hangs too much and is too bushy.

It is opined from the spelling and style of the motto—"Gentle when strok'd," "Fierce when provoked"—that the seal was engraved about the commencement of the 18th century, at which period wolves were existing in "England" as well as in Ireland? as was certainly the case to a much later date.

In corroboration of the writer's assumption that the dog represented was an Irish wolfhound, the reader is referred to page 15, where it will be seen that the motto corresponds exactly with that placed under the "arms" of the ancient monarchs of Ireland, which had Irish wolfhounds as supporters.

In "Fores'" window (the great print seller of Picadilly) was exhibited in June, 1883, an oil painting by James Ward, R. A., of a wolfhound, evidently done from the life. It represented a very powerful dog, red in color, hard, rough coat, ears cut off at the ends. It was probably painted at the early part of the present century. The form was that of a very strong deerhound, but considerably thicker.

The picture is signed, but not dated—it was formerly the property of Sir E. Landseer, at the sale of whose drawings Messrs. Fores purchased it—the drawing probably would be about the beginning of this century, as Ward was born 1770.

About 1860 a fine dog of this breed was owned by a gentleman living in Wales. He has been described by the owner's son to the writer as follows: About 31 inches high, very powerful, far beyond any deerhound; head much more massive, pale fawn color, muzzle somewhat black, strong rough coat, head well covered, ears somewhat larger and more pendulous than a deerhound's, probable weight about 120 pounds, was supposed to have been of the strain of the Lords O'Neill, which, however, is open to doubt.

The *Modern Geographer*, published by Thomas Meyers in 1882, has this passage in it: "The Irish greyhound is much celebrated for its size and vigor, and is the most majestic as well as the most beautiful of the canine species. It, however, is very rare at the present day. A species of woldog has also been deemed peculiar to the country. In size it exceeds the mastiff, but its shape has more resemblance to that of the greyhound."

Mr. Watson, of Ballydarton, Bagnalstown, in Ireland, a well-known master of hounds, has informed the writer that hounds for the pursuit of the wolf were kept there in the time of his grandfather, and that the last wolf was killed at Myshall, close to Ballydarton, 1786 or 1787. The hounds were described as coarse powerful animals, running by scent. About the year 1848, an Irish wolfdog was purchased from a gentleman named Carter, who lived at Laughinstown, near Bray, in Ireland, by Mr. W. Leigh Clare. He was stated to have stood over 32 inches, like a deerhound, but stouter and more powerful, very up-standing, blue-gray brindle in color. Afterward a bitch was also procured, light fawn color, stoutly built, but not so rough in hair as the dog. She died while pupping and the dog soon after came to grief. Mr. Clare saw many wolfhounds in this gentleman's kennels; also he kept Irish terriers, and was celebrated for both breeds. Mr. Clare states his dog was a grand specimen.

During the visit of a lady named O'Brien to America, in the autumn of 1882, she had pointed out to her in the museum at Minneapolis, Minnesota, a stuffed specimen labeled as an Irish wolfhound. It was rough, pure white in color and of good size.

The fact that the Irish wolfdog was a rough dog (which some people seem to doubt), has been handed down from generation to generation in Ireland, and all breeders have invariably and firmly adhered to this characteristic.

Quite lately a club has been formed for the purpose of recovering fully this grand race of dogs. There is every reason to hope that success will attend their efforts if steadily and carefully persevered in. A great deal of interest has been excited, both in England and Ireland, of late regarding the breed, and if good specimens are forthcoming within the next few years, no doubt it will again take its place as "king of dogs." The writer of this essay is at present acting as Hon. Sec. of the club and will be most pleased to render any assistance or information to intending breeders of Irish wolfhounds.

IDA LEWIS AND HER DOG.—Ida Lewis, the Newport harbor heroine, has had for a dozen years a faithful companion on her little rocky island, a big black Newfoundland dog, which recently died, causing her great grief. "I remember well, long ago," says one of her acquaintances, "her putting her arms around the big affectionate fellow and saying, 'Men have not been good to me, and I love dogs better.' Her matrimonial adventure was most disastrous, and this dog was her only protector."

DEATH OF TAM O'SHANTER.—This well-known Laverack setter died on Aug. 1 at the age of nine years and three months. He was bred by Mr. Daintry Hollins, and was got by champion Rock out of Rum. Mr. G. Lowe bought him as a whelp, and he has always remained in the same ownership, although very large sums have been offered for him. Many good judges who have seen him at different times are of opinion that in certain points Tam o' Shanter was the best-looking setter ever bred. His head and the set on of his ears were simply perfection, and faultless again were his back, loins and bent stifles. He was not straight in front, and for this reason his owner never showed him, although he has been blamed for not doing so, his idea being that so good a dog should have no chance to be beaten by a worse opponent than himself, through one very palpable fault, which was really caused by accidental circumstances. Tam o' Shanter was a natural worker, and never happier than when ranging a field in his own methodical way, his nose being extraordinary, though he was slow, and his education never completed by a breaker. As a stud dog no setter has surpassed him, his stock having a world-wide reputation for their field merits and beauty, not only in this country but in America, Germany, France, and even in Australia and South Africa. Sir Alister, Wild Rose, Tycoon, Robbie Burns, Tam the Chapman, Dirk Hatteraick, Discord, and Tam of Braunfels may be about the best known winners by him, but a column of a newspaper might be filled with the names of good ones by him, and his descendants now in a second and third generation are almost legion. Like the Laveracks generally, Tam o' Shanter was a dog of fine character, full of intelligence, and his affectionate nature endeared him to his owner and home in a way to stall off any sort of price for him, a very fair figure being tendered only a few weeks ago by one who was well aware that the old dog was very decrepit, merely, as he put it, for the honor of owning Tam o' Shanter. It had been long decreed, however, that old Tam should live out his life among his friends, and have his grave in his owner's garden.—*Kennel Gazette.*

AN EXCITING COON HUNT.—The first coon hunt of the season, which proved to be a very exciting one, took place near The Highland, Thursday evening. The party started from the hotel about 9 o'clock, accompanied by Frank Stevenson, Mr. English, F. De Peyster and several others. W. E. Wilcox led the way to the cornfield. The dogs were let loose, and in about thirty minutes his coonship was treed. One of the party ascended the tree; a circle was formed, and orders were given to shake. The corn stealer soon fell among the dogs, when an exciting struggle commenced, the coon, dogs, and some twenty men all rolling down the ledge together. At this point in the melee an amusing incident occurred which added much to the merriment of the occasion. A youth who accompanied the party, and who is noted for his precocity, and who evidently had not hunted coons before, attempted to show those dogs how to kill a coon, but was reminded by the dogs and coon that they wished for no interference in their little family quarrels, and so gave the young man a severe bite in the leg, and also badly lacerated his hand as well as his feelings. The coon, which proved to be one of the first settlers, when hung upon the scales brought them down at nearly twenty pounds. The hunters started for home about 11 o'clock, feeling that they had fun enough for one night.—W. E. W.

SHOW DISTEMPER.—Gen. Wayne, Pa.—*Editor Forest and Stream:* In the last issue of the *American Kennel Register* Dr. J. R. Housel, in his communication relative to the death of two of his dogs from distemper contracted at the recent Philadelphia show, lays blame to the veterinarian for allowing Glench Elcho (improperly registered at Philadelphia show as Glen Elcho) to remain, after his owner had requested permission to remove him. If you will permit I would like to reply to this through your columns (as well as the *A. K. R.*) so that the coming Philadelphia show may not suffer from exhibitors being scared away by this communication. I wish to say, as the owner of the dog, that he had no signs of any sickness whatever during the show nor has he had any since, neither did I remove him from the show or have any desire to do so. He had distemper during the fall of 1884, and was perfectly well and traveling around in all kinds of weather by Jan. 1, 1885.—J. M. FRONEFIELD, JR.

GREAT DANE CLASSES.—Pittsburgh, Pa., Aug. 19.—*Editor Forest and Stream:* Will you please mention the fact in your Kennel department that there are many owners and breeders of the Great Dane who are barred from exhibiting in the American dog shows because this valuable breed is relegated to the miscellaneous class, and takes it chances with the "rag tag and bobtail" of the bench. The Great Dane, although only lately introduced into this country, has taken firm hold among the many who can appreciate a powerful and noble animal. As he is now the chief fancy among the English and the coming dog in America, I beg that you will note the fact that we have in New York, Philadelphia and Pittsburgh many excellent specimens of the dog. In the Pittsburgh bench show of next month let us have a Great Dane class, and I venture to say it will be well filled.—E. P. H.

THE MIRO CASE.—Philadelphia, Pa., Aug. 21.—*Editor Forest and Stream:* I have received notice that the appeal of J. A. Nickerson from the decision of the Philadelphia Kennel Club in reference to Miro has been referred by Major Taylor to the Committee on Discipline, which is composed of Messrs. Morgan, Pope, Shattuc, myself and Mr. Munhall, who is now ineligible, as the club which he represents has not paid the assessment made at Boston. I have already, in the executive committee of our club, passed upon this case, and as the issue is between Mr. N. and our club, in justice to Mr. N. we should not be allowed a voice in the decision on his appeal. For this reason I am desirous that I be excused from acting. I would also suggest that Mr. Pope, who is a member of the same club as Mr. N., withdraw, leaving the matter with Messrs. Morgan and Shattuc for decision.—WM. H. CHILD.

PHILADELPHIA FALL DOG SHOW.—The entries of foxhound packs at this show will be large, and a big effort is being made to have all the hunt clubs represented. Already many inquiries are being made at the club rooms by fanciers, and a large turnout of local dogs is expected. The judges' slate is not yet completed, but soon will be, and premium list will be mailed in a few days.—HOMO.

JUDGES AT PITTSBURGH.—Pittsburgh, Pa., Aug. 21.—*Editor Forest and Stream:* Messrs. Chas. H. Mason and James Watson have been appointed judges of all non-sporting classes at our coming dog show. These gentlemen will divide the classes between them as they think best. Judges of sporting classes will be announced later.—C. B. ELBEN, Secretary.

DOG LOST.—A black setter dog with white stripes down his breast, and forefeet tipped with white, was lost July 11. He is ten months old, of medium size, with long, narrow head. A resonable reward will be paid for his return. Address MacNamara Bros., 145 Canal street, Providenee, R. I.

WESTERN FIELD TRIALS.—Kansas City, Mo., Aug. 25.—*Editor Forest and Stream:* Col. W. E. Hughes, Dallas, Tex.; D. C. Bergundthal, Indianapolis, and E. C. Sterling, St. Louis, have been selected to judge at the Western trials this fall.—A. A. WHIPPLE, Secretary.

PEDIGREE OF GIPSEY.—Washingtonville, O.—*Editor Forest and Stream:* Can any of your readers give the pedigree of the English setter bitch owned by Charles De muth?—B.

THE WAVERLY DOG SHOW.—We understand that the proposed dog show of the New Jersey Kennel and Field Trials Club at Waverly, N. J., will not be held.

KENNEL NOTES.

NOTICE TO CORRESPONDENTS.

Kennel notes are inserted in this column free of charge. To insure publication of notes, correspondents MUST GIVE the following particulars of *each animal:*

1. Color.
2. Breed.
3. Sex.
4. Age, or
5. Date of birth, of breeding or of death.
6. Name and residence of owner buyer or seller.
7. Sire, with his sire and dam.
8. Owner of sire.
9. Dam, with her sire and dam.
10. Owner of dam.

All names must be *plainly* written. Communication on one side of paper only, and signed with writer's name.

NAMES CLAIMED.

☞ *See instructions at head of this column.*

Belle of Brym Mawr. By F. C. Sayles, Jr., Pawtucket, R. I., for English setter bitch, whelped Dec. 2, 1884, by Tempest (Pontiac—Fairy II.) out of Lilly (Carlowitz—Princess Nellie).

General Grant and Cute. By L. Gardner, Mount Vernon, N. Y., for lemon and white pointer dog and white bitch, whelped July 1, 1885, by Duke Royal (A.K.R. 2472) out of Gala Day.

Mack. By Wm. E. Leffingwell, Athens, Pa., for liver and white cocker spaniel dog, whelped July 28, 1884, by Sam (Romey—Jessie) out of E. A. Higgins's Fannie.

Bounce, Jr. By Wm. B. Saxton, Cohocton, N. Y., for liver and white cocker spaniel dog, whelped July 4, 1885, by Bounce (Romey—Jessie) out of E. A. Higgin's Fannie.

Punch. By George W. Fish, Waverly, N. Y., for liver and white cocker spaniel dog, whelped July 4, 1885, by Bounce (Romey—Jessie) out of F. A. Higgins's Fannie.

Rupert, Romulus, Remus, Ruthven, Rosaline, Ruth, Ran and Rhea. By Riverview Kennels, Clinton, Mass., for mastiffs, four dogs and four bitches, age not given, by Agrippa. (A.K.R. 449) out of Rena (A.K.R. 262).

Hattie, Jenny and Gypsy. By Jas. E. Hair, Bridgeport, Conn., for fawn Italian greyhound bitches, whelped June 20, 1885, by A. B. Norcross's Fido out of owner's Posey.

BRED.

☞ *See instructions at head of this column.*

Katydid—Foreman. Dr. J. W. Hayward's (Franklin, Mass.) English setter bitch Katydid (A.K.R. 1173) to Blackstone Kennels' champion Foreman, Aug. 16.

Beryl—Verone. Mill Brook Kennels' (Bergenfields, N. J.) imported St. Bernard bitch Beryl (champion Bayard—Richmond Brenda) to their champion Verone (A.K.R. 27), July 28.

Surrey Fatch—Flippant. Surrey Kennels' (Ellicott City, Md.) fox-terrier bitch Surrey Patch (A.K.R. 1706) to their Flippant (A.K.R. 528), Aug. 3.

Jill—Flippant. Surrey Kennels' (Ellicott City, Md.) fox-terrier bitch Jill (A.K.R. 329) to their Flippant (A.K.R. 528), Aug. 11.

Judy II.—Brier. J. E. Ruse's fox-terrier bitch Judy II. to E. L. Bailey's Brier (A.K.R. 1898), Aug. 3.

Judy—Brier. John O. Blinn's fox-terrier bitch Judy to E. L. Bailey's Brier (A.K.R. 1898), Aug. 12.

Curley—Jumbo. E. L. Bailey's (Pittsfield, Mass.) Skye terrier bitch Curley (A.K.R. 1907) to Wm. Fish's Jumbo, Aug. 1.

Fan—Rags. John Cole's bull-terrier bitch Fan to E. L. Bailey's Rags (A.K.R. 2587).

Brundy—Rags. E. L. Bailey's (Pittsfield, Mass.) bull-terrier bitch Brundy to his Rags (A.K.R. 2587), Aug. 2.

Surrey Clover—Flippant. Surrey Kennels' (Ellicott City, Md.) fox-terrier bitch Surrey Clover (A.K.R. 1869) to their Flippant (A.K.R. 528), Aug. 18.

Queen Anna—Dashing Lion. G. W. Ballantine's (Washingtonville, O.) English setter bitch Queen Anna (Zanzibar—Lady Elgin) to his Dashing Lion (Dash II.—Leda), July 31.

Delle—Boss Gladstone. G. W. Ballantine's (Washingtonville, O.) English setter bitch Delle (Druid—Dodge's Rose) to Boss Gladstone (Gladstone—Lavalette), Aug. 11.

Pet—Little Duke. W. E. Deane's (Somerset, Mass.) beagle bitch Pet (A.K.R. 2521) to A. H. Wakefield & Co.'s Little Duke (A.K.R. 1994), Aug. 18.

Chase—Little Duke. A. H. Wakefield & Co.'s (Providence, R. I.) beagle bitch Chase (Ringwood—Winnie) to their Little Duke (A.K.R. 1994).

Althea—Obo II. Herbert Flint's (Haverhill, Mass.) cocker spaniel bitch Althea (A.K.R. 842) to champion Obo II. (A.K.R. 432), June 29.

Hazel Kirke—Young Obo. Herbert Flint's (Haverhill, Mass.) cocker spaniel bitch Hazel Kirke to Young Obo (A.K.R. 861), June 30.

Nellie II.—Foreman. Blackstone Kennels' (South Attleboro, Mass.) English setter bitch Nellie II. (Count Noble—Rosalind) to their champion Foreman, July 4.

Dorcas—Arlington. Mr. Barber's (Central Falls, R. I.) red Irish setter bitch Dorcas (Glencho—Syren II.) to Blackstone Kennels' Arlington (Dan—Ruby), July 11.

Orphan Girl—Foreman. E. R. Troxell's (Pittston, Pa.) English setter bitch Orphan Girl (Leicester—Peeress) to Blackstone Kennels' champion Foreman, July 25.

Pet Berwyn—Plantagenet. Blackstone Kennels' (South Attleboro, Mass.) English setter bitch Pet Berwyn (Dashing Berwyn—May Druid) to their champion Plantagenet, Aug. 6.

Queen Vic—Flash. Geo. D. McDougall's (Bridgeport, Conn.) Gordon setter bitch Queen Vic (Tom—Jessie) to Blackstone Kennels' champion Flash (A.K.R. 958), Aug. 14.

Daisy—Dick. Chas. P. Ferguson's (Spring Vale, Me.) beagle bitch Daisy to his Dick, July 2.

ERIE—TAMMANY.—*Editor Forest and Stream:* Bang Grace served Mr. Rivers's bitch Erie. Mr. Geo. D. Macdougall, who saw one service, can testify to the fact. I am willing to submit the matter for judgment to the A. K. C.—LUKE WHITE (Bridgeport, Conn., Aug. 22).

Editor Forest and Stream: I wish to say that I saw Bang Grace serve Mr. Rivers's bitch Erie, as Mr. White states.—GEO. D. MACDOUGALL (Bridgeport, Conn., Aug. 22).

WHELPS.

☞ *See instructions at head of this column.*

Flora II. S. H. Hewlett's (Webster Groves, Mo.) collie bitch Flora II. (A.K.R. 2581), July 27, five (two dogs), by J. A. Long's Rob Roy (A.K.R. 334).

Kitty Mac. Houghton Farm's (Mountainville, N. Y.) collie bitch Kitty Mac (A.K.R. 539), July 30, ten (six dogs), by champion Rex (A.K.R. 149); one bitch since dead.

Ayrshire Flossie. Houghton Farm's (Mountainville, N. Y.) collie bitch Ayrshire Flossie (A.K.R. 1414), May 17, eight (four dogs), by B. Holmes, Jr.'s, Gaffa II. (A.K.R. 2323); two bitches since dead.

Nell. Al Ward's bull-terrier bitch Nell, May 20, nine (four dogs), by E. L. Bailey's Rags (A.K.R. 2587).

Jill. J. Jagueth's fox-terrier bitch Jill, July 12, six (three dogs), by E. L. Bailey's Brier (A.K.R. 1898).

Trouble. Geo. Jordan's (Montreal, Can.) bull-terrier bitch Trouble, Aug. 9, six (four days), by Royal Bull-Terrier Kennels' The Earl (Marquis—Lady).

Dashing Belle. E. W. Jester's (St. George's, Del.) English setter bitch Dashing Belle (A.K.R. 814), Aug. 16, eight (five dogs), by his Glen Rock (A.K.R. 1616).

Leah II. S. B. Foard's (Elkton, Md.) English setter bitch Leah II. (Royal Duke—Leah), July 18, nine (four dogs), by E. W. Jester's Glen Rock (A.K.R. 1616).

Molly Bawn. Isaac Yearsley's (Coatesville, Pa.) English setter bitch Molly Bawn (Lincoln—Kirby), July 8, five, by E. W. Jester's Glen Rock (A.K.R. 1616).

Linda. Thos. Blyth's (Peale, Pa.) English setter bitch Linda (Dashing Monarch—Peggy), Aug. 2, two (one dog), by E. W. Jester's Glen Rock (A.K.R. 1616).

Spot. Dr. M. F. Young's (Littleton, N. H.) beagle bitch Spot (Hector—Shoo Fly), July —, four (one dog), by H. F. Schellhass's Trailer (A.K.R. 2525).

Katie. Chas. More's (Pawtucket, R. I.) setter bitch Katie (Arlington —St. Cecilia), July 12, eight, by Blackstone Kennels' champion Plantagenet.

Jessie. Blackstone Kennels' (South Attleboro, Mass.) English setter bitch Jessie (Blue Dan—Flake), July 25, eight (four dogs), by their champion Plantagenet.

Grace B Blackstone Kennels' (South Attleboro, Mass.) English setter bitch Grace B. (London—Dawn), Aug. 7, six (two dogs), by their champion Foreman.

Donna. Chas. E. Taylor's (Bath, Me.) English setter bitch Donna (A.K.R. 499), Aug. 15, ten (five dogs), by Gus Bondhu (Dashing Bondhu —Novel).

Creole. James S. Wibert's (Mauch Chunk, Pa.) red Irish setter bitch Creole, Aug. 6, nine (six dogs), by I. H. Roberts's Bruce (A.K.R. 54).

Bertha. Mill Brook Kennels' (Bergenfields, N. J.) St. Bernard bitch Bertha, Aug. 17, thirteen (six dogs), by their imported Zeno (Harold—Judy); two dogs since dead.

Red Biddy. Geo. Laick's (Tarrytown, N. Y.) red Irish setter bitch Red Biddy (A.K.R. 1558), July 8, eleven (seven dogs), by champion Glencho; all since dead.

Cornelia. L. Shuster's (Philadelphia, Pa.) English setter bitch Cornelia (Leicester—Dart), Aug. 16, eleven (two dogs), by champion Gladstone; two bitches since dead.

Gypsey Queen. C. W. Willard's (Westerly, R. I.) beagle bitch Gypsey Queen (Briar—Bush), Aug. 24, five (three dogs), by A. H. Wakefield & Co.'s Little Duke (A.K.R. 1994).

SALES.

☞ *See instructions at head of this column.*

Dorothy. Black cocker spaniel bitch, whelped June 28, 1885 (Obo II. —Miss Nance), by S. R. Hemingway, New Haven, Conn., to E. E. Hall, Jr., same place.

Barney. Black cocker spaniel dog, whelped July 2, 1885 (Obo II.—Yolande), by W. H. Tuck, Wilkesbarre, Pa., to Sheppard Ayers, same place.

Den. Sable and black collie dog (A.K.R. 2530), by Houghton Farm, Mountainville, N. Y., to S. Tappen, Troy, N. Y.

Haut Boy. Black and sable collie dog (A.K.R. 2532), by Houghton Farm, Mountainville, N. Y., to C. R. Clark, Granby, Mass.

Kitty May. Black, sable and white collie bitch (A.K.R. 2536), by Houghton Farm, Mountainville, N. Y., to D. R. Hartley, East Bethlehem, Pa.

Rex Rob Roy. Black, sable and white collie dog (A.K.R. 2537), by Houghton Farm, Mountainville, N. Y., to M. A. Scott, Richmond, Va.

Snip Kit. Black, sable and white collie bitch (A.K.R. 2539), by Houghton Farm, Mountainville, N. Y., to L. A. Estabrook, West Lebanon, N. H.

Topsy R. Black, sable and white collie bitch (A.K.R. 2540), by Houghton Farm, Mountainville, N. Y., to A. R. Andrews, Charles River Village, Mass.

Countess II. Mastiff bitch (A.K.R. 1500), by F. P. Basset, New York, to H. C. Merritt, Tuckahoe, N. Y.

Gypsy. Fawn, with white points, greyhound bitch, whelped June 20, 1885 (Fido—Posey), by Jas. E. Hair, Bridgeport, Conn., to H. M. Wilmot, same place.

Jennie. Fawn greyhound bitch, whelped June 20, 1885 (Fido—Posey), by Jas. E. Hair, Bridgeport, Conn., to H. C. Burdick, Springfield, Mass.

Princess. Mastiff bitch, whelped June 7, 1885 (Ilford Cromwell—Brenda II.), by Pine Hill Kennels, Melrose, Mass., to F. C. Pierce, Concord, Mass.

Edna. Mastiff bitch, whelped June 7, 1885 (Ilford Cromwell—Brenda II.), by Pine Hill Kennels, Melrose, Mass , to Wm. P. Hood, Somerset, Mass.

Joe. Black, white and tan beagle dog, whelped June 20, 1884 (Ringwood—Gypsy Queen), by C. F. Kent, Monticello, N. Y., to H. D. Eggers, Louisville, Ky.

Lente. Black, white and tan beagle bitch, whelped May 23, 1882 (Ringwood—Norah), by C. F. Kent, Monticello, N. Y., to H. D. Eggers, Louisville, Ky.

Belle II. Black, white and tan beagle bitch, whelped Oct. 23 (King —Belle), by C. F. Kent, Monticello, N. Y., to R. H. Meacham, New Haven, Conn.

Gypsy Queen. Black, white and tan beagle bitch, whelped Sept. 20, 1882 (Briar—Bush), by C. F. Kent, Monticello, N. Y., to C. W. Willard, Westerly, R. I.

Bannerman—Gypsy Queen whelp. Black, white and tan beagle bitch, whelped Feb. 20, 1885, by C. F. Kent, Monticello, N. Y., to C. E. Hobart, North Abington, Mass.

Pompey. Black cocker spaniel dog, whelped April 27, 1884 (Obo II. —Gem), by Fred B. Stafford, Faneuil, Mass., to Geo. L. V. Tyler, West Newton, Mass., and resold by him to C. G. Browning, Worcester, Mass.

PRESENTATIONS.

☞ *See instructions at head of this column.*

Bonnybel. Liver and white pointer bitch (A.K.R. 1770), by Surrey Kennels, Ellicott City, Md., to Dr. J. W. Downey, New Market, Md.

Punch. Liver and white cocker spaniel dog, whelped July 4, 1885 (Bounce—Fannie), by E. A. Higgins, Cohocton, N. Y., to George W. Fish, Waverly, N. Y.

IMPORTATIONS.

☞ *See instructions at head of this column.*

Little Nell. Bull terrier bitch, under 25 pounds, 2½yrs. old (Victor —Daisy), by T. R. Varick, Manchester, N. H., from F. Hinks, Birmingham, Eng.

Conqueror. Blue and tan Yorkshire terrier dog, whelped April 25, 1880 (Bismark—Elmar), by Mrs. J. K. Emmet, New York, from Mrs. M. A. Troughear, Bury, Eng. Price, £250.

Rifle and Trap Shooting.

Address all communications to the Forest and Stream Publishing Co.

THE "FOREST AND STREAM" RIFLE TRIAL.

Editor Forest and Stream:

As suggestions are in order in reference to the forthcoming rifle tests you are to conduct at Creedmoor, I have these to offer. As your tests are to be of hunting rifles and not of artillery, I would suggest that the weight be limited to 10 pounds except in bores above .50-cal. Also that three tests of 10 shots each be made for accuracy.

First—Rifles to be carefully cleaned after each shot.

Second—Rifles to be blown into after each shot a given amount.

Third—In which as little time and as little circulation of air as possible be allowed between shots.

I predict that should you subject rifles to this test you will find a very marked difference in accuracy of all rifles shooting under these varied conditions, also that some rifles will stand this test much better than others.

I am very glad to see that you have taken up this subject which must prove of general interest to riflemen, as it is one of which a majority know but little. F. J. RABBETH.

Editor Forest and Stream:

It would appear to a man up a tree that the very first question that you will be called upon to decide will be, what constitutes a hunting rifle? It would also appear that some of your most valued correspondents who have fully grasped your proposition are of the impression that anything in the shape of a rifle has a place in your coming trial. How it would appear to me that any rifle which for any reason cannot be comfortably carried by an able-bodied man on a day or week's tramp in the woods has no place in this controversy. Of what interest to a hunter on the track of a deer is the trajectory of a rifle that weighs 40 pounds, 20 pounds or even 15 pounds that he has left at home. What cares he for a rifle that can't be shot more than five times without cleaning.

Some rules you will have to adopt, and our friend E. A. Leopold has suggested those of the National Rifle Association. This would be treading too rudely on the sacred relics of the past, but if a firm cannot make an accurate shooting rifle that weighs less than 10 pounds they should not advertise hunting rifles, and as far as weight is concerned they are not much out of the way. You cannot please every one, and I don't know but the best way for you to do is not to try and please any one but yourself, and you will be likely to suit the largest number of American riflemen. I.

AKRON, O.

Editor Forest and Stream:

Please accept my sincere thanks for the proposed trial of hunting rifles. As you invite suggestions, would be pleased to offer the following: Have been using the rifle for more than thirty years on squirrel, deer and wild turkey, using, until the past five years, the old-style muzzleloader of from .32 to .50-caliber. The past five years, after various tests of different calibers, weights and proportions of powder and lead, settled on a .40-caliber, seventy grains of powder and 265 grains paper-patched bullet in one of the latest make of Remington-Hepburn rifles.

As Major Merrill suggests, make the outside "limit to 200yds.," and the inside to 25yds. Please use the paper-patched bullet versus the naked bullet; test the merits of each, as many claim the patched bullet to be more accurate than the naked, and similar claims are made for the naked bullet. Please give the test with the lightest pull of trigger as against the regulation pull, as the double or set trigger is the most used by those who desire the greatest accuracy in shooting for a precise point on game—the head of a squirrel and wild turkey, or the eye of a deer, for instance.

ELLSWORTH, ILL. DANIEL ARROWSMITH.

Editor Forest and Stream:

Referring to the "kind comments" of Maj. Merrill in your issue of Aug. 20, I beg leave to call attention to the fact that Mr. Merrill says in the beginning that he will not "avail of criticism," and closes by saying that he offers his article less "to criticise than instruct," thus virtually saying that his article is a criticism. His style of closing his article is significant. If he had not alleged that his article was instructive, perhaps no one would have discovered it. His article consists of fourteen paragraphs. For convenience I will number them from 1 to 14. No. 1 conflicts with No. 14 as shown above. No. 2, I regard the test as a comparative test. If but one make of rifles was to be tested it would be a different matter. In this connection I wish also to notice the communication of Mr. G. J. Romer. He speaks of competitions in which prizes are to be won, and says that in such cases arbitrary rules are all very well, as they are intended to give all contestants an equal chance to win. In this case there is no prize offered, but it cannot be denied that the manufacturers whose rifles make the best record will reap a substantial benefit resulting from increased sales. After the tests are made each particular rifle will take its rank, not so much from its actual record as a separate and distinct performance, but from its standing as compared with other rifles which were tested at the same time under similar conditions. These are some of the reasons which induced me to propose a set of rules which I consider the best of any rifle association rules of which I have any knowledge. If no rules are to be observed I shall not worry over the matter. No. 3. Here is probably the place where the alleged instrucion comes in. I shall speak of this further on. Nos. 4 and 5. Entirely irrelevant. Sights and trigger pull have something to do with accuracy, not trajectory, as every rifleman knows. Nos. 6, 7 and 8. If Mr. Merrill thinks that paper-patched bullets are suitable for hunting, I withdraw my proposition and hope that FOREST AND STREAM will accept such ammunition if offered. No. 9. A quotation from my former article. No. 10. He regrets that a certain point had been touched upon. No. 11. He thinks the matter had best now be dropped. Agreed. No. 12. "Twenty shots in thirty minutes is too rapid firing." This is a matter of opinion. I have seen men using a muzzleloading rifle average fifty shots per hour and keep it up ten hours per day for several days in hot weather, during the month of July, the object being to score the most din. bullseyes in a week's shooting, off-hand, at 200yds. No doubt Mr. Merrill has seen shooting similar to this. Of course, such rapid firing seldom occurs in hunting. Yet it does occasionally happen, as we may find out by perusing hunting sketches in FOREST AND STREAM. And it is not only the pot-hunters that do the rapid firing, although they have the reputation of being addicted to it. The test I proposed was only a moderately severe one. Hunters want a rifle that can be used all day without wiping, and still give accurate shooting, if such a weapon can be obtained, without sacrificing any other good quality. The test I proposed would be a long step in the direction of a solution of this problem. Mr. Merrill continues, "It heats the barrels," etc. So it does, and for this reason it would make the test more severe, and enhance the value of the records obtained. If the heating of the barrel from rapid firing will change the trajectory, it is important that that fact be known, and also to what extent such changes of temperature of the rifle barrel will operate. This becomes all the more important if paper-patched bullets are used. It is the opinion of some riflemen of large experience that the patched bullets referred to will not give good results in rapid firing. If but twelve shots per hour are fired, as proposed by Mr. Merrill, this valuable information will not be gained. No. 13. He says, "I fully believe the editor of FOREST AND STREAM and his experienced experimenter know just what to do and how to do it." Then why did Mr. Merrill offer his suggestions in response to the general invitation of the editor? "I leave them to stand on their own bottom," (this is very kind), "for it is their right to do so." (Undoubtedly). "They embark in their own craft" (a cutter, I hope), "and I believe they know full well how to sail it" (if they do not they are willing to learn), "and I heartily wish you success in your voyage." So say we all. Now for paragraph No. 3. He says, "A springing rifle is next to worthless at best." It has been established on good authority that all rifle barrels over twenty inches in length do spring or buckle to a considerable extent at the moment of discharge when fired off-hand, or from an ordinary rest, such as a hunter might use in making a long and difficult shot. Mr. W. E. Metford, of England, explained this matter very fully in the *Spirit of the Times* about the year 1878. It was also touched upon by Mr. F. J. Rabbeth, in FOREST AND STREAM about a year ago. The exact date I cannot give, as I have been unable to find the paper containing the article. The rifle Mr. Rabbeth used was a heavy one, about ten pounds weight, with a very small bore, .28-cal., I think. A very small cartridge was used, and on varying the powder charge the springing of the barrel was quite apparent. When Mr. Merrill makes such an apparently heterodox statement, he should endeavor to accompany it with some sort of proof. In regard to the machine rest proposed by him, I will suggest that if it holds the rifles as firmly as he intimates, it will cause them to make a flatter trajectory than they would if fired from the shoulder as recommended by your correspondent "I." This advantage will operate in favor of the lighter rifle, a result which it is not desired to attain. Another point and I am done. Mr. Merrill says, "the light ones cannot well spring or 'buckle' as they call it, and if any one shall do so, it will justly call out its own doom." This may be "new," but is certainly not "instructive," inasmuch as the springing or buckling of the barrel has nothing to do with the trajectory. His peculiar theory on this point reminds me of the boy who bent his gun barrel across his knee, fired around the haystack and killed the rabbit. LIEUT. E. A. LEOPOLD.

NORRISTOWN, Pa.

RANGE AND GALLERY.

THOMASTON, Conn., Aug. 15.—At Bridgemoor range to-day the subjoined scores were made. Massachusetts ring target:

W H Dunbar	12	12	12	11	9	11	12	10	9	9—107
E Thomas	10	12	11	9	12	11	9	9	11	11—105

After a lapse of four and a half years Massachusetts will be represented at the fall meeting at Creedmoor by a picked team of twelve men, selected from the best rifle shots in the Massachusetts volunteer militia. Some forty candidates will probably present themselves for competition, and from this number the best fifteen will be selected, twelve as the regular team and three as substitutes.

RIFLE STOLEN.—Stolen from Napoleon Merrill, of Waukesha, Wis., on June 13 last, a muzzleloader target and turkey rifle, weighing 14 pounds, made by "J. C. Wells, Milwaukee, Wis.," and stamped in full view on the 30-inch barrel, .38-caliber, "cast steel barrel"; stamped in full view also, "Remington" on the under side near the breech-set lock, small iron patch box, plain varnished stock, open and aperture and step fixed sights, a new nipple and hammer showing no wear. It is believed a tramp going westerly from Waukesha stole it, took it apart, and carried it off concealed by his coat as a kind of pack. A bullet mould will have to be made for it for long ranges. It is a very close shooter for 500yds. I wish the members of all western rifle clubs, gunsmiths and others, to have a sharp look out for this rifle, and if recovered a suitable reward will be given to the finder or informant by Napoleon Merrill. Brother sportsmen, stop this thief and housebreaker, and seize this rifle if you can.—MAJ. H. W. MERRILL, 126 East Sixtieth street, New York city.

THE TRAP.

Correspondents who favor us with club scores are particularly requested to write on one side of the paper only.

FIELD DAY AT VICKSBURG.

Editor Forest and Stream:

This has been a gala day for Vicksburg. There have been a great number of visitors in the city and the citizens turned out in large numbers. The attractions were, first, a company drill for the State championship and a purse of $2,000 and gate money between the West Point Rifles, of West Point, and the Volunteer Southrons, of this place; second, a tilting tournament; and, third, a team shoot at glass balls and clay-pigeons.

The drill was judged by three competent officers from the U. S. Army and resulted in a victory for the West Point Rifles, with a score of 83.33 against 77.33 for our company. The programme for the drill was made by the judging officers and handed to the captains of the companies just before going into the field. Some of the maneuvers were difficult and admirably executed.

Immediately after the company drill a drill was had to determine the best drilled man. This resulted also in a victory for the West Point Rifles, several of the Rifles remaining in line after the Southrons had been motioned out. This was also judged by the army officers.

As the tilting tournament is something new probably to most of your readers, I will briefly describe it. Three posts about 10ft. high, 15yds. to 20yds. apart, placed in line or otherwise, have each a horizontal arm about 4ft. long at the top. From the extremity of each arm depends a wire 2ft. or more long, at the lower end of which is a clamp also generally made of wire. Into each clamp is placed a ring 2in. diameter, with the open part at right angles to the line of posts, and so delicately held that the slightest touch releases it. The lance consists generally of light wood, is about 8ft. long, round, 2in. diameter at the larger end, and tapering to a point at the other end, where it is tipped with metal. This lance is held by the rider near the balancing point in his right hand, the rear end extending on the under part of the arm from the hand to the elbow. With this lance the rider sweeps by the posts at full speed, taking the rings as best he can. Each rider is called a Knight of so and so, with a dress appropriate to his name. The South is noted for her graceful and skillful riders, and the "tilting tournament" requires not only that, but an accurate eye and a steady nerve as well, aided by practice more or less thorough.

Sometimes the tournament affords considerable amusement in addition to the interest by observing the skill of the contestants. On this occasion the steed of W. H. Tillman, Knight of the Plains, at one time became obstinate, and instead of sweeping by the posts on the beaten track, indulged in some gymnastic exercise not down on the programme, converting his back into an elastic springboard, his tail into a whipcracker, and his body into knots of various complications. Evidently he comprehended the title of "Knight of the Plains," and entered into the spirit of, if, indeed, he was not one in fact.

The prizes consisted of $100 to first, $50 to second, and $25 to third.

The total distance to be ridden was 100yds., time not to exceed ten seconds, each knight to have three rides, having a possible of nine rings. The time actually made was from five seconds for the quickest trip, to nine for the longest.

Ten knights entered the contest. The first prize was won by H. L. Foote, Knight of the Gun Club; second by J. H. Robertson, Knight of the Red Bone Club; third, by J. J. Irwin, Knight of Omega. The rings taken were 8, 7 and 6, respectively. The following ladies were crowned Queen of Love and Beauty by the winning knights: Miss Georgia Waddill by Foote, Miss Lizzie Wright by Robertson, Miss Bazinsky by Irwin, and Miss Maggie Burnett, of Port Gibson, Miss., by John Parkinson, Knight of Claiborne Light Guards, who won fourth honor.

The team shoot originally was to have been for a purse of $150 to winning team, but as no regular team was entered, except the Vicksburg Gun Club, $100 offered by this club was withdrawn. Two other teams were organized on the ground, the Natchez and Omega. The shooting done was considerably below the average, owing mainly to the unfavorable grounds shot on. The dark background of the Vicksburg hills rendered the clay-pigeons especially very indistinct. Pigeons were thrown from three traps, set in the fourth notch, and balls from a single Mole's rotating trap. The following is the score:

Vicksburg.

	Pigeons.	Balls.
Bookout	1001110111	1111111111—17
Tillman	0101101111	0111111101—15
Hebron	1111111111	1101111111—19

J J Irwin	0100110010	1011000111—10
Goff	1101110001	1111100001—12—54

During the entire day there were order, harmony and the best of spirits. During the drill the West Point Rifles, as well as the Volunteer Southrons, were cheered lustily by the crowd. W. L. P.

VICKSBURG, Miss., Aug. 17.

GEORGIA TOURNAMENT.

The National Gun Association, Cincinnati, O.:

In behalf of the members of the Association who participated in the Third Inter-State Tournament just closed here, we desire to express our thanks, and at the same time to impress upon all sportsmen one prominent advantage of its membership, viz.: The facility and freedom from expense with which local tournaments can be organized under the auspices of the National Association. Heretofore there has been a lack of local tournaments on account of the preliminary expense attending the same, and the fact that the local sportsmen hesitated to assume the financial responsibility for the same. Now this is changed. The National Gun Association in case any of the members wish to organize a tournament, advance to them the cash required for preliminary outlay, and guarantee its members who manage the tournament against all financial loss. Traps, targets and all necessaries are shipped from the home office, and any information or suggestions always kindly given by its officers and members wherever located.

This was well illustrated in the case of the tournament of Aug. 10, 11 and 12, held at Macon, Ga., under the auspices of the Association. By unavoidable circumstances the other four members of the executive committee, who had the management of this tournament, were unable to attend, and the writer, although alone, had no difficulty in completing all the preliminaries and drawing together a large number of sportsmen from different States, who enjoyed the sport, and which resulted in forming many ties of friendship between the participants, and creating a strong desire to have all brother sportsmen join the Association in order that such a meeting may become more general.

The Cincinnati officer of the Association supplied us with all requisites in abundance, and seemed determined that we should want for nothing.

The sportsmen in attendance were a jolly set of fellows, and we kept up the firing from 10 A. M. until dark each day, not even stopping for dinner, but lunching on the grounds. The visitors were much impressed with the location and arrangement of the grounds, and will return on the occasion of the Georgia State fair tournament, beginning Oct. 26 next, under the auspices of the National Association, at which time we hope to see more of your Eastern and Western members. Very respectfully, MATT R. FREEMAN.

MACON, Ga., Aug. 17.

POUGHKEEPSIE, Aug. 20.—Second competition for the gold medal presented by the Wappinger's Falls and Poughkeepsie gun clubs; medal to be won twice to become the property of the winner. It was won first by E. Decker, of Poughkeepsie, with a score of 15 out of 20. The terms of the match are: 10 single rotary glass balls, Card trap, 18yds. and 5 pairs doubles 15yds. The contest to-day resulted in a victory for Max Condit, one of the best clay-pigeon shots in Dutchess county. We were favored with beautiful weather, everything working smoothly, combined to make a very pleasant shoot:

M Condit	8	3—17	J A Kunkel	6	7—13
Dr W R Case	8	8—16	H Meyers	5	8—13
G M Godinez	7	9—16	G A Talmage	6	6—12
Anderson	7	9—16	Dr. Wm Baxter	5	6—11
C Clapp	8	8—16	H Crozier	4	6—10
E Decker	8	7—15	T C Wakeman	3	6— 9
W T Seary	7	7—14	T Crozier	2	w.— 2

Five clay-pigeons, 18yds., fourth notch: Max Condit 4, J. M. Godinez 3, Anderson 3, E. Decker 3, Dr. W. R. Case 2, H. Meyers 2, G. A. Talmage 2, W. T. Seary 2, J. Kunkel 1, C. Clapp 1, H. Crozier 0, Dr. Wm. Baxtero. We have now quite a flourishing little club and would be pleased to arrange a team match of two, three, five, eight or ten men on a side with any club along the river between New York and Albany, either at single and double glass balls or single clay-pigeons. —A. C. GALLUP.

MOBILE, Aug. 16.—Mobile Gun Club match at 7 single leather-wing bats, 21yds. rise, class shooting:

Vass	1111111—7	McDonnell	1011011—5
Boltz	1111101—6	Custa	0110111—5
Sartore	1111110—6	Burch	1111100—4
Drey	1101111—6	Nicholas	1100000—2
Dumont	0111111—6		

W. T. Vass first, Boltz and Sartore divided second, McDonnell and Custa divided third.

Second match, team and class shoot combined, 10 single leather-wing bats, 21yds., and 5 pair doubles, 18yds.:

Team No. 1, J. H. Stewart, Captain.

Stewart	1110110111	11	11	11	00 11—16
Boltz	1111110111	11	01	11	10 11—17
C Sartore	1111111101	11	11	11	11 10—19
Dumont	1111111111	10	00	00	11 00—13
Wagoner	0111101111	01	10	11	11 11—16
J Sartore	1111111001	11	01	11	11 10—16
J Burch	1100100110	10	00	11	00 10— 9—106

Team No. 2, J. Custa, Captain.

Custa	0111100111	10	11	11	01 11—15
McDonnell	1101111111	10	00	10	00 11—13
Drey	1011111110	01	11	10	10 11—15
C Burch	1111001111	10	01	10	11 11—15
Nicholas	0000110011	10	10	10	11 10—10
Vass	1111110001	11	11	11	11 11—17
Crabtree	0111011010	10	11	10	11 01—13— 98

C. A. Sartore first, Vass and Boltz divided second, and Stewart and Wagner divided third.

Third match, 6 single American clay-birds, 18yds., 3 different angles, class shooting:

Wagner	111111—6	McDonnell	011110—4
Custa	101111—5	Vass	011011—4
C Burch	111101—5	Boltz	011101—4
Antone	111101—5	Drey	011001—3
Dumont	011101—4	Nicholas	000011—2
Stewart	001111—4	J Burch	000110—2
Sartore	010111—4		

T. Wagner first, Custa and Burch divided second, and Vass won third on two scores of 3 birds each.

Fourth match, 5 single leather wing bats, 21yds., class shooting:

Custa	11111—5	Sartore	11110—4
Vass	11111—5	Dumont	11001—3
Boltz	11110—4	Wagner	01101—3
Burch	10111—4	McDonnell	11100—3

Custa and Vass divided first, Sartore and Burch divided second and Wagner won third.

WORCESTER, Aug. 21.—There was a large attendance at the second and final day of the tournament at the grounds of the Worcester Sportsmen's Club to-day. The following were first prize winners in the different events:

Seven clay-pigeons, 27 entries—M. O. Whittier.
Seven pigeons, 23 entries—A. R. Bowdish and H. W. Eager.
Seven pigeons, 24 entries—Joseph Beaudry, H. W. Eager and E. T. Smith.
Eight pigeons, 28 entries—W. L. Davis and W. J. Bradley.
Six pigeons, 28 entries—W. J. Bradley.
Five pigeons, 28 entries—W. Parker and W. J. Bradley.
Seven pigeons, 27 entries—H. W. Webber and M. D. Gilman.
Five pigeons, 29 entries—O. R. Dickey, H. W. Webber and A. F. Cooper.
Six pigeons, 27 entries—Joseph Beaudry and G. G. Tidsbury.
Five pigeons, 27 entries—E. W. Buffington, H. W. Eager and H. W. Webber.
Seven pigeons, 24 entries—G. G. Tidsbury and W. J. Bradley.
Five pigeons, 28 entries—G. G. Tidsbury and W. J. Bradley.
Five pigeons, 28 entries—H. W. Eager and A. Parker.
Five pair pigeons, 16 entries—O. R. Dickey and E. T. Smith.
Five pigeons, 20 entries—H. W. Eager and A. F. Cooper.
Five pigeons, 16 entries—Joseph Beaudry.
Five pigeons, 14 entries—H. W. Webber.
Five pigeons, 14 entries—Joseph Beaudry and H. W. Webber.
Five pigeons, 13 entries—H. W. Webber and O. R. Dickey.
Five pigeons, 13 entries—H. W. Webber and A. F. Cooper.
Five pigeons, 11 entries—H. W. Eager and M. O. Whittier.
Freeze out, 11 entries—R. Graham.

The last 9 events were extra purses. The $100 offered by the club in cash prizes of $10 each, for the best scores made in the regular events of the two days' tournament, were divided in accordance with the following score:

	Broken.	Lost.		Broken.	Lost.
1. H. W. Eager	107	10	6 E. T. Smith	96	21
2. H. W. Webber	105	12	7. Joseph Beaudry	93	24
3. W. J. Bradley	101	16	8. A. F. Cooper	92	25
4. W. L. Davis	93	18	9. A. Houghton	91	23
5. E. W. Buffington	98	19	10. T. S. Hall	90	27

NEW HAMBURG, Ontario, Aug. 17.—Aug. 14 another trap-shooting walking match by members of the Hamburg Gun Club took place, at clay pigeons, screened trap, distance 25 to 12yds.:

T Puddicombe	1110111101011111—12
A F Spring	1111100101111101—11
S G Holley	1011101101011111—11
F Bourne	1111011101011111—12
E Sauers	1010110101111011—10
J Clancy	1010010110010110— 8

Puddicombe and Bourne tie. 1¼-ounce shot allowed. A. F. Spring has only the use of his left arm, and makes remarkably clean breaks. Holley in this match and in the former used 1 ounce of No. 6. The regular match for the silver cups, first and second prizes, took place Monday, Aug. 10, at clay-pigeons, 18yds. rise, first notch, screened Ligowsky trap:

T Puddicombe	1111101111—9	F Bourne	1111011011—8
A F Spring	1010110101—6	E Sauers	0101000111—5
S G Holley	1111110111—9		

The tie was decided at next regular match to-day, same conditions:

T Puddicombe	1111111111—10	F Bourne	1101111011— 8
A F Spring	1011111101— 8	C Sauers	1101100111— 7
S G Holley	1111101111— 9	J Clancy	0101100100— 4

The first cup scores: Holley won, 8, Puddicombe 4, Bourne 1, Spring 1. The second cup goes to second man.—SANCHO.

FRANKLIN, Pa., Aug. 22.—Franklin Gun Club, National Gun Association rules, first badge shoot at 15 clay-pigeons:

Sibley	111111010000111—10	Brashear	1011110010	w
Cunningham	1111111101111—14	Fenletter	1011101111	w
May	1101110111	w	Lamberton	011111111110	w
Bowser	1001091011	w	Hineman	1010011011	w
Vincent	1011111011	w			

Cunningham won badge.

Match at 3 five birds, ties on clays, trap 3, 27yds. rise:

	Birds.	Clays.		Birds.	Clays.
Sibley	011—2	0111—3—5	Brashear	011—2	0111—3—5
Cunningham	011—2	010 —1—3	Finletter	111—3	
May	011—2	00 —0—2	Lamberton	111—3	
Bowser	011—2	0110—2—4	Hineman	011—2	010 —1—3

Lamberton and Finletter divided first, Sibley and Brashear divided second.

Match at 2 pairs double clays: Sibley, Bowser, Vincent, Brashear, 1; Cunningham 3, May 1, Baker 0. Ties of 1: Bowser 2, Vincent, Brashear 1, Sibley 0.—QUIRT.

BOSTON GUN CLUB.—There was a large attendance of shotgun men at the grounds of the Boston Gun Club on the 22d, and some spirited contests took place. Prof. Snow made a clean score of three straight sevens, a total of 21, while Ward and Mitchell tied on 21, Warren, Spencer and Philbrick running a close race for third place. The sport was made interesting by the fine style in which the birds took flight. 1. Seven birds, 18yds. one trap—Lander first. 2. Seven singles—Ward and Mitchell first. 3. Seven singles—Mitchell first. 4. Seven birds—J. Philbrick and H. C. Warren first. 5. Seven single birds—Ward first. 6. Seven birds—Ward, Warren, Philbrick and Lander first. 7. Seven singles—Ward and Warren first. 8. Seven birds—Ward and Lander first. 9. Three pair doubles—Ward and Lander first. 10. Seven birds—Mitchell first. 11. Seven singles—Warren and Philbrick first. 12. Seven birds—Snow first. 13. Seven singles—Ward first. 14. Seven birds—Philbrick and Ward first. 15. Seven singles—Snow and Ward first. 16. Seven birds—Snow first.

MT. KISCO GUN CLUB, Aug. 21.—15 clay-birds, 18yds. rise:

J Wood	000000000000000— 0	Petton	000000010000101— 3
E Bailey	000001010000010— 3	Barnard	011000110000000— 5
Warner	001101110101110— 9	Finch	010011101001001— 7
J Reed	001010000010010— 4	Burr	011010000001000— 4
E Carpenter	001010110000000— 4	A Reed	110000101001100— 6
H Bailey	011011110010000— 7	Hart	000000100000001— 2
A Sarles	100101101111101—10		

WHITE MOUNTAIN SPORTSMAN'S CLUB.—Littleton, N. H., Aug. 18.—Barrett and Whittaker handicapped six feet, 18yds. rise, clay-pigeons, Ligowsky screened trap, four flights:

Collins	111111111111111—15	Coburn	010110100000001— 5
Parker	010011110100100— 7	Whittaker	110101001001100— 7
Amsden	110101100001011— 9	Bellows	111011100100911— 9
Lane	100110000101010— 6	Ide	111101101001000— 9
Barrett	101110010101011— 9—46	Young	010010110101011— 8—33

SPORTSMEN'S ASSOCIATION OF THE NORTHWEST.—The first meeting and shooting tournament was held at Seattle, W. T., last Friday, Saturday and Sunday.

TROY VS. HOOSICK FALLS.—Teams of 10 men picked from each club, 15 balls each. The scores out of a possible 150 were as follows:

Troy Club	S. Goggins	15,	J. Titcomb 13, N. Lewis 12, G. Buesser 14,
A. Paul	14, W. Dommer	13,	J. Richardson 14, J. Sickles 12, J. Hancock
13, C. Pluckrose	15; total	135.	Hoosick Falls Club—P. Kearney 11, C.
Palmer	8, J. Hilton	9,	H. Gross 13, L. Allen 10, W. Rich 7, B. Vandecar
9, G. Stemp	12, L. A.	Austin	11, S. Sipperly 12; total 102.

MOBILE, Aug. 16.—There was a well contested series of matches at Cass' Garden to-day at bats and clays. The scores ran: First match—7 single leather wing bats, 21yds. rise, class shooting. Vass 7, Boltz 6, Sartore 6, Drey 6, Dumont 6, McDonnell 5, Custa 5, Burch 4, Nicholas 2. Vass wins first money, Boltz and Sartore second, McDonnell and Custa third.

Second match, team and class shoot combined—10 single leather wing bats, 21yds. rise and 5 pairs of doubles, 18yds. Team No. 1, J. H. Stewart Captain: Stewart 16, Boltz 17, C. Sartore 19, Dumont 13, Wagner 16, J. Sartore 16, J. Burch 9; total 106. Team No. 2, J. Custa Captain. Custa 15, McDonnell 13, Drey 15, C. Burch 15, Nicholas 10, Vass 17, Crabtree 13; total 98. Sartore wins first money, Boltz and Vass second, Stewart and Wagner third.

Third match was shot at 6 single American clay birds, 18yds. rise: Wagner 6, Custa 5, C. Burch 5, Antone 5, Dumont 4, Stewart 4, Sartore 4, McDonnell 4, Vass 4, Boltz 4, Drey 3, Nicholas 2, J. Burch 2. Wagner wins first money, Custa and Burch second, and third was won by Vass on two scores of 3 birds each.

MALDEN GUN CLUB.—There was a good attendance at the grounds of the Malden Gun Club at Wellington on the afternoon of the 22d weekly shoot. Following is the result of the several sweeps: 1. 5 clay-pigeons, Francis, Pond and Sanborn divided first. 2. 5 clay-pigeons, Snow first. 3. 5 blackbirds, Sanborn and Swift divided first. 4. 5 clay-pigeons, Stanton and Perry divided first. 6. 5 blackbirds, Francis, Sanborn and Perry divided first. 6. 3 pairs clay-pigeons, Francis first. 7. 5 blackbirds, Swift and Loring divided first 8. 5 blackbirds, Wardwell first. 9. 10 clay-pigeons, Perry first. 10. 5 clay pigeons, Warren, Goodwin and Sanborn divided first. The ninth event was the medal match. Perry won the first with 9, Swift the second with 8, and Buffum the third with 7.

EMERALD GUN CLUB.—Regular shoot, Aug. 17, Long Island City, Schwatenberg's Park. Messrs. Codey, Sidling, Measel, Butz, Godfrey, Lynch, Glaccum and Schermerhorn 25yds., Granger and Hudson 30yds., the rest 21yds.: Counsellor Cody 6, J. Sidling 6, J. Measel 9, P. Butz 7, J. Godfrey 8, B. Lynch 5, J. Glaccum 6, L. Schermerhorn 9, D. M. Granger 10, Dr. Hudson 6, M. Cherry 4, M. McMunn 8, H. Rubino 5, R. Regan 4, S. McMahon 6, J. P. Connor 8, J. Klein 7, P. Kenan 4, J. Howard 7. Grainger first, Schermerhorn second, Godfrey third.

NATIONAL GUN ASSOCIATION TOURNAMENTS.—Special Notice.—Members desirous of organizing tournaments in their vicinity, under the auspices of the Association, are requested to notify the undersigned. All the expenses of the same will be paid by us. Make your arrangements for 1886. We propose to establish a circuit of tournaments annually. Claim your dates now.—F. C. BISHOP, Secretary, Box 1292, Cincinnati, O. Send 10 cents for hand book containing rules, constitution, etc. "Fairly started and its future depends entirely upon the manner in which the sportsmen throughout the country respond."—C. M. STARK, April 18, 1885.—*Adv.*

Canoeing.

Address all communications to the Forest and Stream Publishing Co.

CANOEISTS *are invited to send us notes and full reports of cruises, club meets, information about canoeable waters, and other communications of interest.*

FIXTURES.

Aug. 29—Buffalo C. C. Races.
Sept. 5—Buffalo C. C. Races.
Sept. 19—N. Y. C. C. Regatta, off New Brighton.
Sept. 26—Jersey City Y. C., Canoe Race.

BUFFALO C. C.

THE first of a series of three races of this club took place Aug. 22 the course being from the club house to the Bedell House dock, about four miles down the river. The prizes for the series are: First, an A. C. A. badge, presented by William Lansing; second prize a Merriam life belt, presented by Capt. Wood; third prize, a canoe binnacle also presented by Mr. Lansing. The canoes shall score by points, and the canoe having the highest number of points to its credit shall be deemed the winner of the series and the next highest the second and so on, thus the first canoe in each race that crosses the finishing line shall count four, the second three, the third two and the fourth one, all other canoes entered shall not count. By this system all canoes have an equal chance and no canoe will be especially favored, as the weather is unlikely to be the same on all the dates. In Saturday's race the following canoes started and finished in the order named: Otter....Williams Lansing ...Mohican No. 1...65ft...Radix Board. Nellie....Frank E. Wood.....14.6×30.....55ft...3in. keel. Helene..Henry L. Campbell...14.8×30.....52ft...Folding Board. Elf.....Edwin L. French.....14. ×30.....60ft...1in. keel.

At 5 o'clock the canoes started, all being well together but Elf, who did not hear the word and was about a minute later.

The wind had been blowing quite fresh from N. W. all day, but after starting it lulled down and it was then a race to see which canoe would drift fastest, for the current in the Niagara River averages three to four, and in some places it flows seven and eight miles an hour. All were bunched for fifteen minutes and then the Captain with his high Mohican sails caught a breeze and sailed away ahead of the rest, which lead he kept and would have won the race but went too far down stream and had to work slowly back, but Otter kept well to the Grand Island shore and drifting down let his sail catch on the lower end of the dock and swung in, thus winning the first race. Elf passed within two hundred feet of the finishing line, but his case was hopeless as the wind was shut out by the hotel and trees and he was soon a half a mile below, but by edging in from the current he soon regained his former position near the dock but not until after Nellie and Helene had finished.

Helene is a new canoe and this was her first day in the water, and her owner is quite proud of her as he designed and built her himself. She is fitted with several things of his own invention, among which is a folding centerboard that houses in a box under the floor and is raised and lowered by a simple contrivance aft of the forward bulkhead and does away with a handle that soon finds your backbone if you sleep in your canoe. Also a novel foot steering arrangement, and last but not least, his leg-o'-mutton sails, which by one pull his dandy is brailed up and his mainsail is reefed or furled.

Mr. Campbell used his cruising rig on this day, as he is yet unaccustomed to Helene, and all the participants expected an easy victory; but previous nautical experience enabled him to shut out one canoe and make it close for the leaders. But after all the race can hardly be called more than a fluke, as it was a mere drift; but more wind is hoped for next week.

IANTHE C. C. REGATTA.

THE Ianthe C. C., of Newark, N. J., held their first regatta on Aug. 22, on the Passaic River, at Newark. The first race, for canoes 24in. and under, paddling, had four entries, 1 mile:

Achilles	George Cox.....Essex C. C.
Frolic	W. F. Marvin.....Ianthe C. C.
Priscilla	W. Burling.....Ianthe C. C.

Achilles won in 12.50. The prize was a silver cup.

The paddling race for canoes of 24 to 28in. beam was won by Wm. Hillier, Essex C. C., in 12.57.

The tandem race, 1 mile, for a pair of paddles, had four entries:

Water Witch	Hurd and Garrett.....Bayonne C. C.
	Oliver and Collins.....Bayonne C. C.
Allegretto	Marvin and Honess.....Ianthe C. C.
Montauk	Hillier and Totten.....Essex C. C.

Won by Oliver and Collins in 12.40.

The last race, for canoes over 28in., was won by Clinton Day in the Dolphin, from George Cox in the Ianthe. As there was no wind, the sailing race was abandoned.

PITTSBURGH C. C.—Some of the members of the P. C. C. are interested in the regatta and "Feast of Lanterns" to be held by the South Fork Fishing and Hunting Club, on Conemaugh Lake, on Saturday next. The programme includes, among other events, a sailing race for canoes, a tandem race, upset and hurry-scurry races, to conclude with an illuminated water parade of all the boats and canoes.

THE AMERICAN CANOE ASSOCIATION.

THE 1885 meet at Grindstone Island, July 25 to Aug. 8. Moonlight the first week. Races began Monday, Aug 3, second week. (For the official programme of the races see FOREST AND STREAM for Aug. 13). First and second prizes—flags presented by members of the Association and others—were given in all races with more than two starters. Five prizes were given for Records.

Regatta Committee: R. W. Gibson, Albany; J. L. Weller, Peterboro; R. J. Wilkin, Brooklyn.

The tables of races are given in the order of the programme, although not occurring in that order at the meet on account of the weather. The date of each race is printed above it, also the dimensions of canoes defining the class to which they belong.

MONDAY A. M., AUG. 3—RECORD RACE.

Event 1.—Paddling, Class III., 1 mile with turn. Length not over 17ft., beam not under 28in.

Owner.	Club.	Canoe.	Size.	Place.	Time.	Record points.
M. F. Johnson...	Toronto ...	Invincible..	16 ×28⅜	1	15 30	10
Theo. Dunham..	Harvard ..	Beatrice...	14.2×29	2	19 00	5½
E. Gould.....	Knickerbkr	Hilcrest....	15 ×28	upset	.. ..	.. ..

Johnson won, Dunham took second prize. Strong headwind over half the course.

TUESDAY A. M., AUG. 4—RECORD RACE.

Event 2.—Paddling, Class II., 1 mile, with turn. Length not over 15ft., beam not under 26in.

Owner.	Club.	Canoe.	Size.	Place.	Time.	Record points.
W. A. Leys.....	Toronto ...	Ariel	14.3×26	1	13 50	10
G. E. Edgar, Jr..	Dock Rat..	Day Dream	14.10×26	2	14 30	5½
R. Baldwin.....	Ottawa	Irene	15 ×27⅞	3	15 05	1

Leys won. Edgar took second prize.

Event 3.—Sailing, Novices, canoeists never having sailed a canoe before 1885. Any canoe, 1½ miles, triangular course, once around:

Owner.	Club.	Canoe.	Size.	Place.	Time.
H. Stanton.....	Knickerbocker	Flit.....	15 ×30	1	19 00
F. M. Turner	Brookville.....	Emily.....	15.5×30¼	Upset.	.. ..
E. K. Dunham..	Harvard.....	Margaret..	14 7×31	Upset.	.. ..

Heavy wind and rough water. Mr. Stanton won the prize and made the best sailing time once around the course during the meet, having full sail breeze and from a quarter making but two tacks necessary on the windward side of the course. He managed his canoe like a veteran sailor.

WEDNESDAY P. M., AUG. 5—RECORD RACE.

Event 4.—Paddling, Class IV., 1 mile with turn. Length not over 16ft., beam not under 30in.

Owner.	Club.	Canoe.	Size.	Place.	Time.	Record points.
W. F. Kipp.....	St. Law'ce.	Nellie.....	14.6×30¼	1	13 00	10
J. L. Jaekson....	.....	Bijou	14 ×29¾	2	13 30	8 1-5
R. W. Gibson	Mohican...	Snake.....	14.6×30⅝	3	14 00	6 2-5
J. R. Robertson..	St. Law'ce.	Gertie.....	15 1×30⅜	4	.. ..	4 3-5
G. O. Totten, Jr .	Essex	Daisy.....	15.2×30¼	5	.. ..	2 4-5
E. B. Edwards...	Peterboro..	Verena	16 ×30	6	.. ..	1

Kipp won, and Jackson of same club took second.

THURSDAY P. M., AUG. 6.

Event 5.—Paddling, Class I., 1 mile with turn. No limits to size of canoe.

Owner.	Club.	Canoe.	Size.	Place.	Time.
M. F. Johnson. ..	Toronto.....	Maggie	18 ×22½	1	12 00
W. A. Leys.....	Toronto.....	Ariel.....	14.3×26	2	12 22

The best time over the course last year was made by Mr. Johnson in the canoe Maggie, 1½ miles, time 14.48 or 9.52 to the mile. Tandem, 1 mile in Maggie was recorded as 9.31. Unfavorable weather prevented good time this year.

TUESDAY P. M., AUG. 4—RECORD RACE.

Event 6.—Sailing, Class B, 3 miles, triangular course, twice round. Length not over 17ft., beam 28½in. for that length; ⅛ of an inch beam can be added for each inch of length decreased.

Owner.	Club.	Canoe.	Size.	Place.	Time.	Record points.
C. B. Vaux.....	New York.	Sea Bee.. ..	15 ×29⅜	1	50 30	10
R. W. Gibson....	Mohican...	Snake.....	14.6×30⅝	2	52 00	9 7-16
F. S. Rathbun...	Deseronto..	Star	14.2×29	3	55 00	8 14-16
Robert Tyson....	Toronto ...	Isabel.....	13.11×32½	4	.. ..	8 5 16
B. W. Richards..	Brockville.	Grebe.. ..	15 ×31	5	.. ..	7 12-16
C. F. Holdship..	Pittsburgh.	Freyja.....	14.5×30½	6	.. ..	7 3 16
Geo. O. Totten..	Essex.....	Daisy.....	15.2×30¼	7	.. ..	6 10-16
E. B. Edwards...	Peterboro..	Harvard...	16 ×30	8	.. ..	6 1-16
A. G. Webster...	Harvard...	Germaine..	15½×31	..	.. ..	upset
R. W. Bailey....	Pittsburgh.	Katrina	14.7×31	..	.. ..	retired
C. V. R. Schuyler	Brooklyn..	Guenn.....	15.2×31	..	.. ..	disable
T. Dunham.. ...	Harvard...	Beatrice....	14.2×29	..	.. ..	upset
J. E. Mellen.....	Rochester..	Bertha.....	14.2×29¾	..	.. ..	retired
C. A. Neidé.....	Mohican...	Aurora	15 ×31½	..	.. ..	retired
F. F. Andrews..	Rochester..	Sofronia...	15 ×30	..	.. ..	upset
P M Wackerhag'n	Mohican...	Thetis.....	14.4×30¼	..	.. ..	retired
E. W. Brown....	Knickerb'k	Inertia.....	15 ×30	..	.. ..	retired

Vaux won, Gibson taking second place. Heavy wind and sea all through the race. ½ mile in each round a dead beat to windward. A squall passed over the bay during first round. The jibe at the first turn proved fatal to some. The cautious ones tacked round this flag to avoid danger of jibing.

RECORD RACE.

Event 7.—Sailing, Class A, 3 miles, triangular course, twice round. Length not over 16ft, beam not under 28in.

Owner.	Club.	Canoe.	Size.	Place.	Time.	Record points.
A. K. Nimick....	Pittsburgh.	Nirvana..	14 ×27½	1	55 30	10
G. E. Edgar, Jr..	Dock Rat..	Day Dream	14.1×26	2	63 30	7
R. W. Baldwin..	Ottawa....	Irene.....	15 ×27¾	..	.. ..	upset
Ford Jones.....	Brockville.	Irex	14.6×27⅝	..	.. ..	upset

Nimick won. Edgar second. This race was started ten minutes after Class B, and, therefore, sailed in same weather. Nimick came in ahead of several of the B class who finished. In 1884 eight canoes started and finished in the Class A race. It is notable that the A class is getting less popular.

RECORD RACE.

Event 8.—Paddling and sailing combined, 3 miles, triangular course, twice round, Classes A and B together. Paddle ½ mile, sail ½ mile, paddle ½ mile, sail ½ mile, paddle ½ mile, finish by sailing ½ mile:

Owner.	Club.	Canoe.	Size.	Place.	Time.	Record points.
R. W. Gibson ...	Mohican...	Snake.....	14.6×30⅝	1	50 20	10
G. E. Edgar, Jr..	Dock Rat..	Day Dream	14 1×26	2	60 00	5½
C. A. Neidé.....	Mohican...	Aurora	15 ×31½	..	.. ..	Ret'd

Heavy wind and rough water prevented more men entering.

Event 9.—Paddling tandem, Classes III. and IV., decked canoes, 1 mile. Class III. length not over 17ft., beam not under 28in., Class IV. length not over 16ft., beam not under 30in. Prize to each man in winning crew of two.

Names.	Club.	Canoe.	Size.	Place.	Time.
W. F. Kipp.....	St. Lawrence	Nellie.....	14.6×30¼	1	13 00
J. L. Jackson	St. Lawrence				
J. R. Robertson..	St. Lawrence	Gertie.....	15.1×30⅜	2	13 05
C. V. R. Schuyler.	Brooklyn ..				
J. S. Davis.....	St. Lawrence	Jessie.....	15.½×31	3	.. ..
C. F. Smith.....	... .				

Kipp and Jackson took the prizes. Close race.

Event 10.—Paddling tandem, same as event 9, but open canoes only allowed. 1 mile.

Names.	Club.	Canoe.	Size.	Place.	Time.
M. F. Johnson....	Toronto	Invincible..	16 ×28⅜	1	13 00
G. B. Wilkinson..	Brockville ...				
A. C. Shaw	Brockville ...	Daisie	15.3×31	2	14 00
E. Pitt.....	Brockville ...				
K. Martin.....	Oswego.....	Ballyhack..	15 8×31¼	3	.. ..
J. W. Higgins	Oswego.....				

Johnson and Wilkinson won easily.

THURSDAY P. M., AUG. 6—RECORD RACE.

Event 11.—Upset race, Class II. canoes and larger, 200ft., at signal every canoe to be turned completely over.

Owner.	Club.	Canoe.	Size.	Place.	Record points
F. F. Andrews...	Rochester	Sofronia...	15 ×30	1	10
C. B. Vaux, ...	New York. . .	Sea Bee....	15 ×29⅜	2	8½
G. B. Wilkinson..	Brockville.....	Gunz	14.6×27⅜	3	7
M. F. Johnson...	Toronto.	Invincible..	16 ×28⅜	4	5½
R. W. Gibson	Mohican.....	Snake	14.6×30⅝	5	4
E. B. Edwards ...	Peterboro.....	Verena	16 ×30	6	2½
E. Gould	Knickerbocker	Hilcrest ...	15.11×28	7	1

Andrews won, and turned his canoe completely over without moving from the cockpit of his canoe. Invincible, Verena and Hilcrest were all open Peterboro canoes, the others were decked.

WEDNESDAY, AUG. 5—RECORD RACE.

Event 12.—Paddling, Class IV., cruising trim, canoe and load to weigh 200 pounds or more, 1 mile.

Owner.	Club.	Canoe.	Size.	Place.	Time.	Record points.
W. F. Kipp... ..	St. Law'ce.	Nellie.	14.6×30¼	1	11 30	10
R. W. Gibson....	Mohican...	Snake.....	14 6×30⅝	2	12 35	7
R. Martin.....	Oswego....	Ballyhack.	15.8×31¼	3	13 45	4
A. G. Webster...	Harvard...	Germaine..	15½×31	4	.. ..	1

Kipp won easily, Gibson got second prize.

Event 13 curiously did not appear on the original programme nor on any later edition. The Regatta Committee omitted it no doubt on account of its historical absence of luck, feeling sure no one could win in such an event.

WEDNESDAY, AUG. 5—RECORD RACE.

Event 14.—Sailing Class B, 3 miles, triangular course, twice around, no ballast.

Owner.	Club.	Canoe.	Size.	Time.	Place.	Record points.
P M Wackerhag'n	Mohican .	Thetis.....	14.4×30¼	51 40	1	10
F. F. Andrews...	Rochester.	Sofronia...	15 ×30	56 40	2	9¼
C. B. Vaux.....	New York.	Sea Bee....	15 ×29⅜	58 55	3	8½
B. W. Richards..	Brockville.	Grebe.....	15 ×31	.. ..	4	7¾
E. B. Edwards ..	Peterboro..	Verena	16 ×30	.. ..	5	7
R. W. Gibson....	Mohican...	Snake ..	14.6×30⅝	.. ..	6	6¼
R. S. Oliver.....	Mohican...	Marion B..	15 ×30⅞	.. ..	7	5½
F. S. Rathbun...	Deseronto..	Star	14.2×29	.. ..	8	4¾
R. W. Bailey ...	Pittsburgh.	Katrina....	14.6×31	.. ..	9	4
C. F. Holdship...	Pittsburgh.	Freyja.....	14.5×30½	.. ..	10	3¼
J. E. Mellen.....	Rochester .	Bertha.....	14.3×29¾	.. ..	11	2½
Robert Tyson ...	Toronto....	Isabel.....	13.11×32½	.. ..	12	1¾
Chas. A. Neidé..	Mohican...	Aurora.. ..	15 ×31½	.. ..	13	1

Thetis won, making up her long lead of five minutes entirely on the windward work. Sea Bee and Sofronia sailed a close race all through, passing each other four times. The wind was light and water smooth, with a dead beat to windward on second leg each time round. The famed Aurora got thirteenth luck.

RECORD RACE.

Event 15.—Sailing, Class A, same conditions as Class B.

Owner.	Club.	Canoe.	Size.	Time.	Place.	Record points.
A. K. Nimick. ..	Pittsburgh.	Nirvana....	14 ×27½	58 30	1	10
Ford Jones....	Brockville.	Irex	14.6×27⅜	66 15	2	8½
G. E. Edgar, Jr..	Dock Rat..	Day Dream	14 1×26	67 45	3	7

J. L. Rogers. ..	Wenonah..	Peterboro.	....	.. ..	18	1

Gibson won, Bailey second, light wind and smooth water. A close race all through

RECORD RACE.

Event 18.—Sailing, Class A, under same conditions as Class B.

Owner.	Club.	Canoe.	Size.	Time.	Place.	Record points.
A. K. Nimick....	Pittsburgh.	Nirvana....	14 ×27½	24 10	1	10
R. W. Baldwin..	Ottawa....	Irene.....	15 ×27¾	30 30	2	7¾
G. E. Edgar, Jr..	Dock Rat..	Day Dream	14.1×26	.. ..	3	5½
B. C. Bakewell..	Pittsburgh.	Lady Jane.	14 1×26	.. ..	..	..
H. W. Shaffer..	Essex.....	Nereid... .	14.7×28¼	.. ..	..	..

Nimick won, making his third straight race in Class A; Baldwin second. Nimick's time was 1m. 15s. better than the winning B canoe. A classs starting 10 minutes after B may have got a little better wind, but his performance in any event was very creditable. He beat the next boat in his class 6m. 20s.

RECORD RACE.

Event 19.—Paddling, Class III., cruising trim, 160lbs. canoe and load.

Owner.	Club.	Canoe.	Size.	Time.	Place.	Record points.
M. F. Johnson...	Toronto....	Invincible..	16 ×28⅜	11 25	1	10
E. Gould.....	Knickerb'k	Hilcrest....	15.11×28	11 32	2	1

Johnson won and made the best time over the course during the meet, though Kipp was within 3 seconds of him. This was a close race to the finish.

Event 20.—Sailing, for canoes over the limit, did not come off, as there were no entries. This is a fact worthy of note.

WEDNESDAY, AUG. 5.

Event 21.—Hurry-Scurry Race.

Owner.	Club.	Canoe.	Place.
G. B. Wilkinson....	Brockville.....	Gunz	1
M. F. Johnson.....	Toronto	Invincible	2
E. A. Gardner.....	Knickerbocker ...	Lorna	3
E. Gould	Knickerbocker ...	Hilcrest.....	4
E. W. Brown.....	Knickerbocker ...	Inertia.....	5

Though not ahead when the water was reached, by a splendid dive and strong swimming he reached and got away in his canoe first and won.

This finished the programme proper, as 22, gymnastics, were indulged in pretty much all the time, and no regular performance came off. A number of extra races were contested, and they are recorded below.

THE RECORD.

Place.	Name.	Points.	Canoe.	Races.

35	A. Webster	1.00	Germaine	2

* Kipp won a tandem race not in the record. Leys paddled against Johnson in Class I, being the only man entered against him, came in 22 seconds behind the winner over a mile course. Thirty-five

canoes and men competed in the record races. Leys and Kipp tied, Dunham and Shaffer tied, as did also Gould and Webster.

EXTRA RACES NOT ON OFFICIAL PROGRAMME.

FRIDAY, JULY 31.

Scrub sailing race, 3 miles, twice round regular triangular course; for a prize paddle offered by Mr. Rushton. This was the first race sailed over the course.

Owner.	Club.	Canoe.	Place.	Time.
R. W. Bailey	Pittsburgh	Katrina	1	49 00
P. M. Wackerhagen	Mohican	Thetis	2	50 00
C. B. Vaux	New York	Sea Bee	3	50 50
A. Webster	Harvard	Germaine	4	54 50
F. F. Andrews	Rochester	Sofronia	5	.. ..
C. G. Hutchinson	Brockville	Startle	6	.. ..
G. O. Totten	Essex	Daisy	7	.. ..
C. F. Holdship	Pittsburgh	Freyja	8	.. ..
Henry Shaffer	Essex	Nereid	9	.. ..
T. Dunham	Beatrice	Harvard	10	.. ..

Katrina won. Light wind and smooth water. A steamer cut Sofronia out of fourth place. It was a fairly close and pretty race all through, with constant passing and repassing of the canoes one with another.

FRIDAY, AUG. 7.

Consolation sailing race, 1½ miles, for canoe and man never having won an Association race. Prizes from Mr. J. H. Hull, Brooklyn. Value, $15 to first, $5 to second.

Owner.	Club.	Canoe.	Place.	Time.
C. V. R. Schuyler	Brooklyn	Guenn	1	45 20
B. W. Richards	Brockville	Grebe	2	45 30
G. O. Totten, Jr.	Essex	Daisy	..	.. ..
Henry Shaffer	Essex	Nereid	..	.. ..

Guenn won. Very light wind. The Grebe and Guenn had a very close race of it all through, Grebe making up on Guenn in the windward work but finally being passed by her running free on account of Guenn's very large and high sail. Five canoes started in the race. No record was kept of the fifth man, and the finish of the non-winning canoes not kept.

Cruising Canoe Race, 3 miles; first prize, from J. C. Wilson and Chas. Remington, a decorated paddle; second prize, from John Glendenning, a spoon paddle.

Owner.	Club.	Canoe.	Time.	Place.
P. M. Wackerhagen	Mohican	Thetis	0 58 30	1
C. V. R. Schuyler	Brooklyn	Guenn	1 04 30	2
B. W. Richards	Brockville	Grebe	.. ..	3
G. O. Totten, Jr.	Essex	Daisy	.. ..	4
Henry Shaffer	Essex	Nereid	.. ..	5

Thetis won almost by a whole leg of the triangle, beating Guenn 6 minutes, and all the gain was in the windward work, as reaching or running free Guenn had the advantage, if anything. Guenn and Grebe had a close race of it as in the consolation, and Daisy and Nereid kept together all round. It was a race of pairs, with Thetis single and ahead.

Sailing race for open canoes, 1½ mil es. Prize, decorated rudder from Mr. Ira Davis. Wind very light.

Owner.	Club.	Canoe.	Time.	Place.
E. B. Edwards	Peterboro	Verena	40 30	1
R. W. Baldwin	Ottawa	Irene	.. ..	2

Reaching sail race, any canoe, 1 mile with turn. The wind was so light it was made short. Pin for prize, presented by Mr. Hugh Neilson, Toronto. Over 10 canoes entered, but as it came off a flat calm nearly all withdrew. Nimick worked the Katrina over the course by swinging the sail and won. Andrews drifted about and hung on till a breeze sprang up and fairly sailed the entire distance.

Portage race, ½ mile, paddle, carry over fence and 100ft. on shore, for "Dorsal Fin" camp kit.

Crew.	Club.	Canoe.	Time.	Place.
Ed. Gould	Knickerbocker	Hilcrest	5 30	1
G. O. Totten, Jr.	Essex	Wenonah	5 45	2
R. W. Baldwin	Ottawa	Vida D.	.. ..	3
Chas. A. Neide	Mohican	Far Niente	.. ..	4
C. Laron	Berkeley	Dotakecare	.. ..	5
E. B. Edwards	Peterboro	Verena	.. ..	6

Edwards stood up on the gunwale of his canoe after the finish and paddled to shore in this position, a most difficult feat to perform.

A CRUISE ON THE POTOMAC.

Editor Forest and Stream:

The following account of his cruise on the Potomac was lately sent me in a private letter by an old cruising mate of mine, a member of the Washington C. C., and owner of the Tonic, a cruising canoe resembling the Sunbeam in model. Although not written for publication, I have his permission to contribute the description of his cruise to FOREST AND STREAM. SENECA.

* * * I went alone after all. M. sent me word the night before we were to start that he expected his father on during the week, so he would have to give up the trip. Unable to drum up any one to take his place, I started off by myself in the morning, intending to work down as far as Lower Cedar Point or Colonial Beach. When I left the float at 9 o'clock the wind was too light for sailing, so I paddled down to Long Bridge, where I found the breeze somewhat fresher. Just below the bridge I put up the sails and made a very good run to Marshall Hall. There the wind shifted around until it blew dead ahead, and after beating against it until 5 o'clock in the afternoon, I reached Hallowing Point, just opposite Craney Island, on the Virginia shore, twenty-three miles from the canoe club house. Here I cooked supper without going ashore and anchored for the night. In fact, I anchored about a dozen times and in as many different places before morning, in a vain attempt to escape from the clouds of hungry mosquitoes. I had neither netting nor tar oil, and it was too hot to admit of sleeping under a blanket, so nearly the whole night was spent in a constant fight with the miserable pests. Probably I slept about an hour altogether, but that hour was a picnic for them. They got their work in on me in good style, as was painfully evident next day by the hundreds of itching welts on my hands, arms and feet.

Soon after daylight I crossed over to Glymont and bought four yards of mosquito netting of which I made an A tent six feet long, two high and about three feet wide at the bottom. A cord sewed into the ridge served to fasten it up under my Mohican tent. It worked first-rate, and I had no further trouble with mosquitoes during the cruise.

With the wind still dead ahead I made another start, hoping to make a longer run than that of the day before, but 6 o'clock in the afternoon found me no further down stream than our old camping place opposite Quantico. I went ashore for a drink of water from the spring on the beach, and you may be sure it tasted good after my long sail in the hot sun. I met our red-headed friend of last year, and he gave me a very cordial welcome and a pressing invitation to sleep at his house. Carrying the grub-box ashore, I started a fire at the old fire-place, which still showed faint traces of our visit there, and cooked a good supper of coffee, bacon and fried eggs. I was compelled to bolt it down in short order, as a squall of wind and rain was coming up the river; and I hurried aboard, rigged up the storm suit of sails, and with a lively wind abeam ran across to the ducking club's island at the mouth of Chapawansic Creek. In the quiet water behind the island I cast anchor for the night, and, thanks to the mosquito bar, slept well until daylight.

After breakfast next morning I went over to Sandy Point for a supply of fresh water and once more headed down stream. The wind was dead ahead and so light that no headway could be made against the strong tide which was running, so the idea of reaching Lower Sandy Point was reluctantly abandoned and I squared away for Glymont. The wind was still aft and a little fresher when, at 5 in the afternoon, I rounded Indian Head. Occasionally glancing back over my shoulder I noticed that it was beginning to look rather black down in Occoquan Bay, but felt no uneasiness as I supposed it was only a little rain or wind which wouldn't reach me before a landing could be made in Glymont. A few moments later, when about a mile below the wharf, I took another look down the bay just in time to see two schooners dropping their sails. This time there could be no mistake as to its being a heavy squall, and I began to doubt being able to make the wharf before it came. While debating the question with myself a large schooner a few hundred yards abreast of me brought down her canvas with a run and let go her anchor. That settled it, and I thought it about time to snug down myself, so rounded up into the wind and got down my mainsail. While standing up to unrig the dandy the squall struck, and so hard as to almost snatch the dandy out of my hands. I hung on to it, however, but it was as much as I could do to get it rolled and stowed away under the deck without a capsize. My anchor was soon unfolded and overboard, but the line ran out to the last inch without its reaching bottom. I had only about 30ft., as D. accidentally cut it in half on the 20th of May cruise. Hauling her inboard again I bent on another piece of line but still could get no hold of the bottom. The wind was increasing every moment and a sea was beginning to get up, but my only fear for the Tonic was that she would drift ashore and be smashed up in the heavy surf. I was drifting rapidly and directly toward the wharves at Glymont, and it was not until I had passed the first that my anchor took hold. I tell you, old fellow, it was a severe test for the new anchor, for when she took fast hold of the bottom there was such a strain on the line that I was almost certain something would give way.

Seeing the rain coming I got out my apron and oilskin jacket, and was soon fixed for the storm, which turned out to be the heaviest I have ever witnessed on the Potomac. The rain came down in torrents, and for a few moments the view of the shore was entirely shut off. The waves were immense, and the surf on the beach only a hundred yards to leeward was five or six feet high. The dear old Tonic was behaving so well that I really enjoyed the storm, now that I found my anchor holding firmly, and when some men came out to my rescue in a big boat I took a heap of satisfaction in telling them that I was all right, and they had better go ashore out of the wet. They were considerably astonished to see how gallantly the little craft rode the big rollers, and I guess the good qualities of a well-built and equipped canoe are fairly well acknowledged in that locality now. When they got back to shore I noticed that a half dozen pair of strong arms were required to beach their boat without damage, and the whole crowd were drenched to the skin.

The storm lasted only about half an hour, and as soon as the wind had lulled sufficiently I sailed over to Craney Island, where I hauled out well above high water mark. I had just got comfortably settled for the night when we had another blow and rain, not so severe as the last, but it would have given me trouble had I been afloat with my tent up. Rolling up the curtain on the lee side of the tent I lay back to enjoy the sensation of being well sheltered from the wind and rain.

My Mohican tent is a success, and I don't believe a better one could be devised. It is roomy, easily and quickly set up, and, best of all, weather proof. The rain continued at intervals nearly all night, and as the weather was threatening in the morning I remained on the island until noon, spending the time cleaning up, fishing, etc. I caught fifteen or twenty white perch, five of the largest making a good dinner.

In the afternoon I donned my best blue suit and red necktie, and again went over to Glymont. I was met at the landing by quite a crowd, which had assembled for a near inspection of the little craft that had proved herself so seaworthy the day before, and I was kept busy answering all sorts of questions respecting her. Most of the crowd were fishermen, and they made no effort to conceal their admiration for a craft they had hitherto regarded with some contempt. It cost me something considerable for the beer and whisky the fellows who so kindly came out in the rain to my assistance got outside of, but I didn't mind that much, as I was glad of the opportunity to establish a record on the river for the rather despised canoes.

I laid in some stores here and again crossed the river to Hallowing Point. I hauled the Tonic ashore near a huge mulberry tree which was loaded down with ripe fruit, and made my supper almost entirely of mulberries. Just at dusk while sitting in front of the fire, I saw something moving about under the mulberry tree. A cautious inspection revealed a pair of woodcock, who were enjoying a feast on the fallen berries which lay an inch or more deep on the ground. I stood within six feet of them and was compelled to go even closer and clap my hands before they took wing. Going back to the fire I had hardly got seated when I saw them there again, where they remained unmolested till they had got their fill. It was my first sight of a live woodcock, and having heard so much of their extreme shyness I was greatly surprised to be able to get so near them.

Getting under way about 9 next morning, with a light breeze aft, I reached Marshall Hall at noon and in time to get a glass of beer before the Mary Washington landed her horde of noisy excursionists. From there to Fort Washington was a hot paddle under a scorching sun, and it was 4 in the afternoon before the Tonic pushed her forefoot fast into the mud at C. F.'s landing. Taking my pail and grub-bag I strolled up to the mansion on the hill for milk, eggs, etc., and had quite a chat with the old people, who made many inquiries after you. The tide was way out when I got back to the landing, so I decided to anchor the Tonic out and sleep ashore. It was so pleasant that I only put up the mosquito tent, and it was a God-send, for the pests were thicker here than anywhere else on the whole cruise.

After a slow and uneventful run the next day (Friday) I reached the float at 4 P. M. and went home, intending to get my wife and the youngsters to spend the next day on a picnic up the river. She couldn't very well go, however, so I hunted up Mac, and at 1 P. M. we loaded our traps aboard the Herald for a trip up to the dam. While at Holtzman's we sighted the Scalp and the Canvasback coming down stream, manned by Bob and Bert, whom we induced to join us. They went home for their camping traps and promised to be with us before midnight. Mac and I kept a big fire going on Sycamore Island to show them where to find us, as neither of them had ever been up the feeder before. We had about given them up when about 11:30 our ears were greeted with their yells down the dam. The night was delightful, and we slept before a good fire of green logs without needing tents or blankets. Next day was cool and breezy, and we had a most pleasant time. No bass were caught, though we tried for them faithfully in the most likely spots. Our trip down was made late in the afternoon, and was very enjoyable.

Yachting.

FIXTURES.

Aug. 27—Jersey City Y. C., Ladies' Day.
Aug. 29—Quincy Y. C., Third Club Race.
Aug. 29—Beverly Y. C., Swampscott Third Championship Regatta
Sept. 5—Hull Y. C., Champion Race.
Sept. 5—Larchmont Y. C., Fall Pennant Regatta.
Sept. 7, 9, 11—America Cup Races.
Sept. 9—Beverly Y. C., Nahant, Fall Regatta.
Sept. 12—Quincy Y. C., Third Championship Race.
Sept. 12—Boston Y. C., Fourth Club Race.
Sept. 12—Corinthian Y. C., Fall Matches.
Sept. 14—Newark Y. C., Open Regatta.
Sept. 15—N. Y. Y. C., Bennett and Douglas Cups.
Sept. 17—N. Y. Y. C., Brenton's Cup Race.
Sept. 19—Beverly Y. C., Nahant.
Sept. 19—Hull Y. C., Champion Race.
Sept. 19—Pentucket Y. C., Union Regatta.
Sept. 23—N. Y. Y. C., Cape May Cup Race.
Sept. 28—Pentucket Y. C., Championship Regatta.

JERSEY CITY Y. C. CANOE RACE.—A canoe race to be held under the auspices of the Jersey City Y. C. will be held on Saturday Sept. 26, at 2 P. M. All canoeists are invited to enter. The race was to have been sailed June 25, but as only two canoes were present it was agreed to postpone it until September. The course will be from the club house to and around a stakeboat near the S. E. corner of Black Tom, thence around a stakeboat near Ellis Island, and to start ing point, around the course twice, leaving all stakeboats to port. All entries to be made to S. B. Crane, 311 Second street, Jersey City. Allowance one minute to the foot.

THE CUP RACES.

THE programme for the series of races with Genesta for the America Cup has been issued, as follows:

These races have been fixed for Monday, Sept. 7; Wednesday, Sept. 9, and, if a third race becomes necessary, Friday, Sept. 11. Best two out of three to win.

A steamer will be provided for the exclusive use of members of the club and ladies accompanying them for each day's race.

Tickets for each person for admission to the boat, including luncheon, can be obtained for each day on application in person or by mail to the Secretary at the club house, 67 Madison avenue, on payment of $1.

Members are requested to send in their applications as soon as possible, and prior to Saturday, Sept. 5, stating the number of ladies' tickets required, in addition to their own, and the days for which they are wanted, so that adequate provision may be made.

NOTE.—Should the third race be necessary, the tickets for the same may be obtained at the club house on the payment of $1.

Should any postponement take place or a race have to be sailed over on account of failure to make it in the prescribed time, the arrangements for that day will be repeated, and tickets may be obtained before leaving the boat from the members of the committee in charge, or at the club house, on the payment of $1.

FIRST RACE.—Monday, Sept. 7. Twenty miles to windward and back, outside Sandy Hook. The iron steamer Taurus will leave Pier 1, North River, punctually at 8:30 o'clock A. M., calling at Stapleton, Staten Island, at 9 o'clock A. M.

SECOND RACE.—Wednesday, Sept. 9. Over the usual club course. The steamer will leave the same places at 9 and 9:45 A. M. respectively.

THIRD RACE.—If this race takes place it will be over a triangular course outside Sandy Hook, and the steamer will leave as on the first day.

Each day on returning, the steamer will stop at the same places.

J. F. TAMS,
CHARLES H. STEBBINS, } Regatta
JULES A. MONTANT, } Committee.

The Seawanhaka C. Y. C. will also have a steamer for their members; the Oswego Y. C. and Mr. N. L. Stebbins, the Boston photographer, have each engaged tugboats, and some of the Iron Steamboat Co.'s boats will also go over the course.

THE TRIAL RACES, AUG. 21, 22, 24.

FOR three days of last week a long string of pilgrims made their way from the screw dock on South street next to the little floating Bethel, to the balance dock further up at Governeur Slip, while another string passed them in the opposite direction. Both parties were bent on seeing the two yachts that have been built to keep the America's Cup in this country in spite of the efforts of the cutter Genesta to recapture it. On the middle berth of the screw dock lay the white and black hull of the Boston boat with a throng of critics, mostly favorable, about her all the time. Half a mile further up lay Priscilla, also holding a reception of yachtsmen of all ranks, owners, skippers, sailors, while among the visitors were many not interested in yachting, but curious to see the two boats already so famous. The races in the East had been far from satisfactory, showing indeed that alterations were needed in Priscilla and that until they were made, at least, Puritan was the better boat; but as we showed last week, no conclusive and thorough tests of old and new boats were made on the cruise. To make such tests in a way to guide them in the selection of the best boat, the Cup Committee arranged for a series of trial races open to all yachts of 60ft. waterline and over, to be sailed over nearly the same courses as the Cup races of next month, and all sloops and cutters were invited to enter. While there was little probability that any other than one of the two new boats would be selected, the Committee desired as many entries as possible for the purpose of a thorough comparison; but of all our sloop fleet, only Gracie and Bedouin cared to start.

Both of these yachts are too well known to need any further description. Gracie, a centerboard sloop of the old type, once the fastest of American sloops, 70ft. waterline, 79ft. 10in. over all, 21ft. 6in. beam, and 6ft. 6in. draft. A sloop in rig, but with double headsails for several years past. Built in 1868, and since rebuilt and altered out of all likeness to the original boat, for many years she has held a place that was only questioned with the advent of Mischief in 1879, since which time she has fought many a battle, of late mostly losing ones, for first place.

Bedouin, though but in her fourth season, is no less widely known among yachtsmen as the largest cutter in America, and for at least two seasons past as the fastest single-stick boat. She too is 70ft. on waterline, but 83ft. over all, 15ft. 6in. beam, and 11ft. 6in. draft; of course with lead keel and full cutter rig. Both of these boats have met many times, the odds being at first in Gracie's favor, but of late the cutter has been victorious, so that a battle between them is always interesting; in the present series being still more so, as a purse of $200 per side on each race was put up by the owners. As these two with Mischief constitute the cream of the old fleet, they offer a standard by which to measure the two newer vessels.

Of these the New York yacht Priscilla, designed by Mr. A. Cary Smith for Com. Bennett and Vice-Com. Douglas, is in model a centerboard in all respects, though differing somewhat from Mischief as the latter in turn does from Gracie, Fanny, Arrow and other boats, in accordance with the ideas prevalent of late years. In rig it is more difficult to classify her, but while many of the details of gear and rigging are taken directly from the cutter, the proportions of sails and spars are essentially those of the sloop rig. Her length on waterline is 85ft., over all 94ft., beam 22ft. 3in., and draft 7ft. 9in. without board. Of the four she is the only one built of iron, the others being of wood.
